19/21+21/19	22+22	21+22	23+22	172

***Theory:** Assignments and regularity will be evaluated out of 10 (ten) marks in a semester.
Practical: Practical record and regularity will be evaluated based on Viva/quizzes 4 (four) times in a semester. Each evaluation will be out of 10 (ten) marks.

**** Theory:** Two mid-term examinations of 20 (twenty) marks each.
†Evaluation of proficiency will be based on the participation in co-curricular activities.
†† Students will go for an industrial training program of 8 (eight) weeks in the summer after the end of the III year spring semester examination.

B. Tech. Electrical Engineering

Four Year B. Tech. Programme

Academic Curriculum (2015-16 onwards)

List of Technical Electives

III Year Spring Semester (Industrial Elective)

S. No.	Course Code	Course Title
1.	EC-15.312	Advanced Radio Access Network (ARAN)
2.	EE-14.305	Power Plant Engineering
3.	EE-14.310	Reliability of Electrical Power System

List of Technical Electives

IV Year Autumn Semester (Elective -I)

S. No.	Course Code	Course Title
1.	EE-14.411	Smart Grid
2.	EE-14.413	Modern Control System
3.	EE-14.415	Power Quality
4.	EC-14.413	FPGA Architecture and Applications
5.	EE-14.404	Renewable Energy Systems

IV Year Spring Semester (Elective -II)

S. No.	Course Code	Course Title
1.	EC-14.306	Microcontrollers & Embedded Systems
2.	EE-14.412	EHV AC & DC Transmission
3.	EE-14.414	Computer Applications in Power system
4.	CS-14.305	Logic in Computer Science

EE-14.201 **Network Analysis & Synthesis** **Total Lectures: 40**
3-1-0-4

Objective: This course helps in analysis of A.C & D.C circuits and it also help to design the circuit models for the minor and major projects.

Prerequisite: Knowledge of Laplace transformation

1. **Development of Circuit Concept:** Introduction, capacitance, inductance and resistance parameters, approximation of a physical system as a circuit, reference directions for current and voltage, voltage and current sources, active element conventions, dot convention for coupled circuits, topological description of networks, linear graphs of a network and its parts, loops and trees, incidence matrix, cut-set matrix and tie-set matrix. [8]
2. **Network Equations**: Kirchhoff's laws, minimum number of network equations, source transformations, formulation of network equations, loop variable analysis &node variable analysis and duality. [6]
3. **Analysis of RLC Circuits**: Laplace transformation, some basic theorems for the Laplace transformation, transient response of RL, RC and RLC circuits using Laplace transform with D.C input and A.C. with sinusoidal input, partial fraction expansion, and solution of problems by Laplace transformation. [8]
4. **Network Theorems**: Superposition and reciprocity theorems, Thevenin and Norton theorems, Millman theorem, Tellegen theorem, and maximum power transfer theorem, application of these theorems to networks with a.c and d.c excitation. [8]
5. **Two Port Network**: Two port parameters, impedance, admittance, hybrid, inverse hybrid, transmission parameters, relationship between various parameters, reciprocity and symmetry of two port network, inter connection of two port networks. [6]
6. **Synthesis of Passive Network**: Hurwitz polynomials, positive real functions, elementary synthesis procedures, properties of LC immittance function, synthesis of LC driving point immittance, properties of RC driving point impedances, synthesis of RC impedances or RL admittances, properties of RL impedances and RC admittances, synthesis of RLC functions. [6]

Course Outcome: Upon successful completion of this course, students should be able to:

- Gain fundamental knowledge of the basic electrical elements such as resistance, capacitors and inductances.
- Understand circuit representation as graphs and implementation of KVL and KCL in the circuits and to solve the circuit problems by Laplace transformation method and also by applying various networks theorems.
- Analyze small RLC circuits by hand. Use network techniques, like node analysis and loop analysis, to write equations for large linear circuits.
- Apply Thevenin and Norton theorems and concept of linearity and superposition to analyze and design circuits and networks.

Text Books:

1. M. E. Van Valkenberg, "Introduction to Modern Network Synthesis", Pearson, 3rd Edition, 2016.
2. A. Chakrabarti, "Circuit Theory – Analysis and Synthesis", Dhanpat Rai & Co., 6th Edition, 2010.

Reference Books:

1. A. Sudhakar and S. P. Shyam Mohan, "Circuits and Network Analysis and Synthesis", McGraw-Hill, 5th Edition, 2015.
2. W. H. Hyatt Jr. and J. E. Kemmerly, "Engineering Circuits Analysis", McGraw-Hill, 7th edition, 2010.

EE-14.203 **Electrical Machines-I** **Total Lectures: 43**

3-1-0-4

Objective: This course facilitates the students to get a comprehensive exposure to the working principles, construction details and performance of D.C machines and Transformer.

Pre-requisite: Electrical Engineering course of First Year.

1. **Basic Concepts of Electrical Machines:** Introduction, Electromagnetic induction, flux linkage, statistically and dynamically induced emf, Classification and description of electrical machines, Heating and cooling of electrical machines. [4]
2. **Elements of Rotating Machines**: Introduction, Basic Components, Rotor, Stator and field excitation. Generator and motor action, EMF and torque equations, Leakage flux, Losses and efficiency, Rating and loss dissipation, Electrical and mechanical degrees. [5]
3. **Introduction to D.C. Machines:** Constructional parts of d.c. machines and their function, Principle of operation, Armature winding- Lap and wave, Simplex and duplex, Method of excitation, Classification, Derivation of emf and torque equations, Process of commutation, Armature reaction, Interpoles, Compensating winding and equalizer rings. [6]
4. **D.C. Generator**: Operating characteristics- Magnetization, Internal and external characteristics, Critical resistance and critical speed, Process of building up of voltage, Causes of failure of voltage build-up and remedies, Parallel operation of d.c. generators, Applications. [6]
5. **D.C. Motor**: Basic equation for voltage, Power, Torque and speed, Condition for maximum power, Operating characteristics- Torque-current, Speed-current and Torque-speed characteristics. Comparison, Starters, Speed control methods, testing of d.c. machines-Swinburne, Hopkinson's and Series field tests. Calculation of efficiency, Applications. [6]
6. **Transformers**: Principle of operation, Construction and practical considerations, Ideal and physical transformer, emf equation, Transformation ratio, Phasor diagram. Performance analysis, Equivalent circuit, Losses and efficiency, Condition for maximum efficiency, Determination of equivalent circuit parameters by O.C. and S.C. tests, Per unit calculation, Polarity test, Voltage regulation, All day efficiency. [10]
7. **Transformer Connections and Operation**: Back-to-back test, Parallel operation, Autotransformer, 3-phase transformer, Vector group, Three-phase transformer connections- Star-star, Delta-delta, Star-delta, Delta-star, Zig-zag connections, Scott connection, Open delta connection, Transformer cooling. [6]

Outcome: Graduates will have the knowledge of DC Electric motor, DC Generator and Transformer. They will understand how these motors are operated for applications.

Text Books:

1. D.P. Kothari and I.J. Nagrath,. "Electric Machines", McGraw-Hill, 2nd Edition, 2004.
2. P.S. Bimbhra, "Electrical Machinery", Khanna Publishers, 5th Edition, 2013.

Reference Books:

1. A.E. Fitzgerald, Charles Kingsley and Stephen D.U Electric Machinery, Mc Graw-Hill, 2nd Edition, 2003.
2. J.B. Gupta, Theory and Performance of Electrical Machines, S.K. Kataria and Sons, 3rd Edition, 2002.

MA-14.201 **Applied Mathematics** **Total Lecture: 40**

3-1-0-4

Objective: To acquire fundamental knowledge of linear programming, numerical methods, complex analysis and integral transform and apply in engineering disciplines.

Pre-requisite: Engineering Mathematics

1. **Linear Programming:** Introduction**,** Graphical method (bounded &unbounded solutions); Simplex method, Artificial variable technique (Two phase method, Big –M method); Assignment problem (Hungarian method); Transportation problem (Vogel's approximation method). **[12]**

2. **Numerical Methods:** Solution of system of equations (Gauss elimination and Gauss - Seidel methods);Solution of algebraic and transcendental equations (Bisection, Ramanujan's and Regula Falsi methods); Solution of ordinary differential equation (Euler's modified, Milne's predictor & corrector Runge-Kutta methods). **[10]**

3. **Complex Analysis:** Function of complex variable, analytic function, Cauchy-Riemann equations(without proof), integration of complex functions, line integrals in the complex plane, Cauchy integral theorem(without proof), Cauchy integral formula(without proof), zeros and singularities of complex functions, residues. **[6]**

4. **Integral Transform**: Laplace transform and inverse Laplace transform, First and Second Shifting theorems, Convolution theorem (without proof), Solution of ordinary differential equations with initial conditions by Laplace transforms. Fourier series of periodic functions, even and odd functions, Fourier half-range series; Basics of Fourier transforms. **[12]**

Outcome: After completion of the course, students would be able to apply the knowledge of linear programming, numerical methods, complex analysis and integral transforms in engineering and solve curriculum problems.

Text Books:

1. Ramana B.V., "Higher Engineering Mathematics", McGraw Hill, 1st Edition, 2006.
2. Grewal B.S. & Grewal J.S., "Higher Engineering Mathematics", Khanna publishers, 39th Edition, 2005.

Reference Books:

1. Jain R.K. & S.R.K. Iyenger Advanced Engineering Mathematics, Narosa Publishing House, 2nd Edition, 2003.
2. Erwin Kreyszig Advanced Engineering Mathematics, 9th Edition, Reprint 2011.
3. Taha H.A., "Operation Research: An Introduction", Pearson, 10th Edition, 2016.

EC-14.201 **Electronic Devices and Circuits** **Total Lectures: 40**

3-1-0-4

Objective: To acquire fundamental knowledge of operation, design and application of various Electronic devices and circuits.

Prerequisite: Basic Electronics and Physics of electron.

1. **Junction Diode:** Junction breakdown**,** Current components in a p-n diode, Quantitative analysis of p-n diode characteristics and equivalent circuit, diode resistance, interconnections of diodes, transition and diffusion capacitance. [6]
2. **Transistors**: Operation of transistor, transistor current components, transistor circuit configurations, transistor biasing schemes and operating point stabilization, hybrid-pi model of BJT, low and high frequency models of JFET, MOS Devices - NMOS, PMOS and CMOS [11]
3. **Small Signal Amplifiers at Low Frequency:** Coupling schemes for multistage amplifiers, frequency response of coupled amplifier, RC coupled transistor amplifier, transformer coupled transistor amplifier, cascode circuits, Differential amplifier, Darlington amplifier. [7]
4. **Power Amplifiers:** Power amplifier circuits, class-A, class-B, class-AB, class-C, push pull amplifiers- class-A, class-B, Class- AB, complementary symmetry push-pull and quasi-complementary symmetry, push-pull amplifiers. [8]
5. **Oscillators:** Classification criterion for oscillation, tuned collector, Hartley, Colpitts, RC phase shift, Wien bridge and crystal oscillators, astable, monostable and bistable multivibrators, Schmitt trigger. [8]

Outcome: After completion of this course, students would be able to understand the working phenomena and applications of various electronic devices and circuits. Knowledge gained from this course would also be utilized to design different electronic circuits and devices.

Text Books:

1. Millman J. & Halkias C.C., "Electronic Devices and Circuits" McGraw Hill, 2nd Edition, 2010.

EE-14.221 Network Analysis & Synthesis Laboratory

0-0-2-1

Objective: This Lab course helps us to gain basic knowledge of principle, operation, application and design/verification of various Electrical components /devices/ circuits/theorems by conducting the experiments.

Prerequisite: EEE Workshop

1. To study the series and parallel connected resistive circuits.
2. To study the equivalent star of a delta connected resistive circuit and also the equivalent delta of a star connected resistive circuit.
3. To verify the Kirchhoff's current Law and Kirchhoff Voltage law.
4. To verify the superposition theorem using resistive circuit.
5. To verify the Reciprocity Theorem using resistive circuit.
6. To verify the Thevenin Theorem using resistive circuit.
7. To verify of Norton's Theorem using resistive circuit.
8. To verify of Maximum Power Transfer Theorem using resistive circuit.
9. To determine Z-parameter, Y-parameter and ABCD parameter of a given Two-port network.
10. To design a zero PCB for a given circuit to verify the Thevenin Theorem.
11. To find out the time- constant of RL-series circuit when connected to step function.
12. To find out the time constant of RC-series circuit when connected to step function.

Outcome: After completion of this lab course, students would be able to demonstrate the working phenomena and applications of various electrical components and circuits. Knowledge gained from this course would also be utilized in designing different electrical circuits/theorems and devices.

Text Books:

1. M. E. Van Valkenberg, "Introduction to Modern Network Synthesis", Pearson, 3rd Edition, 2016.
2. A. Chakrabarti, "Circuit Theory – Analysis and Synthesis", Dhanpat Rai & Co., 6th Edition, 2010.

Reference Book: Lab Manual.

EE-14.223 **Electrical Machines-I Laboratory**

0-0-2-1

Objective: The objective of the Electrical Machine Lab is to provide an exposure of operation of D.C. machines and transformers and give them experimental skill. It also aims to understand the generation of D.C. voltages by using shunt generator and study their performance. It also enables the students to understand the working principles of D.C. motors and their load characteristics and methods of speed control. It also enables students to test and performance of d.c. machines and transformers.

Prerequisite: EEE Lab

1. To conduct the open circuit and short circuit tests on the given single phase transformer and to pre-determine (i) equivalent circuit parameters (ii) voltage regulation and (iii) efficiency.
2. To connect the given three, single phase transformers as three phase bank in (i) star-star (ii) star-delta (iii) delta-delta and (iv) delta-star configurations.
3. To perform the no-load test on the given D.C. shunt motor to study its speed variation by (i) field control method and (ii) armature voltage control method.
4. To obtain the open citcuit characteristics of a separately excited D.C. generator at rated speed and to determine (i) critical field resistance at rated speed (ii) critical speed (iii) voltage built up by the generator at rated speed and (iv) to plot the O.C.C. at different speeds.
5. To conduct the load test on the given D.C. shunt generator and its internal and external characteristics.
6. To determine the no load losses and hence to predetermine the efficiency, at any desired load, of the d.c. machine running. (i) as a motor and (ii) as a generator
7. To conduct the polarity test on the given transformer and to operate two single phase transformers in parallel to share a common load.
8. To determine the efficiency of two identical d.c. shunt machines by Hopkinson's regenerative test.
9. To conduct the back-to-back test on the given two, identical single phase transformers and to pre-determine (i) equivalent circuit parameters (ii) voltage regulation and (iii) efficiency.
10. To connect the given two, single phase transformers in Scott connection so as to
    (i) Show that the secondary voltages are at right angles to each other
    (ii) Supply two phase load from three-phase supply.
11. To conduct:
    (i) Field's test on two similar mechanically coupled series machines.
    (ii) Compute efficiency at different outputs.

    Plot the following curves for the motor efficiency, torque and speed v/s output.
12. To determine the no load stray losses of a given d.c. shunt machine and to separate the mechanical losses from iron losses.

Outcome: Students will be convergent with transformer and d.c. machines and their testing and performance aspects.

Text Books:
1. J.B. Gupta, Theory and Performance of Electrical Machines, S.K. Kataria and Sons, 3rd Edition, 2002

Reference Books:
1. P.S. Bimbhra, "Electrical Machinery", Khanna Publishers, 5th Edition, 2013.

EC-14.221 **Electronics Devices and Circuit Laboratory**

0-0-2-1

Objective To acquire fundamental knowledge of operation, design and application of various Electronic devices and circuits by doing the experiments.

Prerequisite Electronic Workshop

1. To plot the diode characteristics and its dynamic resistance and cut-in Voltage.
2. Plot the characteristics of a Zener diode and find its dynamic resistance under reverse biased condition. Plot the Line-Regulation and Load-Regulation curve using Zener diode.
3. (a) To implement a diode clipper circuit which clips the positive peak of the input voltage (i) By 1V and (ii) By 3V? (For given sinusoidal input$V_{pp} = 4V, 1kH$).
   (b) To implement a diode clipper circuit which clips the negative peak of the input voltage (i) By 1.5V and (ii) By 2.5V.(For given sinusoidal input $V_{pp} = 4V, 1kH$).
4. (a) To implement a diode clamper circuit which clamps the positive peak of the input voltage to (i) zero reference voltage and (ii) a given voltage $1V$. (For given square wave input$V_{pp} = 10V, 1kH$).
   (b) To implement a diode clamper circuit which clamps the negative peak of the input voltage to (i) zero reference voltage and (ii) a given voltage 1.5V.(For given square wave input $V_{pp} = 10\,V, 1\,kH$.
5. To plot the frequency response of a emitter follower. (For given sinusoidal input $V_{pp} = 3V, 1kH$.
6. Design a Half Wave Rectifier circuit with and without capacitor filter, measure the rms and Dc values of output voltage and calculate the ripple factor for given sinusoidal input $V_{pp} = 10V\,, 1\,kH$.
7. To plot the input and output characteristics of a transistor in CE Configuration.
8. Design a two stage RC coupled transistor amplifier and calculate the gain. (for given sinusoidal input $V_{pp} = 200\,mV, 1\,kHz$).
9. To plot the characteristics of a UJT and find its peak voltage, peak current and valley voltage. Design a relaxation oscillator determine the frequency of oscillation and compare the practical frequency obtained with the theoretical frequency.
10. To plot the Transfer characteristics (for $V_{DS} = 5V$) and Drain (for $V_{GS} = -1V$) characteristics of a JFET in CS Configuration.

Outcome:

After completion of this lab course, students would be able to demonstrate the working phenomena and applications of various electronic devices and circuits. Knowledge gained from this course would also be utilized to design different electronic circuits and devices.

Text Books:
1. Millman J. & Halkias C.C., "Electronic Devices and Circuits" McGraw Hill, 2nd Edition, 2010.

Reference Book:
1. Lab Manual

CS -14.205 **C++ Programming** **Total Lectures: 40**
3-0-0-3

Objective: The objectives of the course is:

- To get a basic knowledge of object-oriented concepts.
- To master in programming related to classes inheritance using C++.

Prerequisite: CS-14.101,CS-14.111

1. **Object Oriented Programming:** Basic concepts of object-oriented programming, Structured versus object oriented programming, merits and demerits of object oriented methodology. **[5]**
2. **Beginning With C++:** Preprocessor directives, Variables, data types, constants, operators, scope resolution operator, memory management operators, decision and loop controls, arrays, strings, functions. **[5]**
3. **Classes And Objects:** Class definition, Structure versus class, accessing member functions within a class, data hiding, arrays within a class, static data and member functions, objects, friend functions and friend classes, constant member functions, pointers to members, constructors and destructor. **[7]**
4. **Overloading and Exception Handling:** Definition, unary operator overloading, binary operators overloading, overloading of new and delete operators, manipulation of string using operators, type conversion, overloading with friend functions, function overloading, error and exception handling. **[8]**
5. **Inheritance and Overriding:** Derived and base classes, type of inheritance, Derived class constructors and destructor, overriding member functions, public and private inheritance, virtual base classes, abstract classes, this pointer, virtual functions and pure virtual functions, static and dynamic bindings. **[8]**
6. **I/O Streams and The Standard Library:** Header files, I/O stream library, stream I/O for objects, File I/O **[4]**
7. **Templates:** Class templates, function templates, overloaded function templates, member function templates. **[3]**

Outcomes: On completion of the course, student should be able:

- To gain the basic knowledge on object oriented concepts.
- To understand the role of inheritance, polymorphism, dynamic binding and generic structures in building reusable code.
- To implement features of object oriented programming to solve real world problems.

EE-14.202 **Electrical Machines-II** **Total Lectures: 42**

3-1-0-4

Objective: This course facilitates the students to get a comprehensive exposure to the working principles, construction and performance of A.C machines and synchronous machines.

Pre-requisite: Electrical Machine-I

1. **Basic Concept of A.C. Rotating Machines:** Introduction to Armature winding, Integral slot and fractional slot winding, Distribution factor (K_d), Pitch factor (K_p) and winding factor (K_w). Production of rotating magnetic field, EMF and torque equations, Effect of tooth harmonics and methods of reduction. [4]
2. **Synchronous Generator:** Construction, Cylindrical rotor and salient pole rotor, Principle of operation, Excitation system, Effect of winding factor on EMF, Armature reaction, Circuit model, Phasor diagram, O.C. and S.C. tests, Short-circuit ratio, Determination of voltage regulation by synchronous impedance, MMF and zero power factor methods. [7]
3. **Performance Characteristics of Synchronous Generator:** Two reaction theory, Phasor diagram, Power-angle characteristic of synchronous generators, Synchronizing power and torque, Synchronizing methods, Parallel operation of synchronous generator, Effect of change in excitation and mechanical power input on load sharing, Operation of alternator on infinite bus bars, Slip test. [6]
4. **Synchronous Motor:** Construction, Principle of operation, Equivalent circuit, Phasor diagram, Circuit model, Effect of change in excitation on armature current and power factor, Starting of synchronous motor, Synchronous condenser, Hunting, Applications. [6]
5. **Induction Motor:** Introduction, Construction, Principle of operation, Slip and rotor frequency, Comparison with transformer, Equivalent circuit model, Representation of mechanical load, No load and blocked rotor tests. Torque and power output, Losses and efficiency, Separation of losses. [7]
6. **Performance Characteristics of Three-Phase Induction Motor:** Circle Diagram, Torque-slip characteristics, Effect of rotor resistance, Starting torque and maximum torque, Starting and speed control methods, Cogging and crawling, Introduction to induction generator, Applications. [6]
7. **Single-Phase Induction Motor & special machines:** Introduction, Double revolving field theory, Cross field theory, Torque-speed characteristic, Equivalent circuit model, Starting methods, Applications, Stepper Motor, and Reluctance motor. [6]

Outcome: The students shall develop an insightful knowledge on various ac motors and ac generators.

Text Books:

1. D.P. Kothari and I.J. Nagrath,. "Electric Machines", McGraw-Hill,2nd Edition, 2004
2. P.S. Bimbhra, "Electrical Machinery", Khanna Publishers, 5th Edition, 2013.

Reference Books:

1. A.E. Fitzgerald, Charles Kingsley and Stephen D.U Electric Machinery, Mc Graw-Hill, 2nd Edition, 2003.
2. J.B. Gupta, Theory and Performance of Electrical Machines, S.K. Kataria and Sons, 3rd Edition, 2002

EE-14.204 Electrical Measurement and Instrumentation Total Lectures: 40

3-0-0-3

Objective: To make students conversant with concepts of measurement and various electrical and electronics instruments, transducers and bridges.

Pre-requisite: Basic Electrical engineering, Basic Electronics Engineering

1. **Concepts of Measurements:** Introduction, accuracy and precision, repeatability, errors in measurement, sources of errors, types of errors, statistical analysis of measurement data, graphical representation of measurement, data as distributions, Gaussian graph and precision indices. [6]
2. **Analog Instruments:** Types of operating torques in an analog instrument, Moving coil, moving iron, electrodynamic and induction instruments-construction, operation, torque equation and errors. Shunts and multipliers. Applications of instruments for measurement of single-phase power and single-phase energy. Errors in wattmeter and energy meter and their compensation and adjustment. [6]
3. **Bridge:** DC bridges for measurement of resistance Wheatstone bridges, Kelvin's double bridges and AC bridges for measurement of L, R, C & M, Maxwell's bridges, Anderson's bridges, Weins bridges. [6]
4. **Electronic Instruments for Measuring Basic Parameters:** Electronic Voltmeter, Electronic Multimeters, Digital Voltmeter, Q meter, Vector Impedance meter, signal analyzers- wave analyzers, harmonic distortion analyzers and spectrum analyzers. [6]
5. **Potentiometers:** DC and AC potentiometers, Principles, Standardization and application. [5]
6. **Transducers:** Introduction , Classification, Selection Criteria, Characteristics, Construction, Working Principles and applications of following Transducers- RTD, Thermocouples, Thermistors, LVDT, RVDT, Strain Gauges, Tacho-generators, Piezoelectric Transducers, Ultrasonic Flow Meters. [6]
7. **Oscilloscopes:** CRT Construction, Basic CRO circuits, CRO Probes, Oscilloscope Techniques of Measurement of frequency, Phase Angle and Time Delay. [5]

Outcome: Students will be able to understand electrical and electronic measuring devices and instrumentation like bridges, transducers, CRO etc.

Text Books:

1. Albert D. Helfrick, Wiliam D. Cooper, "Modern Electronic Instrumentation and Measurement Techniques", PHI Learning Private Limited, 2011.

3. A.J. Bouwens, 'Digital Instrumentation', McGraw Hil, 2nd Edition, 2002.
4. E.O. Doebelin, 'Measurement Systems – Application and Design', McGraw Hill publishing company, 3rd Edition, 2007.

EC-14.203 **Digital Electronics** **Total Lectures: 40**

3-1-0-4

Objective: The aim of this course is to present the principles and techniques of combinational and sequential digital logic design and optimization at a gate level. The use of transistors for building gates is also introduced.

Pre-requisite: Basic Electronics

1. **Number Systems and Codes:** Introduction to number systems, weighted and non-weighted codes, 1's complement, 2's complement, complement arithmetic. [2]
2. **Introduction to Boolean Algebra:** Postulates and theorems of Boolean algebra, Boolean functions, canonical and standard form, simplification of Boolean function using Boolean laws and theorems. [2]
3. **Logic Gates:** Diode and transistor as a switch, basic logic gates, derived logic gates, block diagrams and truth tables, logic diagrams from Boolean expression and vice versa, converting logic diagram to universal logic, positive logic, negative logic and mixed logic. [5]
4. **Simplification of Boolean Functions:** K-map representation, incompletely specified functions, simplification realization with gates, Quine-McCluskey method. [5]
5. **Combinational Logic:** Analysis and design of combinational circuits, half adder and full adder, half subtractor and full subtractor, binary serial and parallel adder, BCD adder, binary multipliers, magnitude comparator, decoders, encoders, multiplexers, de-multiplexers. [10]
6. **Sequential Circuits:** Latches, flip-flops, triggering of the flip-flops, master-slave flip-flop, excitation tables, conversion of the flip-flops, analysis and design of clocked sequential circuits, shift registers, counters. [10]
7. **Logic Families:** Logic gate characteristics (propagation delay, speed, noise margin, fan-in, fan-out, power dissipation), standard logic families (RTL, DCTL, TTL, ECL, MOS) [5]
8. **Programmable Logic:** Introduction to programmable logic array (PLA), programmable array logic (PAL). [1]

Outcome: Graduates will have knowledge of digital systems. They will understand how to analyze and design digital logic circuits, and be familiar with digital ICs.

Text Books:

3. Tocci, R. J., Widmer, N. and Moss, G., "Digital System: Principles and Applications", Pearson Education, Patparganj, Delhi, 10th Edition, 2007.

EC-14.208 **Principles of Electromagnetics** **Total Lectures: 40**

3-0-0-3

Objective: To develop the understanding of basics concepts of electromagnetic field theory and its applications.

Pre-requisite: Basic understanding of laws of Physics and Mathematics

1. **Introduction**: Transformation of a point and a vector in different coordinate systems, Differential length, area, volume Physical meaning of gradient, divergence and curl, Laplacian of a scalar, Divergence theorem, Stoke's theorem, review of electrostatic and magneto static fields. [8]
2. **Time Varying Fields and Maxwell's Equations:** Faraday's law of electromagnetic induction, Maxwell's equations in integral and differential form, potential functions, electromagnetic boundary conditions. [8]
3. **Electromagnetic Waves:** Introduction, Helmholtz wave equation, Wave equations and their solutions for free space, lossy dielectric, Lossless dielectrics and good conductor medium, Poynting vector and the flow of power. Reflection of plane wave at dielectric media and conducting surfaces for normal incidence. [10]
4. **Transmission lines:** Types of transmission lines, transmission line parameters, two conductor transmission line equations, input impedance, standing wave ratio and power of transmission lines, smith chart, transmission line impedance matching techniques. [6]
5. **Guiding Structures:** General wave behaviors along uniform guiding structure, rectangular and circular wave guides, wave propagation in rectangular and cylindrical cavity resonators. [8]

Outcome: After completion of this course, students would be understanding the concept of electric and magnetic fields, both static and dynamic, and gain insight in various application areas like transmission lines and waveguides.

Text Books:

CS-14.225 **C++ Programming Laboratory**

EE-14.224 **Electrical Machines-II Laboratory**

0-0-2-1

Objective: The objective of the Electrical Machines-II Lab is to provide an exposure of operation of different types of A.C. motor and ac generator and give them experimental skill. It also aims to understand the generation of A.C. voltages by synchronous generator and induction generator and study their performance. It also enables the students to understand their testing, load characteristics and methods of speed control.

Pre-requisite: Electrical Machines

1. To perform load test on three-phase Squirrel cage Induction Motor.
2. To conduct no-load test and blocked rotor test on three-phse Squirrel cage Induction motor and to draw the circle diagram.
3. To obtain the equivalent circuit of a single-phase induction motor by no-load test and blocked rotor test.
4. To determine the regulation of a three-phase alternator at full load condition by ZPF method.
5. To determine the regulation of a three-phase alternator at full load condition by ASA method.
6. To conduct load test on single phase induction motor and to draw the performance characteristics.
7. To determine the regulation of a three-phase alternator by EMF and MMF method.
8. To conduct the parallel operation/synchronization of an alternator with bus bar by Synchroscope.
9. To perform the starting of Induction motor automatically by Start-delta starter.
10. To plot V and inverted V-curves of three phase synchronous motor.
11. To conduct the experiment for separation of no-load losses of three-phase induction motor.

Outcome: Students will be convergent with transformer and d.c. machines and their testing and performance aspects.

Text Books:

1. J.B. Gupta, "Theory and Performance of Electrical Machines", S. K. Kataria, 4th Edition, 2005.

Reference Books:

1. P.S. Bimbhra, "Electrical Machinery", Khanna Publisher, New Delhi, 3rd Edition, 2003.

0-0-2-1

Objective: The objective of this lab is to provide students with an understanding of the fundamental concepts in object oriented programming and to provide the skills needed for developing the software application.

Pre-requisite: CS-14.101,CS-14.111

Write C++ Programs to illustrate the concept of the following:

1. Class and Objects
2. Arrays and Array of objects
3. Scope resolution operator and Memory management operators
4. Friend functions
5. Function overloading and operator overloading
6. Constructors and Destructors
7. Inheritance
8. Polymorphism and Virtual Functions
9. this Pointer
10. Exception handing
11. File I/O Operations
12. Templates- function and class templates

Outcome: Upon the completion of the course students have knowledge of the underlying the static member, friend function, operator overloading, exception handling, inheritance and polymorphism in object oriented programming application.

Text Books:

1. Herbert Schildt, "C++: The Complete Reference", McGraw Hill, 4th edition, 1994.
2. Robert Lafore, "Object-Oriented Programming in C++", SAMS, 4th edition, 2001.

Reference Books:

1. Bjarne Stroustrup,"Programming-Principles and Practice Using C++", Addison-Wesley, 2nd Edition, 2014.
2. E. Balagurusamy, "Object Oriented Programming With C++", McGraw Hill, 4th edition, 2008.

EE-14.210 **Comprehensive-I**

0-0-0-3

Objective: This course provides the:

1. The fundamental principles in electric circuit theory and to be able to extend these principles into a way of thinking for problem solving in mathematics, science, and engineering.
2. To expose the students to the concepts of various types of electrical machines and applications of electrical machines.
3. Build a foundation of basic knowledge required for electrical power engineers.
4. Understand the sources of energy and their contributions to the energy and power needs of the nation and the world.

Pre-requisites: Network Analysis, Electrical Machine-I, Electrical Machine-II, Power Plant Engineering, Electrical Measurement & Instrumentation

1 **Network Analysis:** Kirchoff's Laws in the frequency domain and impedance combinations, Nodal and mesh analysis for phasor circuits, Power in the Unbalanced three-phase systems, Application of the Laplace transform to electric circuits and the transfer function

2 **Special Machines:** Tacho-generator, AC and DC servomotor, Linear induction motor, Single phase motor, Double field revolving theory, Capacitor start capacitor run motors, Shaded pole motor, Repulsion type motor, Universal motor, Stepper motor.

3 **Electrical Measurement and Instrumentation:** Instrumentation amplifiers- single differential amplifier and three amplifier configurations, D/A and A/D converters, and concepts of a measurement channel and its components, Data acquisition and distribution configurations, analyze sample and hold circuits and multiplexers, Transducer interfacing techniques, passive and active transducer measurement requirements, Error analysis in the measurement channel, types of errors; consider transducer errors, transducer output linearization, instrumentation amplifier errors, filter errors, A/D converter errors, sample and hold and multiplexer errors.

4 **Power Generation System:** Steam power plant generation cycles, Nuclear Power Generation Safety considerations in the nuclear industry. Developments in nuclear fusion. Decommissioning problems of nuclear sites. Nuclear waste disposal systems, Fuel Cells-Definition and principles of operation. Losses and efficiency. Possible fuels. Fuel-cell technologies and applications, Combined Heat and Power (CHP) schemes, Application of CHP systems for the provision of heating, cooling and electric power. Selection criteria of CHP prime-movers.

Outcome: Upon completion of this course, the students should be able to:

1. Use network techniques, to analysis large circuits.
2. Understand constructional details, principle of operation of Special Machines.

Text Books:

1. I.J Nagrath, "Electric Machines", McGraw hill Edition.4th Ed. 2010.
2. F. F. Kuo "Network Analysis & Synthesis", John Wiley & Sons, 2nd Ed., 1999.

Reference Books:

1. M. G Say, "Alternating Current Machines", ELBS & Piman, London, 2nd Ed 1984.
2. D Roy Choudhury., "Networks and Systems", New Age International Publishers, 2nd Ed 2010.
3. A K Sawhney, "A course in Electrical & Electronic Measurements & Instruments", Dhanpat rai, 3rd Edition, 2005.

EE-14.301 **Transmission & Distribution** **Total Lectures: 40**

3-1-0-4

Objective:
1. To learn the fundamentals of power system for designing a system that meets specific need.
2. To understand the factors affecting Insulators and also in Under Ground cables.
3. To calculate the various parameters in Distribution System.

Pre-requisite: Network Analysis& Synthesis

1. **Introduction:** Structure of a power system, Effect of Transmission voltage, Load factor, diversity factor, plant capacity factor, plant utilization factor, different types of tariffs, per unit quantities and its advantages, Impedance and Reactance Diagram. [5]

2. **Transmission Line Parameter:** Configuration, Type of conductors, Resistance of line, Skin & Proximity Effects, Calculation of Inductance and capacitance of single phase, three phase, Single circuit and double circuit transmission lines. [7]

3. **Performance of Transmission Lines:** Representation of short, medium and long transmission lines, Ferranti effect, SIL, Tuned Power Line, Power flow through transmission lines. [6]

4. **Insulator and Corona:** Overhead lines insulators type of insulators and their applications Potential distribution over a string of insulators, Methods of Equalizing the potential, Phenomenon of Corona, Corona Loss, Factors affecting Corona, Methods of reducing corona. [6]

5. **Mechanical Design of Transmission Lines:** Catenary curve, Calculation of sag and Tension, Effects of wind and ice Loadings, Sag Templates, Vibration dampers. [5]

6. **Underground Cables:** Types of Insulation for Cable, Sheath, Armour and Covering, Classification of cables, Effective Conductor Resistance, Inductive Reactance, Capacitance of single phase and three phase cables, Grading of Cables, Problems with Underground cables. [5]

7. **Distribution:** Comparison of various Distribution systems, type of Primary Distribution systems and Secondary Distribution systems, Choice of transmission voltage, Kelvin's law, Limitation of Kelvin's law. Necessity of neutral grounding, various methods of neutral grounding. [6]

Outcome: At the end of this course the student is expected to have understood the following:
- Basic principles of supply systems.
- Mechanical & electrical design of overhead lines.
- Performance of transmission lines.

Text Books:
1. Wadhwa C.L. "Electrical Power Systems Electronics", New Age International Publishers, 4th Edition, 2011.
2. Gupta, B.R., "Power System Analysis and Design" S.Chand and Co., Ltd, 2nd Edition, 2005.

Reference Books:
1. Grainger, J.J. and William D. Stevenson Jr., "Power System Analysis", McGraw Hill, 3rd Edition,2005.
2. AbhijitChakrabarti, SunitaHalder "Power System Analysis: Operation and Control", Prentice Hall of India, 2nd Edition, 2008.

EE-14.303 **Control Systems Engineering** **Total Lectures: 40**

3-1-0-4

Objective: The student gains the knowledge of the fundamental principles of analog and digital control system engineering, time response and frequency response analysis with its practical implementation. This course helps in understanding the design of Compensator and PID controller for the Automatic control of Industry.

Pre-requisite: Mathematics, Network Analysis& Synthesis

1. **Introduction:** Introduction to control systems, digital control system, types of control systems and their examples, mathematical modeling of electrical and mechanical systems (f-v and f-i analogy). [8]

2. **Reduction Techniques:** Block diagram reduction and signal flow graph representation of systems. [6]

3. **Domain Analysis:** Introduction, correlation between Transient response and frequency response, standard input signals, Response of 1st and 2nd order systems, time domain specifications i.e. rise time, peak time, delay time, peak overshoot, settling time steady state error etc., different types of feedback systems, Steady state errors for unit step, unit ramp and unit parabolic inputs, controller components. [10]

4. **Stability:**Introduction, concept of stability, conditions for stable system, asymptotic, relative and marginal stability, Routh-Hurwitz criterion for stability. [4]

5. **Plotting Techniques:** Root locus techniques, Bode plots, polar plots Nyquist criterion and Nichol's chart. [8]

6. **State Variables:** Analysis of systems, state vector, state space, advantages of state space techniques, state space representation, State variable analysis and design. [4]

Outcome: After completion of the course,

- The student will be able to get acquainted of analog and digital control system.
- The student will analyze and to design and development of automatic controller for industrial application.
- The student will gain the knowledge of stability analysis and improvement of stability for control system.
- This course becomes very beneficial for the graduates who wish to work in core sectr industry as most of the core sector is state-of-art control.
- This course becomes very beneficial for the 4th year student who will choose elective paper in Digital control system and other control system elective.

Text Books:

1. K. Ogata, "Modern Control Engineering," Pearson Education/Prentice Hall of India, 4th Edition, 2003.
2. I.J. Nagrath and M. Gopal, "Control System Engineering," New Age International Publishers, 2nd Edition, 2003.

Reference Books:

1. Syed HasanSaeed, "Automatic Control Systems (with MATLAB Programs)," S.K. Kataria& Sons Publishers, 6th edition, 2008.
2. SamarjitGhosh, "Control Systems: Theory and Applications," Pearson Education, 2nd Edition, 2012.
3. M.N. Bandyopadhyay, "Control Engineering Theory and Practice," Prentice Hall of India, 2nd Edition, 2003.

EC-14.307 **Fundamentals of Signal Processing** **Total Lectures: 40**

3-1-0-4

Objective: This course aims to provide the students with a basic understanding of the fundamental characteristics of signals and systems. It equips the students in understanding signals and systems in terms of the time and transforms domains, convolution, filtering, modulation and sampling. It introduces the mathematical approach to manipulate discrete time signals, which are useful to design and analyze filters.

Pre-requisite: Engineering Mathematics, Network analysis

1 **Introduction to Digital Signal Processing**: Introduction , Discrete time signals & systems, linear shift invariant systems, stability and causality, Linear-constant coefficient difference equations, Frequency domain representation of discrete time signals and systems, properties of the Discrete Time Fourier transform (DTFT), Sampling and discrete time processing of continuous-time signals. [10]

2 **Z Transform**: Applications of z-transforms, solution of difference equations of digital filters, System function, stability criterion, and frequency response of stable systems, one sided Z-transform and its applications. [8]

3 **Discrete Fourier series:** Properties of discrete Fourier series, DFS representation of periodic sequences. Discrete Fourier Transforms, Properties of DFT, Fast Fourier Transforms (FFT) Radix-2 decimation in time and decimation in frequency FFT Algorithms, Inverse FFT. [8]

4 **IIR Digital Filters:** Analog filter approximations - Butterworth and Chebyshev, Design of IIR Digital filters from analog filters, Bilinear transformation method, step & impulse invariance techniques, Realization of IIR digital filters. [7]

5 **FIR Digital Filters:** Characteristics of FIR Digital Filters frequency response, Design of FIR Digital Filters using Window Techniques. Comparison of IIR and FIR filters, Realization of FIR digital filters. [7]

Outcome: Upon completion of the course the student will be able to

- Analyze the spectral characteristics of continuous-time periodic and a periodic signals using Fourier analysis.
- Analyze discrete-time signals and systems using DFT and FFT.
- Apply the Laplace transform and Z- transform for analyze of continuous-time and discrete-time signals and systems
- Design and implement digital finite impulse response (FIR) filters.
- Design and implement digital infinite impulse response (IIR) filters.

Text Books:

1. Oppenheim & Schaffer, “Digital Signal Processing”, PHI, 3rd Edition, 2010.
2. Proakis John G., “Digital Signal Processing: Principles, Algorithms and Applications”, Pearson education, 3rd Edition, 2006.

Reference Books:

1. Oppenheim A.V. & Schafer R.W., "Discrete Time Signal processing", Pearson Education, 2nd Edition, 2009.
2. Haykin S and Van Veen B, “Signals and Systems, Wiley, 2nd Edition, 2000.

CS-14.202 **Java Programming** **Total Lectures: 40**

3-0-0-3

Objectives: The objective of this course is to:

- Cover issues related to the definition, creation and usage of classes, objects and methods. Become comfortable with object-oriented programming and learn to think in terms of objects.
- Discuss the principles of inheritance and polymorphism. The concepts would be demonstrated through problem analysis assignments.
- Provide the foundation of good programming skills by discussing key issues of the design of object-oriented software, including programming design patterns and documentation.
- Cover the basics of APIs as well as allow students to explore the Java Abstract Programming Interface.

Prerequisites: Programming languageC, C++, Data Structures

1. **Overview:** Introductionto java, importance of Java, interactive development environments: Eclipse/Net Beans, basics of OOP. [4]
2. **Data Types, Variable and Arrays:** primitive data types, type casting,arrays, operators and control structures. Identifiers, constants and literals. [6]
3. **Classes and Objects:** Class fundamentals, declaring objects, assigning object referencevariables, introducing methods, constructors, the this keyword, garbage collection, the finalize() method, overloading methods, using objects as parameters and return type, introducing access control, understanding static, introducing final, introducing nested and inner classes, exploring the string class, using command-line arguments. [9]
4. **Inheritance:** Inheritance basics, using super, multilevel hierarchy, constructor in hierarchy, method overriding, dynamic method dispatch, using abstract classes, using final in inheritance, the object class. [4]
5. **Package, Interfaces and Exception Handling:** Packages, access protection, importing packages, interfaces, exception-handling fundamentals, exception types, using try and catch, multiple catch clauses, nested try statements, throw, throws, finally, Java's built-in exceptions, user defined exception. [6]
6. **Multithreaded Programming:** The Java thread models, the main thread, creating multiple threads, thread priorities, managing threads, Thread class built-in function. [4]
7. **I/O and String Handling:** I/O basics, reading console input, writingconsole output, the Print Writer class, reading and writing files, string constructors, operations on String, String tokenizing, String Buffer. [7]

Outcomes: Upon completion of this course, students are able to:

- Understand the concepts of OOP and usage principles of inheritance, polymorphism, encapsulation and method overloading.
- Identify classes, objects, members of a class and the relationships among them needed for a specific problem.
- Develop programs using the in-built Java API and the Java standard class library.
- Use of development environment like Eclipse for collaborative programming/editing.

Text Books:

1. Herbert Schildt, Java the Complete Reference,McGraw-Hill Osborne, 8th edition, 2011.
2. John Jukowski,Mastering Java 2, Wiley, 2ndEdition, 2002.

Reference Books:

1. Allen B. Downey, Think Java: How to Think Like a Computer Scientist,CreateSpace Independent Publishing Platform, 3rdEdition, 2009.
2. PaulDeitel,Harvey Deitel, Java How To Program (Early Objects), Prentice Hall, 10th Edition, 2014.

EE-14.321 **Control Systems Laboratory**

0-0-2-1

Objective: This laboratory course facilitates the students to get a comprehensive exposure to various techniques /principles and applications of control systems for real life implementation like temperature control of oven, position control of DC/AC servomotor, synchro devices as a control transformer, robotic control systems etc.

Prerequisites: Nil

1. To study the performance of various types of controllers (P, PI, PID) in order to control the temperature of an oven.
2. To study the performance analysis of PC based analogue and digital motor control system (DCMC) with second order feedback system behavior.
3. To study the characteristics of a Synchro Transmitter Receiver pair and use these as torque-synchro and angular error detector.
4. To study the performance characteristics of angular position error detector (AC&DC excitation) using two Potentiometers.
5. Using Nyquist Stability technique, find the stability of negative feedback control system whose open loop transfer function is given by $G(s)\,H(s) = 10/[(s+1)(s+2)(s+3)]$ Also verifies the MATLAB results/stability with theoretical method after plotting on graph sheets.
6. To study the performance characteristics of an AC servo motor angular position control system and analysis of transient characteristics with gain Variation.
7. To study the performance characteristics of a DC servo motor angular position control system and analysis of transient characteristics with gain Variation and additional tachometer feedback.
8. To study the Characteristics of an A.C. Servo Motor and determine its transfer function.
9. Plot the Root locus diagram for investigating the stability for the system whose open loop transfer function given by $G(s)\,H(s) = K/[s(s+4)(S+5)]$. Using MATLAB Code, verify the results with Conventional method.
10. To study and design the pc based universal robotic system as snake.
11. Draw the bode plot for the transfer function $G(s) = 50/[s(1+0.25s)(1+0.1s)]$.
    From the graph, determine:
    1. Gain Crossover Frequency
    2. Phase Crossover Frequency
    3. Gain Margin
    4. Phase Margin
    5. Stability of the system

    Also, verify the MATLAB results with theoretical value.
12. Obtain the state space, pole-zero and residue pole form of the control system whose transfer function is given by.

Outcome: The students shall develop an insightful knowledge on various techniques and concepts of analysis & design of control system for different applications like temperature control of oven, position control of DC/AC servomotor, synchro devices, Robotic control systems etc.

Text Books:

CS-14.222 **Java Programming Lab**

0-0-2-1

Objectives: The objective of this course is to:

- Become comfortable with object-oriented programming and learn to think in terms of objects.
- Provide the foundation of good programming skills by discussing key issues to the design of object-oriented software, including programming design patterns, documentation.

Pre-requisites: Object Oriented Programming (C++) Concepts

Assignments/ List of Programmes:

1. Basic programmes illustrating data types, control structures etc.

2. Programs illustrating: Methods and Class, Constructors, Overloading Methods, Static Data and Methods, Final Keyword and Command Line Arguments

3. Programs using Inheritance, Super Keyword, Over-riding, abstract Classes, Final in Inheritance

4. Programs using Packages and Interfaces.

5. Programs Using Exception Handling.

6. Programs for creating and managing multiple threads.

7. Programs illustrating Input/output Operations

Outcomes: Upon completion of this course, students are able to:

- Understand the concepts of OOP as well as the purpose and usage principles of inheritance, polymorphism, encapsulation and method overloading.
- Create Java application programs.
- Use of development environment like Eclipse for collaborative programming/editing.

Text Books:

1. Allen B. Downey, Think Java: How to Think Like a Computer Scientist, 4th Edition, 2011.
2. Paul Deitel, Harvey Deitel, Java How To Program (Early Objects), 10th Edition, 2014.

GE 303 **Interpersonal Communication** **Total Lectures: 30**
0-0-2-1

Objectives: To provide the training for improving communication and interpersonal skills

Pre-requisites: Nil

1. **Reading Comprehension**: To develop skills such as comprehending the text, composition, skimming and scanning. [12]
2. **Idioms and Phrasal Verbs:** Understanding idioms, Introduction to Phrasal verbs, verb and preposition/adverb combination, usage of idioms and phrasal verbs. [2]
3. **Report Writing**: Defining the purpose and the scope of a report, Structure of a report, and the process of writing a report. [4]
4. **Phonetics**: Introduction to international phonetic alphabet, speech organs and sound symbols, transcription of words, stress and syllable. [6]
5. **Paragraph writing**: Introduction to different types of writing and development of writing skills through exercises. [3]
6. **Composition skills**: Resume writing and composing an email. [3]

Outcome: Upon completion of this course, students are able to improve communication and interpersonal skills

Text Books:

1. Tongue R.K, Kumar S.K, An English Miscellany, Oxford University Press, New Delhi, 4th Edition, 2001

Reference Books:

1. Rutherford A, Basic Communication Skills for Technology, Pearson Education, 2nd edition, 2002.
2. Sharma R.C. Krishna M, Business Correspondence and Report Writing, McGraw Hill, 2nd edition, 1999.
3. Bhatnagar R.P., English for Competitive Examination, Macmillan India Limited, 5th edition, 1998,.

CS-14.313 **Computer Networks** **Total Lectures: 40**
3-0-0-3

Objective(s):

1. To give basic concepts of network models&understandof different encoding techniques, physical, data link &explain how data communication takes place.
2. To be able to carry out the analysis of various routing and congestion control Algorithms and their complexity & understand of different MAC layer protocols.
3. To give the basic understanding of error detection and correction and different methodologies for implementing them & understanding of internet application layer protocols.

Prerequisite(s): Programming languageC, C++, Data Structures

1. **Overview and Network Model:** Network topologies, protocols and standards, basic elements of a network, OSI reference model, TCP/IP model, categories of networks- LAN, WAN and MAN. [6]
2. **Physical Layer:** Manchester, differential Manchester encoding, NRZ, multilevel binary and bi-phase encoding, scrambling techniques, packet and circuit switching, transmission media. [6]
3. **Data Link Layer:** Framing, stop and wait protocol, sliding window protocol, performance and efficiency, HDLC, error detection, parity check. [4]
4. **MAC Layer:** Pure and slotted Aloha, throughput characteristics, CSMA/CD, performance. [3]
5. **Local Area Network:** IEEE 802.3, 802.4, 802.5, performance evaluation, FDDI, DQDB. [6]
6. **Network Layer:** Virtual circuits, datagrams, IPv4, IP address classes, super netting, IP fragmentation, ARP, RARP, routing algorithms, congestion control algorithms, leaky bucket, token bucket, ICMP, IPv6. [6]
7. **Transport Layer:** Duties of the transport layer, connection, TCP, TCP services, TCP header, UDP, UDP header. [5]
8. **Application Layer:** Client/Server model, DNS, FTP, HTTP, SMTP, SNMP. [4]

Outcome: Upon completion of this course, students are able to:

- Understand layered architecture, explain and compare Internet protocols&encoding techniques and switched networks.
- Understand framing, flow, error control protocol and medium access control protocol.
- Describe IEEE standards for local area network&datagram, fragmentation, routing and congestion control algorithm.Implement client server program.

Text Books:
1. Tanenbaum A. S., Computer Networks, Prentice-Hall of India, 5th Ed., 2011.
2. Stallings W., Data and Computer Communications, Prentice-Hall of India, 8th Ed., 2010.

Reference Books:
1. Forouzan B. A., Data Communications and Networking, McGraw-Hill, 3rd Ed., 2004.
2. Hayes J. F., Modeling and Analysis of Computer Communication Networks, Khanna Publishers, 1st Edition, 1987.

EE-14.302 **Power System Analysis** **Total Lecture: 40**

3-1-0-4

Objective:
- To know the necessity of load flow in a regulated system.
- To examine the need of various analysis like fault analysis, short circuit analysis stability analysis, steady state and transient analysis.

Prerequisite: Transmission & distribution

1. **Load Flow Studies:** Bus admittance(Y bus) and Impedance (Z bus) matrices and their formation. Power flow in a transmission system, bus classification, Load flow equations and solution techniques-Gauss iterative method, Gauss-Seidel method, Newton-Raphson method, comparison of load flow solution techniques. [9]
2. **Fault Calculation and Network:** Symmetrical fault, Significance of Positive, Negative and Zero Sequence Components, Fault calculation, Sequence Networks, Unsymmetrical fault analysis – Single Line to Ground faults, Line to Line fault, Double line to Ground fault. [9]
3. **Power System Stability:** Steady state stability and transient stability- stability problem, rotor dynamics and swing equation, power angle equation and diagram, equal area criterion and its application, critical clearing angle, fault clearing time, factors influencing transient stability, methods of improving stability. [8]
4. **Economic Load Dispatch:** Station performance and operating characteristics, Incremental rate theory, optimal Load distribution within generating station and between various generating stations in a region, Transmission loss equation, Calculation of losses and Generation scheduling and dispatch. [8]
5. **Power System Control:** Load Frequency control:Load Frequency Problems, Speed Governing System, Reasons for Limits on Frequency. Excitation systems, Automatic Voltage Regulators, SCADA and Computer control. [6]

Outcome:
- Apply the load flow application to various power system problems like minimization of transmission line losses, minimization of the total fuel cost etc.,
- Analyze the economic dispatch problem in thermal power plant
- Design a power system solution based on the problem requirements and realistic constraint.

Text Books:
1. Grainger,J.J. and William D. Stevenson Jr., "Power System Analysis", McGraw Hill, 4th Edition,2005.
2. Wadhwa.C.L. "Electrical Power Systems Electronics", New Age International Publishers, 3rd Edition, 2011.

Reference Books:
1. Ashfaq Husain "Electrical Power Systems", CBS Publishers and Distributors, 4th Edition, 1996.
2. AbhijitChakrabarti, SunitaHalder "Power System Analysis: Operation and Control", Prentice Hall of India, 2nd Edition, 2008.

EE-14.304 **Power Electronics** **Total Lectures: 40**

3-0-0-3

Objective:

- To introduce to students the theory and applications of power electronics systems for high efficiency, renewable and energy saving conversion systems
- To prepare students to know the characteristics of different power electronics switches, drivers and selection of components for different applications
- To develop students with an understanding of the switching behavior and design of power electronics circuits such as DC/DC, AC/DC, DC/AC and AC/AC converters

Prerequisite: Network Analysis and Synthesis, Basics of Electronics Engineering, Engineering Mathematics

1. **Introduction:** Review of power semiconductor devices, SCR, Static and dynamic characteristics, Turn-on and Turn-off methods and circuits, Ratings and protection of SCRs, Series and parallel operation of thyristor, Other members of thyristor family. [8]
2. **Phase Controlled Converters:** Principle of phase control, Single phase half wave circuit with different types of loads, Single phase and three phase semi converter and full converter bridge circuits, Single phase dual converters and their operation with circulating and non-circulating currents. [10]
3. **AC Voltage Controllers:** Types of single-phase voltage controllers, Singlephase voltage controller with R and RL type of loads, gate pulse requirements to trigger the SCRs of ac voltage controllers. [5]
4. **Cycloconverters:** Principles of operation, Single phase to single phase step up and step down cycloconverters. Three phase to single phase cycloconverter. [5]
5. **DC Choppers:** Principle of chopper operation, Control strategies, Types of choppers, Step up and step down choppers, Types of choppers and operations. [5]
6. **Inverters:** Single phase VSI: half bridge and full bridge inverters, three phase bridge inverters with 180 degree and 120 degree modes of operation, Series and parallel inverters, Introduction to current source inverters. [7]

Outcome:

- The student will be able to understand the principle of operation of commonly employed powerelectronic converters
- The student will be capable of analyzing non-linear circuits with several power electronic switches
- The student will be equipped to take up advanced courses in Power Electronics and its application areas

Text Books:

1. Rashid, M., Power Electronics, Prentice Hall of India Private Limited, 4th Edition,2006.
2. P.S. Bimbhra, Power Electronics, Khanna publishers, 5th edition, 2012.

EC-14.212 **Communication Engineering** **Total Lectures: 40**
3-0-0-3

Prerequisite: Engineering Mathematics, Electronics Devices and Circuits

Objective: To equip students with various issues related to analog and digital communication such as modulation, Demodulation, Noise handling, Data conversion and Multiplexing.

1. **Introduction:** Model of a communication system, analog and digital signal, Signal bandwidth, noise calculation, noise figure, noise temperature. [6]
2. **Linear Modulation & Demodulation Techniques:** Need of modulation, Frequency translation, amplitude modulation, double side band, double side band suppressed carrier, single side band, vestigial side band, bandwidth, and power efficiency consideration of different linear modulations, time domain and frequency domain analysis of different modulation schemes and different types of demodulation techniques. [10]
3. **Angular Modulation & Demodulation Techniques:** Frequency modulation, phase modulation, bandwidth consideration of these modulations, narrow band and wide band frequency modulation, commercial broadcasting systems and different types of demodulation techniques. [8]
4. **Digital Communication Techniques:** Advantages of digital communication over analog communication, Shannon capacity, sampling theorem and techniques, quantization techniques, PCM, DPCM, DM. Digital modulation and demodulation techniques ASK, FSK, PSK, bandwidth consideration of different digital modulation schemes. [10]
5. **Advanced Communication Techniques:** Optical fiber communication, microwave communication, wireless communication, GSM, FDM, TDM, CDMA. [6]

Outcome:

- Students will develop the basic understanding signals and the means of their transmission.
- Students will be familiar with the need of modulation and advantages and disadvantages of different modulation schemes.
- Students will have knowledge of advance communication techniques and emerging new technologies in the field of communication.

Text Books:

1. B. P. Lathi, Modern Digital and Analog communication Systems, Oxford University Press, 3rd Edition, 2010.
2. Kennedy and Davis, Electronic Communication Systems, McGraw Hill, 4th Edition, 2012.

2. Taub& schilling, Principles of communication Engineering, McGraw Hill, 4th Edition, 2009.

EC-14.202 Microprocessor Programming and Interfacing Total Lectures: 40
3-0-0-3

Objective: To develop an in-depth understanding of the operation of microprocessors and microcontrollers, machine language programming & interfacing techniques.

Pre-requisite: Analog and Digital Circuits

1. **The Microcomputer:** Evolution ofmicroprocessor, address bus and data bus, introduction to machine language and assembly language, logic devices for interfacing: 74244, 74245, 74373. [3]
2. **The 8085 Processor:** Architecture, pin diagram and description of various signals, read, write and op-code fetch cycles, interrupt structure, instruction set and Assembly language programming. [12]
3. **The 8086 Microprocessor Architecture:** Architecture, details of sub-blocks such as EU, BIU; memory segmentation and physical address computations, pin diagram and description of various signals, minimum and maximum mode of operations, supporting chips viz. 8284, 8288 and memory mapping. [8]
4. **Programming of 8086:** Addressing modes of 8086, instruction set of 8086, assembly language programming, counters and time delays, stack structure of 8086 and subroutine. [7]
5. **Interfacing of 8085/8086 with Programmable Chips:** Interfacing of 8255 Programmable peripheral interface, 8251 USART, 8253/8254 Programmable Interval Timer and Direct Memory Access Controller 8237/8257 DMA, 8259 Programmable Interrupt Controller. [10]

Outcome: Upon completion of this course, the student will be able to:

- The student will learn the internal organization of some popular microprocessors and microcontrollers.
- The student will learn hardware and software interaction and integration.
- The students will learn the design of microprocessors/microcontrollers-based systems.

Text Books:

1. Ramesh S. Gaonkar, Microprocessor Architecture, Programming and Application with the 8085; Penram International Publishing (India), 5th edition, 2006
2. A. K. Ray & K. M. Bhurchandi, Advanced Microprocessors and Peripherals, McGraw Hill, 4th Edition, 2012

Reference Books:

1. D. V. Hall, Microprocessors and Interfacings; McGraw Hill, 2nd Edition, 2008.
2. B. P. Singh and RenuSingh, Advanced Microprocessors and Microcontrollers, New Age International Publishers, 3rdEdition, 2012.

EE-14.322 **Basic Electrical Simulation Laboratory**

0-0-2-1

Objective: The objective of Basic Electrical Simulation laboratory is to make the students aware about the use and applications of simulating software. The course will impart hands on experience in verification of circuit laws and theorems, measurement of circuit parameters, study of circuit characteristics using MATLAB & ETAP. It also gives practical exposure to the usage of different power circuits with different condition.

Pre-requisite: Basic electrical engineering and basic power system fundamentals

1. Basic MATLAB desktop, help Browser, types of files, basic commands.
2. Introduction to SIMULINK, creating and simulating a SIMULINK model.
3. Plotting of single phase and three phase voltage waveforms using MATLAB through programming techniques.
4. Simulink model to generate sine and cosine waveforms.
5. Response of RL circuit and transient study using MATLAB.
6. Response of RC circuit and transient study using MATLAB.
7. Response of RLC circuit and transient study using MATLAB.
8. To plot the daily load curve for the given data using MATLAB.
9. Introduction to basics of Electrical Transients Analyzer Program (ETAP).
10. Study and operation of various ETAP modules Viz. load flow, short circuit and harmonics.
11. Construction of single line diagram of a power system using ETAP Software.
12. Modeling of power distribution network using ETAP Software.
13. Load Flow analysis using ETAP Software.

Outcome: Upon completion of this course, the student will be able to:

- Develop computer programs for basic electrical circuits.
- Develop computer models for power system components.
- Design, simulate and analyze circuits using simulation packages.

Text Books:

1. Nagrath I. J. & Kothari D. P., Modern Power System Analysis, McGraw Hill Publication Company Ltd, 2nd edition, 2002.
2. Jain Shailendra, Modeling and Simulation using MATLAB Simulink, Wiley India & sons, 5th Edition, 2011.

Reference Books:

1. Pai M. A Computer Techniques in Power Systems Analysis, McGraw Hill Publication Company Ltd, 3rd Edition, 2003.
2. Kusic G. L, Computer Aided Power Systems Analysis, CRC Press, 2nd Edition, 2008.

EE-14.324 **Power Electronics Laboratory**

0-0-2-1

Objective: To enable the students to develop hands on experience in analyzing, designing and carrying out experiments on various electrical networks by make use of power electronic components. It aims to familiarize the switching devices, power converters and its applications in various systems for power control.

Pre-requisite: Network Analysis and Synthesis, Basics of Electronics Engineering, Engineering Mathematics

1. To obtain the V-I characteristic of an SCR and to find out it's latching and holding currents.
2. To obtain the Drain and Transfer Characteristic of a MOSFET.
3. To obtain the V-I characteristic of TRIAC.
4. Study of SCR (i) Resistor Triggering circuit (ii) Resistor Capacitor Triggering circuit for Half wave rectifier.
5. Study of SCR (i) Resistor Triggering circuit (ii) Resistor Capacitor Triggering circuit for Full wave rectifier.
6. Study of Step-Up Chopper with (i) resistive load (ii) resistive, inductive load.
7. Study of Step Down Chopper with (i) resistive load and (ii) resistive – inductive load.
8. To study the forced commutation process of an SCR.
9. Study of Single Phase Bridge Inverter with
   i. Resistive-Capacitive load
   ii. Inductive-Capacitive load
   iii. Resistive Capacitive and Inductive load.
10. To write and execute a program (i.e. STL and Ladder Logic) for SIEMEN make P.L.C to flash a light at regular intervals of time.
11. To simulate a program for a PLC controller to control the traffic lights using 'BRYTONIC' software.
12. To design and develop a simulation schematic for the performance analysis of Half wave rectifier with different loads, using MATLAB SIMULINK toolbox.
13. To design and develop a simulation schematic for the performance analysis of Full wave rectifier with different loads, using MATLAB SIMULINK toolbox.

Outcome:

- Understand the characteristics of various switching devices and appreciate its applications in various electrical networks/systems.
- Analyze and design the operation of power switching converters.
- Develop practical control circuits for various real time applications.
- Analyze and prepare the technical report on the experiments carried out.

Text Books:

1. Muhammad H. Rashid, Power Electronics Handbook, Academic Press, 4th Edition, 2010.
2. Power Electronics Laboratory: Theory, Practice & Organization, (Narosa Series in Power and Energy Systems) Alpha Science International Ltd, July 2006.

Reference Books:

1. Muhammad H. Rashid, Power Electronics, Prentice Hall of India Private Limited, 3rd Edition, 2006.

EC-14.222 Microprocessors Programming and Interfacing Laboratory

0-0-2-1

Objective: To introduce to students the basics of 8086 microprocessor, assembling language programming and interfacing with various modules.

Pre-requisite: In this laboratory the students are expected to learn to apply their theoretical knowledge of both the hardware and software aspects of microprocessors. Programming of the device is done in assembly language. Some of the experiments that follow the construction project deal with software while others deal with the problems of interfacing of microprocessors.

1 [a] Write a program for 8085 microprocessor to move a eight bit number in register A, B, C and D. Verify the content of all the registers after execution of program.
Also find out the followings:
(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

[b] Load an eight bit number stored in memory location 4000H into register A. Now load the content of A in B and in memory location 5000H. Verify the contents of A, B and memory location 5000H.
Also find out the followings:
(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

2 Write an assembly language program to add two eight bit numbers stored in memory and store the 8 LSBs and 8 MSBs of sixteen bit result at 2000H and 2001 respectively. Verify the content of flag register after addition.
Also find out the followings:
(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

3 [a] Write a program to perform multiplication of two 8 bit numbers using 8085 microprocessor.
Also find out the followings:
(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

[b] Let two numbers are stored at memory locations 2000H and 2001H. Write a program for 8085 microprocessor to perform following actions:
If 1^{st} number > 2^{nd} number then store 00H at 3000
If 1^{st} number < 2^{nd} number then store FFH at 3000
If 1^{st} number = 2^{nd} number then store 99H at 3000
Also find out the followings:
(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

4 [a] Write a program for 8086 microprocessor to transfer a series of five eight bit number stored from memory location 2000:2000 to new memory location 3000: 3000.
Also find out the followings:
(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

[b] Write a program for 8086 microprocessor to transfer a series of five sixteen bit number stored from memory location 2000:2000 to new memory location 3000: 3000.
Also find out the followings:

(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

5 [a] Write an assembly language program for 8086 microprocessor to find out the smallest number from a series of five eight bit numbers and store it at memory location 2000H: 2000H.
Also find out the followings:
(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

[b] Write an assembly language program for 8086 microprocessor to find out the largest number from a series of five eight bit numbers and store it at memory location 2000H: 2000H.
Also find out the followings:
(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

6 Create a look-up table from memory location 2000H: 1000H to store square of numbers from 00 to 09. Write an assembly language program for 8086 microprocessor to find out the square of a number stored at 2000H: 100AH and store the result at 2000H: 100BH.
Also find out the followings:
(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

7 [a] Write a program to arrange the series of four eight bit numbers in ascending order.
Also find out the followings:
(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

[b] Write a program to arrange the series of four eight bit numbers in descending order.
Also find out the followings:
(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

8 Interface three LEDs with 8086 Kit to form traffic light control logic.
Also find out the followings:
(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

9 Interface a buzzer with 8086 microprocessor with the help of relay and write a program to control the ON-OFF sound from the buzzer. Also find out the followings:
(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

10 Interface a DC motor with 8086 microprocessor and write a program to control its operation.
Also find out the followings:
(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

Laboratory Assignment: Assembly and Machine Language Programming, Signal Generators, Interfacing Basic I/O devices like Keypad, LED display, Usage of Timers & USART Peripherals.

Outcome: After the basic knowledge of microprocessor and microcontroller interfacing and their applications, the student will be able to:

- Analyze and apply working of 8086.
- Compare the various interface techniques. Analyze and apply the working of 8255, 8279, 8259, 8251, 8257 ICs and design and develop the programs.
- Learning the Communication Standards.

EC-15.312 **Advanced Radio Access Network (ARAN)** **Total Lectures: 40**

3-0-0-3

Objective To acquire skills on different legacy and advance RAN's Architecture, Design & Optimization along with latest industries concepts on 5G, IOT, Volte, RAN Cloud etc.

Prerequisite Digital Modulation Techniques & Data Transmission, Antenna and Wave Propagation, Basics of Mobile Communication

1. **Introduction to RAN:** Telecom E2E approach, RAN Life Cycle**,** RF basics, Microwave Theory, Propagation Models, Modulation Theory, Antenna Theory. Latest Industry Concepts – 5G, IOT, Volte, RAN Cloud [4]

2. **RAN Overview**: Introduction to Cellular Concepts, Introduction to Power Control, Introduction to Protocol Stacks, GSM, WCDMA, LTE (Overview, Architecture, Air Interface), Generalized Call Flows [12]

3. **RAN Design:** RF Design Overview, Initial Radio Network Design (Link Budget, Radio Network Dimensioning & Nominal Design), Final Radio Network Design, Radio Planning Tools & IBS Introduction, Radio Propagation Model Tuning, LRAN Initial Radio Network Design (Sample Report) [12]

4. **RAN Optimization:** Pre Launch Optimization (Process Overview, Introduction to Drive Testing (Data Collection Methodology, Data Post Processing), Post Launch Optimization, (Process Overview, Introduction to Counters and OSS, KPI Improvement Methodology) [12]

Outcome: After completion of this course, students would be able to understand the industry level ways of working of RAN with different design and optimization techniques. Students will get heads up in terms of upcoming advance technology concepts.

EE-14.305 **Power Plant Engineering** **Total Lectures: 40**

3-0-0-3

Objective: This course facilitates the students to understand the basic functioning of generation and design/economics consideration of various power plants.

Pre-requisite: Electrical Engineering course of First Year.

1 **Introduction:** Energy sources and their availability, Principle types of power plants, Their special features and applications, Present status and future trends. [10]
Economic aspects in power Generation: Terms commonly used in system operation, various factors affecting cost of generation: Load curves, load duration curves, Connected load, maximum load, Peak load, base load and peak load power plants, load factor, Plant capacity factor, Plant use factor, Demand factor, diversity factor, Cost of power plant.

2 **Thermal Power Plant:** General developing trends, Essentials, Plant layout, Coal storage, Preparation, Handling, Feeding and burning, Ash handling, Dust collection, High pressure boilers and steam turbines, Their main components like super heaters, Economizers, Pre-heaters etc., Fuel efficiency/heat balance. [8]

3 **Hydro Electric Power Plants:** Classifications, Plant layout, various components, Types of turbines, Pumped storage, hydro-electric plants, advantages and disadvantages. Environmental aspects for selecting the sites and locations of hydro power stations. [8]

4 **Gas Turbine Power Plants:** Schematic arrangement, advantages and disadvantages of Gas turbine power plant. Open cycle and Closed cycle gas turbine power plant, Combined cycle power plant, Comparison of various power plants. [6]

5 **Nuclear Power Plant:** Nuclear fuels, Nuclear energy, Main components of nuclear power plant, Nuclear reactors types and applications, Radiation shielding, Radioactive and waste disposal safety aspect. [8]

Outcome: The students shall develop an insightful knowledge to apply the basic laws and operating principles in various power plants.

Text Books:

1. Deshpande, M.V., "Power Plant Engineering", McGraw Hill, 4th Edition 2004.
2. Gupta B. R., "Generation of Electrical Energy", S. Chand Publications, 14th Edition, 2011.

Reference Books:

1. Wood A.J. & Wallenberg B.F, "Power Generation and Control", John Wiley & Sons, 2nd Edition, 2012.
2. P.K Nag "Power Plant Engineering", McGraw Hill publications, 2nd Edition, 2008.
3. Arora S.C & Domkundawar S, "A course in Power Plant Engineering", Dhanpat Rai, 2nd Edition, 2002.

EE-14.310 **Reliability of Electrical Power System** **Total Lectures: 40**
3-0-0-3

Objective: This course facilitates the students to get a comprehensive exposure to the concept of probability theory, distribution, network modeling and reliability analysis.

Pre-requisite: Power system analysis, Power system transmission and distribution, Matrices, Probability and Calculus.

1. **Review of Probability Theory:** Element of probability theory Probability Distribution, Random variable, Density and distribution functions. Mathematical expectation. Binominal distribution, Poisson distributions, Normal distribution, Exponential distribution, Weibull distribution.. [8]
2. **Reliability of Engineering Systems**:Component reliability, Hazard models, Reliability of systems with non-repairable components, series, Parallel, Series-Parallel, Parallel-series configurations. Non-series-parallel configurations, minimal tie-set, minimal cut-set and decomposition methods. Power System reliability. [8]
3. **Reliability of Engineering Systems**:Reliability model of a generating unit, State space methods, Combing states, sequential addition method, Load modeling, Cumulative load model, merging of generation and load models, Loss of load probability, Percentage energy loss, Probability and frequency of failure, Operating reserve calculations. [8]
4. **Power Network Reliability:** Weather effect on transmission lines, Common mode failures, Switching after faults, three, state components, Normally open paths, Distribution system reliability. [8]
5. **Composite System Reliability:** Bulk Power supply systems, Effect of varying load, Inter connected systems, correlated and uncorrelated load models, Cost and worth of reliability. [8]

Outcome: The students shall have a thorough understanding of the main principles in power system reliability analysis as well as knowledge of different methods and tools for reliability analysis.

Text Books:

3. J. Endreny, "Reliability Modeling in Electric Power Systems", John Wiley & Sons. 1980
4. Roy Billinton& Ronald, N allan, "Reliability Evaluation of Power Systems", Plenum Press, New York. 1990

Reference Books:

3. Sullivan, R.L., "Power System Planning", Heber Hill, 1987.
4. Patrick O'Connor, Andre Kleyner"Practical Reliability Engineering", Wiley 5th Edition,2012

EE-17.419 **Power System Protection** **Total Lectures: 40**
3-1-0-4

Objective: To provide a broad coverage on all types of protective relays, circuit breakers and its working for practical power system protection system.

Pre-requisite: Electrical Machines & Power Plant Engineering

1 **Introduction to Protection System:** Introduction to protection system and its elements, functions of protective relaying, protective zones, primary and backup protection, desirable qualities of protective relaying, basic terminology. [4]

2 **Operating Principle and Relay Characteristics:** Electromagnetic relays, thermal relay, gas actuated relay. Amplitude and phase comparators, over current relays, directional relays, distance relays, differential relay. [8]

3 **Static Relays:** Comparison with electromagnetic relay, classification and their description, over current relays, directional relay, distance relays, differential relay. [6]

4 **Protection of Transmission Line:** Over current protection, distance protection, pilot wire protection, carrier current protection, protection of bus. [6]

5 **Apparatus Protection:** Protection of Transformer, Generator and Motor. [3]

6 **Circuit Breaking:** Properties of arc, arc extinction theories, re-striking voltage transient, current chopping, Resistance switching, capacitive current interruption, short line interruption, circuit Breaker ratings, [6]

7 **Circuit Breaker:** Operating modes, selection of circuit breakers, ratings of circuit breaker, constructional features and operation of Bulk Oil, Minimum Oil, Air Blast, SF6, Vacuum circuit breakers, HVDC circuit breaker, Testing of Circuit Breaker. [7]

Outcome: After completion of the course, students would be able to apply the knowledge of CB, various relaying schemes and overvoltage and protection against overvoltage.

Text Books:

1. Badri Ram and Vishwakarma, D.N., "Power System Protection and Switchgear", McGraw HillPublishing, 3rd Edition, 2001.
2. Ravindranath, B. and Chander, N., "Power System Protection and Switch Gear", New AgeInternational (P) Ltd,3rd Edition, Reprint 1996.

Reference Books:

1. Sunil S.Rao, "Protective Switch Gear", Khanna Publishers, 2nd Edition, 2000.
2. Y. G. Paithangar, "Fundamentals of power system protection", PHI Learning Private Limited, 4th Edition, 2010.

EE-14.403 **Electric Drives and Control** **Total Lectures: 40**

3-1-0-4

Objective: This course aims to equip the students with a basic understanding of Electric drive system and their controls. The course also equips students with ability to understand selection of motor for industrial drive applications, and develops the ability to understand the characteristics and speed control of motors using power electronics based circuits.

Pre-requisite: Power Electronics, Electrical Machines and Control System.

1 **Introduction :**Introduction to an electric drive system, parts of electric drive system, choice criteria for drive system [5]

2 **Dynamics of Electric Drives:** Dynamic equations of an electric drive, torque equations, multi-quadrant operation, type of loads, energy loss during transients and load equalization. [5]

3 **Electric Drive Control:** Control of electric drives, modes of operation, speed control, open & closed loop drives, current limit control, torque limit control, position, PLL and speed control. [6]

4 **Selection of Motor Drive Rating:** Selection of motor rating – thermal model of motor, classes of duty and determination of motor rating for different classes of drive operation duty. [6]

5 **Control of DC Motor:** DC motor drive – starting, braking, transient analysis, speed control, controlled rectifier converters for DC drives and chopper fed DC drives. [9]

6 **Control of AC Motors:** Induction motor drive – starting, braking, transient analysis, speed control, Control of Induction Motor by AC Voltage controllers-Waveforms, Speed torque characteristics, Variable frequency control of induction motor by Voltage Source, Current Source inverters and cycloconverters. [9]

Outcome: After completion of the course, students would be able to apply the knowledge of various drives, their selection criteria and its control mechanisms for domestic and industrial applications.

Text Books:

1. Dubey G.K. “Fundamentals of Electrical Drives”,Narosa Publications, New Delhi, 2nd Edition 1995.
2. Gopal K. Dubey, “Power semiconductor Controlled Drives”, PHI publications, Newest 1st Edition 1989.

Reference Books:

2. Pillai S.K., “A first course on Electrical Drives”, New age International Publisher, 2nd Edition 1989.
3. U. A. Bakshi, M. V. Bakshi, “Electrical Drives and Controls”, Technical Publications Pune, 1st Edition 2009.

EE-14.441 **Engineering Economics** **Total Lectures: 26**

2-0-0-2

Objective(s):
1. Provide students with fundamental concepts of engineering economics.
2. Provide students with economical methods to compare and evaluate alternatives based on present, annual, rate of return, and benefit over cost analyses.
3. Emphasize practical engineering-based applications and the use of real data examples.

Prerequisite(s): Nil

1. **Introduction**: Definitions, Scope; Microeconomics vs. Macroeconomics; Engineering and engineering economics; Principles of engineering economics. **[2]**
2. **Theory of Demand & Supply**: Determinants, law of demand, law of supply, equilibrium, elasticity of demand. **[3]**
3. **Economics Applied to Industries**: Theory of production; production function, Law of variable proportions, Returns to scale, Theory of cost; Various concepts of cost: Fixed cost, variable cost, average cost, marginal cost, money cost, real cost, opportunity cost, average cost, marginal cost, total cost etc, Break even analysis. **[6]**
4. **Market Structures& Pricing Techniques:** Meaning of Market, Types of Market- perfect competition, Monopoly, Oligopoly, Monopolistic Competition (Main features of these markets). **[5]**
5. **Replacement analysis and depreciation**: Replacement Analysis Decision Map, Basic aspects of depreciation, Deterioration & Obsolescence, and its methods **[3]**
6. **Optimization technique**: Optimization under constraints and without constraints, optimal resource allocation, optimization under risk and uncertainty. **[4]**
7. **Capital budgeting**: Concept; under certainty and uncertainty, Techniques; Discounting &compounding techniques, IRR, NPV, PBP, Profitability index, Accounting rate of return. **[3]**

Outcome(s):
1. Understand major principles of economic analysis for decision making among alternative courses of action in engineering.
2. Apply cost estimation and alternative analysis techniques for engineering applications.
3. Recognize the economic impact of engineering solutions.
4. Calculate depreciations and understand the impact of inflation.
5. Perform breakeven analysis for a single project and between two alternatives.

Text Books:

1. Salvatore, Dominick. Managerial Economics, Prentice Hall of India, 6th Ed., 2010.
2. D.N. Dwivedi, Managerial Economics, Oxford University Press,Vikas Publication, 7th Ed., 2014.

Reference Books:

1. Suma Damodran, Managerial Economics, Oxford University Press, 2nd Ed, 2005.

EE-14.405 **Electrical Machine Design** **Total Lectures: 42**

3-1-0-4

Objective: To provide knowledge of design aspects of various dc machines, ac machines and transformers.

Pre-requisite: Electrical Machines

1 **Fundamentals of Electrical Machine Design:** Standard specification of frame size, conductors and insulation, Magnetization and loss curves, Choice of specific loadings Heating and cooling of electrical machines. [6]

2 **D.C Machines:** Construction details, output equation, main dimensions, Choice of specific loadings, choice of number of poles, armature design, design of field poles and field coils ,design of commutator and brushes. [10]

3 **Transformers:** Construction details of core and shell type transformers, output rating of single phase and three phase transformers, optimum design of transformers, design of yoke, core and winding for core and shell type transformers, equivalent circuit parameters from design data and design of tank and cooling tubes of transformers. [10]

4 **A.C. Machines:** Construction details of A.C. machines, output equation, main dimensions, Choice of specific loadings, design of stator, design of squirrel cage and slip ring rotor equivalent circuit parameter from design data, Short circuit ratio, design of rotor of cylindrical pole and salient pole machines. [10]

5 **Computer Aided Design:** Need for computer aided design, Analysis method, Synthesis method, Introduction to analysis of Electric machine parameters using FEM. [6]

Outcome: After completion of the course, students would be able to apply the knowledge of magnetism in the design of transformer and rotating electrical machines.

Text Books:

1. A.K. Sawhney, A course in Electrical Machine Design, DhanpatRai and sons, New Delhi, 2nd Edition, 2002.
2. S K Sen, Principles of Electrical Machine Design with Computer Programme,Oxford and IBH publishing Co. Pvt Ltd., New Delhi, 3rd Edition, 2004.

Reference Books:

1. R.K Agarwal, Principles of Electrical Machine Design, S.K.Katariasons, New Delhi, 4th Edition, 2002.
2. V.N. Mittle and A. Mittle, Design of Electrical Machines, Standard Publications and Distributors, Delhi, 3rd Edition, 2002.

EE-14.421 **Power Systems Laboratory**

0-0-2-1

Objective: To develop understanding of power system equipment and protective relays used in power system.

Pre-requisite: Power System Protection, Transmission and Distribution

6. To study and testing the operation Gas actuated Buchholz Relay.
7. To study and testing of IDMT type Over current Relay with different and time setting & draw characteristics.
8. To study and testing of under voltage relay with different voltage setting multiplier & plot IDMT characteristics.
9. To study and testing of under frequency relay with IDMT characteristics.
10. To study and testing of microcontroller based Earth Fault relay with IDMT and DMT mode.
11. To study and testing the operating characteristics of percentage-biased differential relays and plot the characteristics of percentage biased differential relay for 30%, 40%, & 20%.
12. Draw I-V and P-V characteristics of PV panel by variable resistive load and find out maximum power point by FF calculation.
13. Draw I-V and P-V characteristics of PV panel by varying duty cycle with constant resistive load.
14. Develop a MPPT algorithm for tracking maximum power by analyzing I-V & P-V characteristics of PV panel.
15. Use buck-boost converter for MPPT controller and find out total efficiency of the system.
16. To Measure sending and receiving end line parameters of short/medium/long transmission line and Modeling of transmission line model.
17. To compute of line parameters and Modeling of Transmission Lines using MATLAB.
18. Simulation of load Flow analysis and related problems using Newton-Raphson and Fast-Decoupled methods using MATLAB.
19. Simulation of transient and small signal stability analysis: single-machine Infinite Bus System using SIMULINK.
20. Transient Stability Analysis of Multi-machine Power Systems using MATLAB.

Outcome: The students will develop an insightful knowledge on various protective relays, smart grid and MATLAB simulation.

Text Books:

1. Wadhwa C.L., Electrical Power Systems Electronics, New Age International Publishers, 4th Edition, 2011.
2. Sunil S. Rao, Switchgear and Protection, Khanna publishers, 3rd Edition, 2001.

Reference Books:

1. Uppal, S.L., Electric Power, Khanna Publishers, 13th Edition, 2008.

EE-14.423 **Advanced Electrical Simulation Laboratory**

0-0-2-1

Objective: To enhance the model building, advanced analyzing and problem solving skills of the students in the area of power system, power electronics and control through computer programming and simulation.

Prerequisites: Fundamentals of power system power electronics and control system.

1. Building a One-Line Diagram of conventional power system and study of various power system components.
2. Building a simulation model of power system with renewable like solar and wind.
3. Calculation of Transmission Line Parameters.
4. Real and Reactive Power Computation for a given power system.
5. Load flow analysis.
6. Simulation of various faults and short circuit analysis for a given power system.
7. Simulation and study of various power quality events like voltage sag, harmonics and transients etc.
8. Developing a simple simulation models for harmonic filter in power system distribution lines.

Outcome: Upon completion of the course students will be able to

1. Develop computer programs for advanced power system studies.
2. Develop computer models for power system components.
3. Simulate and visualize the real time phenomenon.

Text Books:

1. Nagrath I. J.& Kothari D. P., "Modern Power System Analysis", McGraw Hill Education Private Ltd, 11th Edition, 2014.
2. Pai M. A,"Computer Techniques in Power Systems Analysis", Mc Graw Hill Publication Company Ltd, 2nd Edition, 1979.

Reference Books:

1. Kusic G.L, "Computer Aided Power Systems Analysis", CRC Press, 2nd Edition, 2008.

EE-14.433 **Industrial Training Seminar**

0-0-0-2

Industrial training plays a very important role for engineering graduates of all disciplines. As an engineering student, training can help to implement the concepts that students have learnt in their classes.

Objective: To enhance the knowledge of the students on different cutting edge technologies which have become important part of respective industries.

Pre-requisite: Nil

Industrial training offers the following:

1. Experience of industrial environment/conditions to girls students.
2. Enable the students to learn engineering techniques by observation and practice.
3. Show how theory presented in class is applied in practice.
4. Provide contact with practicing engineers.
5. Familiarize the student with practices and problems faced by companies employing engineers.
6. Give the student the responsibility of completing a piece of work.
7. Enable and accord industry opportunity to shape and participate in the development of future human resources

Outcome and Assessment:

1. Ability to acquire and apply fundamental principles of science and engineering.
2. Capability to communicate effectively.
3. Ability to identify, formulate and model problems and find engineering solution based on a systems approach.
4. Ability to conduct research in the chosen fields of engineering.
5. Understanding of the importance of sustainability and cost-effectiveness in design and developments of engineering solution.
6. Ability to be a multi-skilled engineer with good technical knowledge, management, leadership and entrepreneurship skills.
7. Awareness of the social, cultural, global and environmental responsibility as an engineer.
8. Capability and enthusiasm for self-improvement through continuous professional development and life-long learning.

EE-14.442 **Principles and Practices of Management** **Total Lectures : 26**

2-0-0-2

Objective(s):

1. To expose the students to fundamental concepts of management and its processes in organizations.
2. To describe the various skills necessary for effective managers.
3. To explain the Individual and Group Behavior along with various leadership Styles

Prerequisite(s): Nil

1. **Planning and Organizing:** Management: Concept, Nature and functions; Planning: Concept, Missions, Objective and Strategies, Steps in Planning; Organizing: Concept, Formal an Informal Organization, Decentralization of Authority, Delegation of Authority, Principles of Organizing, Line and Staff Authority. **[5]**
2. **Staffing and Controlling:** Staffing: Definition, Recruitment, Selection, Placement, Promotion, Separation, Performance Appraisal; Controlling: Concepts and Process, Controlling as a Feedback System, Requirements for Effective Control. **[4]**
3. **Motivation:** Concept; Theories and Process of Motivation: Maslow's Need-Hierarchy Theory, Herzberg's Hygiene Theory, Goal-Setting Theory, Vroom's Expectancy Theory. **[4]**
4. **Personality:** Concept and Determinates, Types and Traits, Personality Attributes Influencing Organizational Behavior, Locus of Control, Machiavellianism, Self-Esteem, Self-Monitoring, Risk-Taking. **[3]**

5 **Group Behavior and Interpersonal Relationship:** Groups: Concept and Classification, Stages of Group Development, Roles and Norms, Group Decision-Making: Group versus Individual, Group Decision Making Techniques and Process, Interpersonal Relationships, Understanding Self and Others, Developing Interpersonal Relationships, Transactional Analysis, Johari Window. **[6]**

6. **Leadership:** Concept and Functions; Theories of Leadership: Traits, Behavioral, Situational/Contingency; Inspirational approaches to Leadership: Charismatic Leadership, Transformational Leadership, Transactional Leadership, and Contemporary Leadership. **[4]**

Outcome(s): By studying this Course, students would be able to understand various Management functions, individual and group behavior. They would also know various styles of Leadership and its applicability. The course would help the students in understanding various organizational contexts and help them understand organizational systems in a better way.

Text Books:

1. Koontz, Harold and Weihrich, Heinz, Essentials of Management: An International, Innovation and Leadership Perspective, McGraw Hill Private Limited, India, 10th Edition, 2015.
2. Robbins, Stephen P., Timothy Judge and Neharika Vohra, Organizational Behavior, Pearson Education, 12th Ed., 2011.

Reference Books:

1. Prasad L. M., Principles and Practice of Management, Sultan Chand & Sons, 9th Edition, 2015
2. Fred Luthans, Organizational Behavior, McGraw Hill, 11th Ed., 2009

EE-14.434 **Technical Seminar**

0-0-0-2

Objective:

1. To encourage the students to study advanced engineering developments and state-of-the-art activities.
2. To develop skills to prepare technical report writing and presentation.
3. To encourage the students to use various teaching aids such as overhead projectors, power point presentation and demonstrative models.

During the seminar session each student is expected to prepare and present a topic on engineering/ technology, for duration of about 10 to 15 minutes. The performance of the student will be evaluated based on slide preparation, presentation, ability to address question, etc. At the end of the semester, she will have to submit a technical report on her topic of seminar.

Outcome:

1. Ability to review, prepare and present technological developments
2. Ability to face the placement interviews

EE-14.411 **Smart Grid** **Total Lectures: 40**

3-0-0-3

Objective:
- This course aims to equip the students to understand the change in electricity power business from conventional sectors to smart grid sectors.
- To understand and analyze the basic architecture of smart grid and functions of its various components like renewables generation, measurement and communication system etc.

Pre-requisite: Power system , Electrical Measurement & Instrumentation

1 **The Traditional Power Generation and Transmission System:** Introduction, Power System reliability and quality, Voltage profile of power system, Power transfer Through radial feeder, Power system stability and control, Protection system, SCADA System. [8]

2 **Smart Grid:** Introduction, Characteristics of Smart Grid, Traditional Grid Versus Smart Grid, Evolution of Smart Grid, Components of Smart Grid, The Environmental Impacts of Smart Grid, Technologies Required for Smart Grid. [8]

3 **Renewable Energy Integration:** Introduction, Solar Energy, Wind Energy, Distributed Energy Resources Integration Challenges, Forecasting and Scheduling, Impacts of Renewable Energy into the Grid. [8]

4 **Smart Grid Communications and Measurement Technology:** Communication, Measurement and Monitoring Technologies, Wide Area Monitoring Systems (WAMS), Phasor Measurement Units (PMU) ,Smart Appliances, Advanced Metering Infrastructure (AMI),Communication Protocols. [10]

5 **Smart Meter:** Details Description of Smart Meter, Benefits of Smart Meter, Technical Configurations of Smart Meter, Components of Smart Meter Network in Distribution System, and Characteristics of smart meters. [6]

Outcome: Upon completion of the course the student will be able to:

1. Understand the difference between conventional grid and smart grid.
2. Understand the integration necessity and challenges of renewable in conventional grid system.
3. Understand the operation of communication and measurement technology in modern grid context.

Text Books:

1 Momoh James., "Smart Grid Fundamentals of Design and Analysis" ,John Wiley &Sons, Inc., Hoboken, New Jersey, 4th Edition, 2012

2 Bollen, Math and Hassan F, "Integration of Distributed Generation in The Power System", IEEE press, 2011.

Reference Books:

1 Shawkat Ali A. B. M., "Smart Grids Opportunities, Developments and Trends", Springer Verlag, London, 4th Edition, 2013.

2 Chowdhury S., Crossley P. "Microgrids and Active Distribution Networks" The Institution of Engineering and Technology, UK, 3rd Edition, 2009.

EE-14.413 **Modern Control System** **Total Lectures: 40**

3-0-0-3

Objective: To impart knowledge about advances in control system in the areas of state-space modeling & stability of continuous & discrete system. It will also make students familiar with the non-linear system – their modeling and analysis. At the end of the course a student will be equipped to handle linear and non-linear control problems.

Pre-requisite: Linear Control System

1 **State Space Analysis of Continuous Time Systems**: State variable representation – Conversion of state variable form to transfer function and vice versa – Eigenvalues and Eigenvectors – Solution of state equation – Controllability and observability –Pole placement design – Design of state observer [8]

2 **Z-Transform and Sampled Data Systems:** Sampled data theory – Sampling process – Sampling theorem – Signal reconstruction –Sample and hold circuits – z-Transform – Theorems on z-Transforms – Inverse z-Transforms – Discrete systems and solution of difference equation using z transform – Pulse transfer function – Response of sampled data system to step and ramp Inputs – Stability studies –Jury's test and bilinear transformation. [6]

3 **State Space Analysis of Discrete Time Systems**: State variables – Canonical forms – Digitalization – Solution of state equations –Controllability and Observability – Effect of sampling time on controllability – Pole placement by state feedback – Linear observer design – First order and second order problems [6]

4 **Nonlinear Systems:**Types of nonlinearity – Typical examples – Phase-plane analysis – Singular points – Limit cycles – Construction of phase trajectories – Describing function method – Basic concepts –Dead Zone – Saturation – Relay – Backlash – Liapunov stability analysis – Stability in the sense of Liapunov – Definiteness of scalar functions – Quadratic forms – Second method of Liapunov – Liapunov stability analysis of linear time invariant systems and non-linear system [6]

5 **MIMO Systems:**Models of MIMO system – Matrix representation – Transfer function representation – Poles and Zeros – Decoupling – Introduction to multivariable Nyquist plot and singular values analysis – Model predictive control. [5]

Outcome: Upon completion of the course the student will be able to develop the mathematical models for various types of systems using different techniques.

Text Books:

1. M. Gopal, "Digital Control and State Variable Methods", McGraw Hill Publication,4th Edition, 2012.
2. Katsuhiko Ogata, "Modern Control Engineering", Prentice Hall, 3rd Edition, 1997.

Reference Books:

1. Katsuhiko Ogata, "Discrete-Time Control Systems", Pearson Education, 2nd Edition, 2002.
2. Richard C. Dorf and Robert H., "Modern Control Systems", 8thEdition, PearsonEducation, 2004.

EE-14.415 **Power Quality** **Total Lectures: 40**

3-0-0-3

Objective: This course aims to equip the students with an understanding of emanation of various power quality disturbances their cause, effects and remedial action in particular to harmonics distortion.

Pre-requisite: Power system, Power Electronics

1 **Introduction:** Introduction, power quality -voltage quality, power quality evaluations procedures term and definition:general classes of power quality problem, causes & effect of power quality disturbances. [6]

2 **Voltage Sags and Interruption:** Voltage sags and interruption: sources of sags and interruption, estimating voltages sag performance, fundamental principles of protection, monitoring sags. [6]

3 **Transient Over Voltages:** Sources of transient over voltages, principles of overvoltage protection, devices for overvoltage protection, utility capacitor-switching transients, utility system lightning protection, managing ferro-resonance , switching transient problems with loads. [8]

4 **Harmonics:** Harmonic distortion, voltage versus current distortion, harmonics versus transients, harmonic indexes, harmonic sources from commercial loads, harmonic sources from industrial loads, locating harmonic sources, system response characteristics, effects of harmonic distortion, inter-harmonics. [10]

5 **Applied Harmonics:** Harmonics distortion evaluations, principles for controlling harmonics, harmonics studies devices for controlling harmonic distortion, filters, passive input filter standards of harmonics. [10]

Outcome: Upon completion of the course The student will be able understand

1. The reason for occurrence of power quality disturbances.
2. The difference between disturbing signals like sag, swell transients, harmonics.
3. Various types of filters to filter out the harmonic problems.

Text Books:

1. Dugan R. C.,"Electrical Power System Quality", McGraw Hill Publication, 3rd edition, 2008.
2. Arrillga A.J., "Power System harmonics", Wiley publication, 2nd edition, 2003.

Reference Books:

1. Derek A. Paice, "Power electronic converter harmonics",Wiley publication, 3rd Edition,1999.

EC-14.413 **FPGA Architecture and Applications** **Total Lectures: 40**
3-0-0-3

Objective: To acquire fundamental knowledge of designing and implementation of digital systems in programmable logic devices using CAD tools.

Pre-requisite: EC-14.203 Digital Electronics, Knowledge of Computer Architecture

1. **Digital System Design:** Moore and Mealy circuits, Design procedure of combinational and sequential systems, State table and State reduction [8]
2. **PLD Programming Technologies:** EPROM, EEPROM, Anti-Fuse, SRAM Programmable Logic Devices (PLD): ASIC, ROM, PLA, PAL and CPLD – Architecture and applications, advantages and disadvantages of ASIC and PLD based design. [9]
3. **FPGAs:** Evaluation of FPGA, Internal Structure of FPGA: Logic blocks, I/O Blocks, Routing technique, Clock resources and switch technologies. Case studies Xilinx XC4000 and ALTERA's FLEX 8000/10000 FPGA, Differences in Xilinx, Altera, Actel and Quicklogic FPGAs and Advanced FPGAs [14]
4. **Front End Digital Design Tools for FPGAs:**Role of VHDL in FPGA based design, review of VHDL constructs, FPGA design flow using Xilinx Integrated Software Environment, Simulation tool, Synthesis tool. Place and Route tool [9]

Outcome: After completion of the course, students would be able to:

1. Identify, formulate, and solve engineering problems
2. To use the technique, skills, and modern engineering tools necessary for engineering practice.

Text Books:

5. Mano, M.M., "Digital Design", PHI, New Delhi, 2nd Edition, 2001.
6. Trimberger, S., "Field Programmable Gate Array Technology", Kluwer Academic Publications, 2nd Edition, 1994.

Reference Books:

5. Chan, P.K.&Mourad,S., "Digital Design Using Field Programmable Gate Array", Prentice H 3rd Edition, 2010.
6. Brown, S, Francis, R.J, Rose, J and Vranesic, Z.G., "Field programmable gate array", BSP, 2nd Edition, 2007.
7. Lala, P.K., "Digital System Design using Programmable Logic Devices", Springer/BSP, 4th Edition, 2007.

EE-14.404 **Renewable Energy Systems** **Total Lectures: 40**

3-0-0-3

Objective: This course provides the principles of renewable technologies for sustainable future. It also provides the details of renewable resources, energy conversion techniques and applications of solar, wind, biomass, geothermal, hydro-electric, wave and tidal energy technologies.

Pre-requisite: Power Plant Engineering

1 **Energy Scenario:** Energy Resources: Conventional and non-conventional, Energy needs of India, Energy consumption patterns, Worldwide Potentials of these sources, Energy efficiency, Energy security, Energy and its environmental impacts, Global environmental concern, Kyoto Protocol, Concepts of Clean Development Mechanism (CDM) and Prototype Carbon Funds (PCF),Factors favoring and against renewable energy sources. [8]

2 **Solar Energy:** Solar Energy basics-Extraterrestrial and Terrestrial radiation, Spectral energy distribution, Solar Radiation Geometry, Empirical equation for estimating solar radiation on horizontal surface. Solar Thermal Systems, Types of collectors-Concentrating and Flat plate, Efficiency calculations, Solar water heater- thermosiphon and pumped, Greenhouses heating and cooling, Photo Voltaic (PV) technology, Solar cells, Characteristic of PV systems, Equivalent circuit, Array design, Standalone and grid interactive system. [8]

3 **Wind Energy:** Wind Energy, Wind speed and power relation, Power extracted from wind, Wind distribution and wind speed predictions, Wind power systems, System components, Types of turbine, Turbine rating, Variable speed operation, Maximum power Operation, Control systems, System design features, Standalone and grid connected operation. [8]

4 **Other Energy Sources:** Biomass, Various resources, Energy contents, Technological advancements, Conversion of biomass in other form of energy, solid, liquid and gases, Gasoliers, Biomass fired boilers, Co firing, Energy Generation from agro-dairy apart from municipal waste ,used for vehicles , Hydro energy, Feasibility of small, mini and hydel plants: scheme, layout and economics, Tidal and wave energy, Geothermal and Ocean, Thermal Energy Conversion (OTEC) systems, Schemes, feasibility and viability [8]

5 **Energy Storage and Hybrid System Configurations:** Energy storage, Battery, Types, Equivalent circuit, Performance characteristics, Battery design, Charging and charge regulators, Battery management, Fly wheel energy relations, Components, Benefits over battery,Fuel cell energy, Storage systems and Ultra capacitors, Energy Management. [8]

Outcome: Upon completion of this course, the students should be able to:

1. Recognize the need of renewable energy technologies and their role in the world energy demand.
2. Distinguish between the sustainable energy sources and fossil energy sources
3. Describe the principles of renewable energy production from various renewable sources.

Text Books:

1. Rai G.D. "Non- Conventional Energy Sources", Khanna Publishers, 4th Edition,2004.
2. Khan B.H., "Non-Conventional Energy Resources",McGraw-Hill Education Private Limited, 2nd Edition, 2015.

Reference Books:

4. Kothari D.P. and Singal K.C. "Renewable Energy Sources and Emerging Technologies", PHI Learning Private Limited, 2nd Edition, 2011.
5. Boyle, G. "Renewable energy: Power for a sustainable future" Oxford University press, 3rd Edition, 2014.

EC-14.306 **Microcontroller and Embedded Systems** **Total Lectures: 40**

3-0-0-3

Objective: The objective of this course is to teach students design and interfacing of microcontroller-based embedded systems. The course covers fundamentals, The 8051 Architecture, Assembly Language Programming, Instruction set, Serial Communication and Interfacing techniques of 8051 Microcontroller.

Pre-requisite: Programming skills and fundamental knowledge of microcontrollers, microprocessors and digital design.

1. **Introduction to Microcontrollers, Architecture and Memory Interfacing:** [7] Overview of the 8051 family, 8051 Microcontroller's Architecture, Pin configuration, Common memory types and Tradeoffs, External Memory interfacing.
2. **Programming of 8051:** Addressing modes of 8051, instruction set of 8051, assembly language programming of 8051, stack structure of 8085, delays, and subroutines, Applications of interrupts, timer/counter and serial port, Components of Integrated Development Environment for software development. [16]
3. **Interfacing of 8051:** Interfacing of 8051 with sensors, Keyboard, ADC, DAC, LCD, Stepper Motor and D.C motor. [8]
4. **Introduction to Embedded systems and Processors:** Introduction and Examples of Embedded Systems, Concept of Embedded System. Design challenge, Processor technology, IC technology, design technology, Trade-offs: Custom single purpose processor hardware, general-purpose processor: introduction, basic architecture, operation, super-scalar architecture, application specific instruction set processors, microcontrollers, digital signal processors, selection of embedded processor. [6]
5. **Software Aspect of Embedded System:** Challenges and issues in embedded software development, Software and hardware requirements, Real time system, Real time operating systems, Kernel, architecture: mutex, semaphore, testing and verification. [3]

Outcome: Upon completion of this course, the student will be able to:

1. Program, build and test a microcontroller system.
2. Interface a microcontroller system to user controls and other electronic systems.
3. Describe the internal architecture of microcontroller systems, including counters, timers, ports, and memory.
4. Understand and design embedded systems and real-time systems.
5. For real-time systems:
   - Identify the unique characteristics of real-time systems.
   - Explain the general structure of a real-time system.
   - Define the unique design problems and challenges of real-time systems.

Text Books:

1. M. A. Mazidi, "The 8051 Microcontroller & Embedded Systems", Pearson Education, 2nd Edition, 2007.
2. I. Scott McKenzie and Raphael C.W. Phan,"The 8051 Microcontroller" Pearson Education, 3rd Edition, 2012.

Reference Books:

1. David E Simon, "An Embedded Software Primer",Pearson Education Asia, 12th Edition, 2005.

2. Raj Kamal, "Embeded System", Mcgraw-Hill. 2nd Ed., 2011.

EE-14.412 **EHV AC & DC Transmission** **Total Lectures: 40**
3-0-0-3

Objective: To provide an in-depth understanding of the different aspects of Extra High Voltage A.C. and D.C. Transmission system design and Analysis.

Pre-requisite: Transmission & Distribution & Power System Analysis

1. **EHV AC System:** Flexible AC transmission, control of FACTS devices, reactive power planning, static VAR compensation, optimal location, Sub-synchronous resonance, Ferro-resonance, true saturation characteristic. [6]
2. **Transients in Three Phase EHV AC system:** Switching of three phase transformer banks, transmission lines, capacitive banks, effects of neutral connection. Symmetrical component method of analysis of three phase switching transients, effect of open conductors. EMTP application. [6]
3. **Traveling Waves:** Generation of traveling waves, refraction and attenuation of waves, effects of line terminators, multi-conductor systems. [6]
4. **Protection of EHV AC Lines:** Protection against switching over-voltages, lightning over-voltages. Surge diverters, surge capacitors and reactors, overhead ground wires. [6]
5. **HVDC Systems:** Comparison with AC systems. Various configurations, inversion and conversion, operation and control, harmonics and filters. Parallel operation of HVDC/AC system. Back to back connections. Multi-terminal HVDC system. Transients in HVDC converters. [6]
6. **Overvoltage and Insulation Coordination:** Lightning, switching and temporary overvoltage, BIL and SIL, methods of insulation coordination, conventional and statistical methods. [6]
7. **Gas Insulated Systems:** Gas Insulated lines, substations, advantages and problems. [4]

Outcome:
1. Understand issues of concern with EHVAC& DC transmission
2. identify and calculate the various parameters of EHV line for modeling
3. Estimate the over–voltages in EHV AC systems and protect against it.
4. Understand insulation coordination and gas insulated system.

Text Books:
1. Rakesh Das Begamudre, "Extra High Voltage Ac Transmission Engineering", New Age International, 4th Edition, 2011.
2. Padiyar. K. R.,"HVDC Power Transmission Systems", New Academic Science, 2nd Edition, 2011

Reference Books:
1. A Chakraborti, D.P. Kothari "Performance, Operation and Control of EHV Power Transmission Systems", T.M.H publication,2nd Edition, 1983.
2. TuranGonen "Electric Power Transmission System Engineering",Taylor & Francis, 2nd Edition,2007.

EE-14.414 **Computer Application in Power Systems** **Total Lectures: 40**
3-0-0-3

Objective: This course is designed to give students the required knowledge for the design and analysis of electrical power grids by using computer programs or a software. The computer programs or software make easy calculation of power flow in a power system network using various techniques.

Pre-requisite: Transmission & Distribution & Power System Analysis

1 **Network Modeling**: Development of network matrices using graph theory, Z-Bus and Y-Bus formation, component models, fixed tap, variable tap and phase shifting transformers. [5]

2 **Short Circuit Studies of Large Systems:** Symmetrical and asymmetrical fault analysis using Z-Bus and Y-Bus Method. [6]

3 **Advanced Load Flow Studies:** Load models, non-convergence of load flow solutions, remedial measures, second order methods, continuation power flow, sparse vector method. [8]

4. **Economic Operation and Security Analysis:** Optimal power flow problem and its solution methods, contingency evaluation methods; distribution factors, direct and indirect methods, contingency ranking and screening. [8]

5. **Angular and Voltage Stability Analysis:** Steady state and transient stability, mathematical models and numerical solution, voltage stability. [8]

6. **State Estimation:** Algorithm, tracking state estimator, bad data identification, Observability. [5]

Outcome:
1. Upon completing this course student able to analysis of different type fault in a power system by computer methods.
2. Student able to apply computer methods in different load flow techniques.

Text Books:

1. J.J.Grainger & W.D.Stevenson, "Power system Analysis",McGraw Hill, 3rd Edition, 2007.
2. HadiSaadat, "Power System Analysis",McGraw Hill ,2nd Edition, 2002.

Reference Books:

1. D.P.Kothari and I.J.Nagrath, "Modern power system analysis", McGraw HillEducation, 2nd Edition, 2003.
2. T.K.Nagsarkar M.S.Sukhija ,"Power System Analysis", OXFORD university press,4th Edition, 2007.

CS-14.305 **Logic in Computer Science** **Total Lectures: 40**

3-0-0-3

Objective:

1. To introduce the main notions of mathematical logic: logical notations (syntax) and how to assign meaning to them (semantics).
2. To study formal frameworks (in the sense of being rigorous as well as in the sense of manipulating "form") for constructing logical arguments (proof theory).
3. To study some deductive systems for propositional and first-order logic.
4. To introduce the concept of fuzzy logic.

Pre-requisite: CS-14.201(Discrete Structures), CS-14.207(Computer Information Systems)

1. **Introduction:** Role of logic in computer science, problem representation, review of the principle of mathematical induction, the principle of structural induction, review of Boolean algebra, language, models, interpretations, validity, proof, decision problems in logic, decidability. [6]
2. **Propositional Logic:** Syntax, semantics, logical and algebraic concepts, identities and normal forms, tautology checking, propositional un-satisfiability, propositional resolution and tableaux method. [10]
3. **First Order Predicate Logic:**Quantifiers, first order models, validity and satisfiability, forward and backward chaining, skolmization, normal forms, unification, Horn formulas and programs, resolution and tableaux. [12]
4. **Binary Decision Diagrams:**Representing Boolean functions, algorithms for ordered reduced binary decision diagram (OBDD), geometric templates from spatial relations, image based rendering, symbolic model checking, relational Mu-calculus, coding CTL models and specification. [8]
5. **Fuzzy Logic:**Classic sets, fuzzy sets and membership, fuzzy set operations, Cartesian product, operations and properties of crisp relationship, operations and properties of fuzzy relationship. [4]

Outcome: On successful completion of this course, the students will be able to

1. Use propositional and first-order logic.
2. Apply of logic in specifying properties.
3. Design binary decision diagrams.

Text Books:

1. Huth M and Ryan M, Logic in Computer Science: Modelling and Reasoning about Systems, Cambridge University Press, 2nd edition, 2004.
2. Enderton H B, A Mathematical Introduction to Logic, Academic Press, 2nd edition, 2001.

Reference Books:

5.	**ET 362**	**Mobile Apps Development (Infosys)**

.

CA 16.103 **C- Programming** **3-0-0-3**

Total Lectures: 40

1. **Introductory Concepts:** Introduction to computers, Computer characteristics, Types of programming languages, Introduction to C, identifiers and keywords, Data types: declaration and definition, Type conversion. [6]
2. **Operators:** Arithmetic, relational, logical, bitwise, unary, assignment, Increment and Decrement operators, conditional operators and their hierarchy, associativity, Data input/output. [8]
3. **Control Structure:** Introduction, Conditional Statements; Simple If-Else; Nested Statements, switch, Loops- For, While, Do-While; Break, Continue, Go-To Statements, Labels, Printf, Scanf function. [7]
4. **Array:** Defining an array, processing an array, passing arrays to functions, Multidimensional arrays, Arrays and strings. [6]
5. **Function and Pointer:** A brief overview, Defining a function, accessing a function, function prototypes, passing arguments to a function, recursion, Pointers: Declaration, operations on pointers, array of pointers, pointers to arrays. [7]
6. **Advance C Concepts:** Structure, Union, storage classes in C, Concept of files file access in different modes, reading from and writing into a file, Library Functions. [6]

Text Books:

1. Kernighan, Brain W. and Ritchie, Dennis M., "The C Programming Language," Second edition 2013, Pearson Education.
2. Gottfried ,Byron S. and Schaum's, "Programming with C," 2nd Edition, Tata McGraw-Hill, 2006.

Reference Books:

1 Schildt ,Herbert, "C: The Complete Reference," Fourth edition, McGraw- Hill Education, 2000.

2 Kanetkar ,Yashwant, "Let us C," Fifth Edition BPB Publication,2006.

3 Balagurusamy , E, "Programming in ANSI C," Tata McGraw-Hill Education.

CA 16. 101 **Computers Fundamentals** **3-0-0-3**

Total Lectures:40

1. **Introduction to Computers:** Definition, Block Diagram, characteristics, Applications in Modern Society, History, Classification of computers and Generation of computers. [6]
2. **Functional Units of Computer Processing System:** Hardware, CPU, Memory and secondary storage devices, Input devices, Output Devices, Information Concept and Processing: Data, Information, Knowledge and Wisdom. [8]
3. **Data representation:** Representation of Data, Bits and Bytes, Number System: Decimal, Binary, Octal, Hexadecimal, Conversions b/w number system, Arithmetic Operations in Binary Number, ASCII, EBCDIC and BCD Codes. [8]
4. **Software Concepts:** Types of Software, Generation of Programming Language: Machine Language, Assembly Language, High Level Language, Translator: Assembler, Interpreter, Compiler, Operating System**:** Functions, types of operating system: Batch Processing, Multiprogramming, Multiprocessing, Multitasking, Time Sharing and Real Time System, MS-DOS, MS-Windows. [9]
5. **Data Communication and Computer networks:** The Basic Communication System, Data Transmission Modes, Network types, Network Topologies, Internet and its Applications: E-mail, World Wide Web, Intranet, Extranet, Computer Threats: Virus, Worm, Trojan horse, Malware. [9]

Text Books:

1. Sinha , Pradeep K. and Sinha, Priti, "Computer Fundamentals", BPB Publications, Third Edition.

Reference Books:

1. ITL Education Solutions Limited, "Introduction to Computer Science", Pearson Education, Third Edition, New Delhi.
2. Rajaraman, V., "Introduction to Computer", PHI, New Delhi.
3. Thareja, Reema, "Fundamentals of Computers", Oxford University Press India, Second Edition.

Testing:

- One Dimensional Array
- Two Dimensional Array

Application programs based on above elements in different areas of computing like- Science, Business, Mathematics and other manual processes.

Testing:

- Implementation of Linked List
- Operations on Linked list

Application programs based on above elements in different areas of computing like- Science, Business, Mathematics and other manual processes.

Testing:

- Implementation of stack using array and Link List.
- Operations on stack.

Application programs based on above elements in different areas of computing like- Science, Business, Mathematics and other manual processes.

Testing:

- Implementation of Queue using array
- Operations on queue.

Application programs based on above elements in different areas of computing like- Science, Business, Mathematics and other manual processes.

Testing:

- Searching
- Sorting

Application programs based on above elements in different areas of computing like- Science, Business, Mathematics and other manual processes.

CA 16. 104 **Data Structures** **3-0-0-3**

Total Lectures:40

1. **Introduction**: Overview of data structure, types of data structures and operations. Applications of data structures [2]

2. **Pointer and dynamic memory allocation:** Pointer declaration and initialization, accessing a variable through its pointer, meaning and advantages of dynamic memory allocation, Memory allocation functions. [3]

3. **Array:** Representation of single and multidimensional array. [2]

4. **Sorting and Searching Techniques:** Insertion Sort, Selection Sort, Merge Sort, quick sort, Linear Search, Binary Search [8]

5. **Stack :** Definition and representation of stack, operations on stack, Infix, Postfix, Prefix Expressions, Conversion from Infix to Postfix (Algorithms only). [7]

6. **Queue**: Introduction and types of queues, Primitive Operations on Queues. [7]

7. **Linked List:** Introduction to Linked List, implementation of Linked List, operations on linked list: creation, deletion, search and display [7]

8. **Tree:** Introduction and Terminology, Traversal of Binary Trees [4]

Text Books:

1. Schaum Series, "Data Structures", TMH, New Delhi.

Reference Books:

1 Langsam , Augenstein and Tannenbaum, "Data Structure Using C and C++", PHI, New Delhi.
2 Horowithz and Sahani, "Fundamentals of Data Structure", Galgotia Book Source Pvt. Ltd. , New Delhi.
3 Kanitker Y., "Let us C", BPB Publication New Delhi.
4 Balagurusamy, E , "Programming in C", TMH, New Delhi.

CA 16. 108 **Digital Electronics** **3-1-0-4**

Total Lectures:40

1. **Number System:** Binary, octal, Hexadecimal Number, their addition and substraction, Base conversions, Number code: 8421, Other BCD codes, Grey, ASCII, EBCDIC. Boolean Algebra: Laws and theorems of Boolean algebra. De Morgan's theorem, XOR and XNOR gates, Half and Full Adder and Subtractor circuits. [10]
2. **Fundamentals**: Products, Sum of products and Product of sums, Form of Boolean expressions, Truth Tables and Karnaugh maps, pair reads octets and Karnaugh simplification. Mltiplexers BCD to Decimal to BCD decoders and, decoders' characteristics of digital integrated digitals. [10]
3. **Flip Flop:** RS Flip Flop, Clocked, RS Flip Flop, Edge trigger D Flip Flop. Flip Flop Switching time, OK Flip Flop. JK Master Slave Flip Flop, Clock wave forms, Shift registers: Serial in and serial out, Parallel in and parallel out, Counters: Asynchronous counters Synchronous counters, ring counter. [10]
4. **Memories for Digital:** System: Semiconductor Memories, Memory organization and expansion, classification of memories on' the basis of principles of operation, physical characteristics and fabrication technology, ROM and basic memory cells. [10]

Text Books:

1. Moris Mano, "Digital Logic and Computer Design", PHI Publications, 2002
2. R. P. Jain, "Modern Digital Electronics", TMH, 3rd Edition, 2003.

Reference Books:

1. R.L. Tokheim, "Digital Electronics, Principles and Applications", Tata McGraw Hill, 1999.
2. W. Gothman, "Digital electronics", PHI.
3. S. Salivahanan & S. Arivyhgan. "Digital circuits and design", Vikas Publication, 2001

CA 16.105 **Management Accounting** **2-0-0-2**

Total Lectures: 26

1. **Basics of Accounting:** Nature of accounting information, accounting principles – concepts and conventions, accounting equation and financial statements – sole trade, corporate entities (P&L account, balance sheet including adjustments). [6]
2. **Computerized Accounting:** Uses of Microsoft Excel in accounting, analyses of balance sheet with Excel, Tally software - application. [2]
3. **Analysis and Interpretation of Financial Statements:** Ratio analysis as a tool of decision-making; fund flow statement, cash flow statement. [5]
4. **Basic Cost Concepts:** Meaning, nature, classification; inventory valuation, marginal costing and its usage in managerial decision-making. [7]
5. **Long Term Financing and Capital Budgeting:** Sources of long term finance- shares, debentures, capital budgeting – types of projects, non-discounted and discounted cash flow techniques – payback period, internal rate of return and net present value method. [6]

Text Books:

1. Maheshwari S.N., Management Accounting & Financial Control, Sultan Chand & Sons, 14th Ed., 2003
2. Bodhanwala R. J., Understanding and Analyzing Balance Sheets Using Excel Worksheet, Prentice-Hall of India, 2004.

Reference Books:

1. Horngren C. T., Sundem G.L. and Stratton W. O., Management Accounting, Prentice-Hall of India, 12th Ed., 2003.
2. Narayan S. R., Financial Accounting- A Managerial Perspective, Prentice-Hall of India, 2004.
3. Banerjee A., Financial Accounting – A Managerial Emphasis, Excel Publishing House, 2004.

CA 16.135 **C Programming Laboratory** **0-0-4-2**

1. Introduction to C
Testing:
• Data Types & Operators
• Type Conversions

Programs:
• Significant number of programmes in order to cover all contents of unit 1 (at least 6)

2. Operators
Testing:
• Arithmetic, Relational, logical operators
• Bitwise, unary, assignment operators
• Increment and Decrement operators
• Conditional operators
Programs:
• Significant number of programmes in order to cover all contents of unit 2 (at least 10)

3. Control Structure
Testing:
• If-Else statements
• Nested If-Else statements
• Switch
• Loops- For, While, Do-While
• Break, Continue, Go-To Statements, Labels
Programs:
• Minimum 12 programmes to cover all contents of unit 3

4. Array
Testing:
- Processing an array
- Passing arrays to functions
- Multidimensional arrays
- Strings

Programs:
• Minimum 6 programmes to cover all contents of unit 4

5. Function and Pointer
Testing:
- Function prototypes and passing arguments to a function
- Recursion
- Pointers declaration, operations on pointers
- Array of pointers, pointers to arrays

Programs:
• Minimum 6 programmes to cover all contents of unit 5

6. Advance C Concepts

Testing:

- Structure
- Union
- Storage classes in C
- Reading and writing from/to a file

Programs:

• Minimum 6 programmes to cover all contents of unit 6.

CA 16. 107 **Mathematics** **3-1-0-4**

Total Lectures: 40

1. **Matrix and Determinant:** Definition, types of matrices, addition, subtraction, scalar multiplication and multiplication of matrices, adjoint, inverse, rank of matrix, dependence of vectors, Eigen values and vectors of a matrix, Cayley-Hamilton Theorem (without proof), solution of system of simultaneous equations, definition of determinant, minors, cofactors, properties of determinants. [12]
2. **Differentiation:** : Limit at a point, properties of Limit, computation of limits of various types of functions, continuity at a point, derivative, derivatives of sum, differences, product and quotients, chain rule, derivatives of composite functions, logarithmic differentiation, maxima and minima of functions of single variable. [12]
3. **Integration:** Indefinite integrals, methods of integration substitution, by parts, partial fractions, integration of algebraic and transcedental functions, definite integrals and properties. [8]
4. **Ordinary Differential Equations:** Definition, order and degree of equation, solution of ordinary differential equations of first order and first degree, equations in which variables are separable, homogeneous and reducible to homogeneous equations, linear and reducible to liner equations, exact and reducible to exact equations.. [8]

Text Books:

1. Narayan, Shanti “Integral Calculus”, S. Chand & Company, 19993.

2 Dass, H.K., “Advanced Engineering Mathematics”, S. Chand & Company.

Reference Books:

1 Zill, Dennis G. ,Warren Jones, S. ,Wright and Barlett Learning “Advanced Engineering Mathematics”, Student Edition, Canada,2011

2 Ramana B. V., “Higher Engineering Mathematics”, McGraw Hill, New Delhi,2006.

Testing:

- MS Word

Programs:

- Working with Documents.
- Formatting Documents.
- Setting Page style.
- Creating Tables.
- Drawing.
- Tools.
- Printing Documents.

Testing:

- MS Excel

Programs:

- Spread Sheet & its Applications, Opening Spreadsheet, Menus.
- Entering & Deleting Data.
- Setting Formula.
- Formatting Spreadsheets.
- Working with sheets.
- Creating Charts.
- Using Tools.

Testing:

- MS Access

Programs:

- Starting Access, Access Screen, Creating a New Database.
- Creating Tables.
- Working with Forms.
- Creating queries.
- Finding Information in Databases.
- Creating Reports.
- Types of Reports.
- Printing & Print Preview – Importing data from other databases viz. MS Excel etc.

Testing:

- MS Power Point

Programs:

- Creating a presentation.
- Formatting a Presentation.
- Adding Effects to the Presentation.
- Printing Handouts.

CA 16.102 **Operating System** **3-0-0-3**

Total Lectures:40

1. **Introduction:** Definition and types of operating systems, Batch Systems, multi programming, time sharing, distributed and real-time systems, Operating system structure, Operating System Components and Services, System calls, System Programs, Virtual Machines. [4]
2. **Process Management:** Process Concept, Process States, Process Control Block, Operations with examples from UNIX (fork, exec) and/or Windows, Inter-process communication (shared memory and message passing), Scheduling Algorithms, Performance Evaluation. [7]
3. **Threads:** multithreaded model, scheduler activations, examples of threaded programs. Scheduling: multi-programming and time sharing, scheduling algorithms, multiprocessor scheduling, thread scheduling. [5]
4. **Process synchronization and Deadlocks:** critical sections, classical two process and n-process solutions, hardware primitives for synchronization, semaphores, monitors, classical problems in synchronization (producer-consumer, readers-writer, dining philosophers, etc.). Deadlocks-System model, Characterization, Deadlock prevention, Avoidance and Detection, Recovery from deadlock, Combined approach to deadlock handling. [8]
5. **Memory Management:** Logical and Physical Address Space, Swapping, Contiguous Allocation, paging and segmentation, demand paging, virtual memory, page replacement algorithms. [5]
6. **File Management:** Directory systems, File System Implementation issue, access methods, Allocation Methods, Free Space Management. [4]
7. **I/O Management:** Disk Structure, Disk Scheduling, Disk Management, Control of Various Devices, Device Drivers, Interrupt Driven and Poll Driven Data Transfer. [4]
8. **Security and Protection Mechanism:** Computer Security classification, Authentication, System threats, Goals of Protection, Access Matrix. [3]

Text Books:

1. Silbersachatz A.H. and Galvin P.B., “Operating System Concepts”, Pearson Education.
2. Tannenbaum Andrew S., “Operating Systems”, PHI, New Delhi

Reference Books:

1. Stallings William, “Operating Systems: Internals and Design Principles”, Prentice-Hall, New Delhi
2. Dhamdhere D. M. “System Programming and Operating System”, TMH New Delhi
3. Godbole Achyut S, “Operating Systems”, TMH, New Delhi

1. Process and Thread Creation

Testing

- Creation of Process and Thread
- Operations with Process

Programs

- A process to be created with structure or class containing parameters like process- id, arrival time, starting time, end time etc.

2. CPU Scheduling Algorithms

Testing

- Average Waiting Time
- Average Turnaround Time
- Response Time
- Multithreading

Program

- FCFS (with and without arrival time)
- SJF (Preemptive and non-preemptive)
- Round Robin (with and without context switch time)
- Priority scheduling (With and without arrival time)
- Demonstrating time sharing

3. Memory Management Techniques

Testing

- External Fragmentation
- 50% Rule for Fragmentation

Program

- First Fit
- Best Fit
- Worst Fit.

4. Page Replacement Algorithms

Testing

- Belady's Anomaly
- No. of page hits and misses

Program

- FIFO
- LRU
- Optimal Page Replacement Algorithm

5. Deadlock

Testing

- Safety algorithm
- Request algorithm

Program

- Deadlock Avoidance (Banker's Algorithm) for multiple instances of different resource types.
- Deadlock Detection Algorithm for multiple instances of different resource types.

6. I/O

Testing

- Disk Scheduling

Programs

- FCFS algorithm
- Scan algorithm
- C-Scan algorithm

CA 16.106 **System Analysis and Design** **3-0-0-3**

Total Lectures:40

1. **Introduction to system:** Definition, characteristics and elements of system, types of system, System development life cycle, Role of system analyst. [6]

2. **System Planning and Initial Investigation**: Introduction, bases for planning in system analysis, initial investigation, fact finding, information gathering, information gathering tools, fact analysis, determination of feasibility. [6]

3. **Structured Analysis:** Tools of structured analysis: DFD, data dictionary, flow charts, Gantt charts, decision tree, decision table, structured English, pros and cons of each tool. [7]

4. **Feasibility Study**: Objective, types, Steps in feasibility analysis, feasibility report, oral presentation, cost and benefit analysis, classification of costs and benefits. [5]

5. **System Design**: Objective, logical and physical design, design methodologies, structured design, form-driven methodology (IPO charts), structured walkthrough. [6]

6. **Input/ Output and Form Design**: Objectives of input and output design, form design, classifications of forms, requirements of form design. [5]

7. **System Testing and Implementation**: Objectives of testing, test plan, testing techniques/types of system tests, quality assurance goals in system life cycle, System implementation. [5]

Text Books:

1. Awad Elias M, "System Analysis and Design", Galgotia Pub.(P) Ltd.,2nd Edition,2008

Reference Books:

1 Hawayszkiewyez Igor, "Introduction To System Analysis and Design" PHI, New Delhi

2 Mark Lejk and Deeks David , "An Introduction to System Analysis Techniques" PHI, New Delhi.

3 Whitten , Jeffrey L and Lonnie, D Bentey, "System Analysis and Design Methods", TMH. New Delhi

CA 16. 235 **C++ Programming Laboratory** **0-0-4-2**

1. Introduction to C++
Testing:
• Data Types & Operators
• Control Statements
• Arrays
Programs:
• Significant number of programmes in order to cover all contents of unit 1 (at least 6)

2. Classes and Object
Testing:
• Class with function printing hello
• Class with default constructor
• Class with parameterized constructor
• Destructor
• Static and constant data
Programs:
• Apt number of programmes preferably based upon real life examples hotel billing, fee submission etc. (at least 6)

3. Inheritance and Polymorphism
Testing:
• Inheritance
• Function Overloading
• Operator overloading
• Overriding
• Comparisons between private, public and protected
• Virtual function and virtual class
• This pointer
• Exception handling
• Abstract class
Programs:
• Minimum 12 programmes to cover all contents of unit 3

4. I/O handling
Testing:
• Reading and writing from/to a file
• Output formatting
Programs:
• Programmes related with basic file operations (at least 5)

CA 16. 207 **C++ Programming** **3-0-0-3**

Total Lectures:40

1. **Object Oriented Programming:** Basic concepts of object–oriented programming, Structured versus object- oriented programming, merits and demerits of object oriented methodology. [5]
2. **Beginning with C++:** Preprocessor directives, Variables, data types, constants, operators, scope resolution operator, memory management operators, decision and loop control structures, arrays, strings, functions. [7]
3. **Classes and Objects:** Class definition, Structure versus class, accessing member functions within a class, data hiding, arrays within a class, static data and member functions, objects, friend functions and friend classes, constant member functions, pointers to members, constructors and destructor. [8]
4. **Overloading and Exception Handling:** Definition, unary operator overloading, binary operators overloading, overloading of new and delete operators, manipulation of string using operators, type conversion, overloading with friend functions, function overloading, error and exception handling. [8]
5. **Inheritance and Overriding:** Derived and base classes, type of inheritance, derived class constructors and destructor, overriding member functions, public and private inheritance, virtual base classes, abstract classes, this pointer, virtual functions and pure virtual functions, static and dynamic bindings. [8]
6. **Introduction of I/O Streams and the Standard Library:** Header files, I/O stream library, stream I/O for objects, file I/O. [4]

Text Books:

1. Lafore Robert, "Object-Oriented Programming in C++", 4th edition, SAMS.
2. Balagurusamy E., "Object Oriented Programming With C++", 6th edition, Tata McGraw Hill Publishing Co. Ltd., New Delhi.

Reference Books:

1 Stroustrup Bjarne,"Programming -Principles and Practice Using C++", Addison-Wesley.

2 Schildt Herbert, "C++: The Complete Reference", 4th edition, Tata McGraw Hill Publishing Co. Ltd., New Delhi.

CA 16. 201 Computer Architecture 3-1-0-4

Total Lectures:40

1. **Design of Simple Computer**: Micro Operation, Macro Operation, Bus and Memory Transfers, Arithmetic and Logic Micro Operations, Shift Micro Operation, Instruction and Instruction Types. [8]
2. **Instruction Cycle**: Timing and Control Instruction Cycle, Memory Reference Instructions, Input Output and Interrupts, Machine Language Instructions. [5]
3. **Computer Arithmetic**: Hardware algorithm and implementation for Addition, Subtraction, multiplication and division operations, floating point arithmetic operations. [6]
4. **Central Processing Unit**: General Register Organization, Stack Organization, Addressing Modes, Risc vs Cisc Pipeline and Vector Processing, Parallel Processing, Pipelining, Arithmetic Pipeline, Instruction Pipeline, Risc Pipeline, Pipeline Difficulties. [8]
5. **Input Output Organization**: Peripheral Devices, Input-Output Interface, Asynchronous Data Transfer, Modes of Transfer, Programmed I/O, Interrupt I/O Direct Memory Access. [5]
6. **Memory Organization**: Memory Hierarchy, Main Memory, Auxiliary Memory, Associative, Cache Memory, Virtual Memory and Memory Management Hardware. [8]

Text Books:

1. Mano Morris, M., "Computer System Architecture", 3rd edition, Pearson.
2. Stallings William , "Computer Organization and Architecture", 9th Edition, Pearson

Reference Books:

1. Hwang Kai and Jotwani ,Naresh, "Advanced Computer Architecture", 2nd Edition, Tata McGraw Hill.
2. Blanchet ,Gérard, Dupouy, Bertrand, "Computer Architecture", 1st Edition, Wiley Publication.

CA 16. 206 **Computer Graphics** **3-1-0-4**

Total Lectures:40

1 **Basic Concepts:** Application Areas of Computer Graphics, Graphical User Interface, RGB Color model, CMY color models, Advantages of Computer Graphics. [8]

2 **Graphics Hardware:** Random Scan Displays, Raster Scan Display (with Introduction to Flickering, Interlacing, American Standard Video), Color CRT Monitors, Flat Panel Display (Plasma Panel, Liquid Crystal Display, Electroluminescent Display). [7]

3 **Raster Graphics Algorithms:** Line Drawing Algorithms-DDA, Bresenham's Algorithm, Circle and Ellipse Drawing Algorithms, Filling (Scan-Converting Polygon Filling, Inside Outside Tests Boundary Fill and Area Fill Algorithm). Cohen- Sutherland Algorithm of clipping [12]

4 **Transformations:** 2-D Transformations (Rotation, Reflection, Shearing, Scaling), Homogeneous Coordinate Representation, and Translation. [8]

5 **Animation Introduction:** Conventional and Computer-Assisted Animation, Animation languages, methods of controlling Animation, basic rules of Animation. [5]

Text Books:

1. Zhigang X. and Plastock R.A., “Theory and Problems of Computer Graphics (Schaum's Outline)”, Tata Mc Graw Hill, New Delhi.

Reference Books:

1 Hearn Donald D. and Baker M.Pauline, “Computer Graphics” , Prentice Hall India, New Delhi.

2 Krishnamurthy N, “Introduction to Computer Graphics”, Tata Mc Graw Hill Edition, New Delhi.

CA 16. 204 **Computer Networks** **3-1-0-4**

Total Lectures:40

1 **Introduction:** Computer networks; Network topologies, protocols and standards, Network devices: repeaters, bridges, gateway, Routers; categories of networks- LAN, WAN and MAN. [7]

2 **OSI and TCP/IP Model:** Layers and their function, OSI reference model, TCP/IP model, Comparison of models. [5]

3 **Physical layer:** Transmission Media: guided and unguided; Attenuation, Distortion, Noise, Propagation, Switching, ISDN & its service, Multiplexing: Time division & frequency division multiplexing [8]

4 **Data Link Layer:** Functionality, Design Issue, Error Detection & Correction Codes, MAC, Static & Dynamic Channel Allocation, Introduction to IEEE standards. [6]

5 **Network Layer:** Routing Algorithms, Flooding, Broadcast & Multicast routing, congestion Control & internetworking, Quality of services [7]

6. **Application Layer :** Network Security & Privacy, Data Compression & Cryptography, Electronic Mail, The WWW, Multimedia, Audio, Video, DNS, FTP, HTTP, SMTP, telnet etc. [7]

Text Book

1. Tanenbaum A. S., "Computer Networks", Prentice-Hall of India, 4th Ed., 2002.
2. Stallings W., "Data and Computer Communications", Prentice-Hall of India, 5th Ed., 2003.

References Books

1. Forouzan B. A., "Data Communications and Networking", Tata McGraw-Hill, 3rd Ed., 2004.
2. Hayes J. F., "Modeling and Analysis of Computer Communication Networks", Khanna Publishers, 1987.

CA 16.203 **Database Management System** **3-0-0-3**

Total Lectures:40

1. **Introduction**: An Overview of Database Management System, Comparison of Database System and File System, Characteristics of Database Approach, DBMS Architecture, Data Models, Schema and Instances, Data Independence. Data Modeling Using Entity Relationship Model: Entity, Entity Types, Entity Set, Notation for ER Diagram, Attributes and Keys, Concepts of Composite, Derived and Multivalued Attributes, Super Key, Candidate Key, Primary Key, Relationships, Relation Types, Weak Entities, Inheritance, Specialization and Generalization. [10]

2. **Relational Data Model:** Relational Model Terminology: Domains, Attributes, Tuples, Relations, Characteristics of Relations, Relational Constraints: Domain Constraints, Key Constraints, Relational Database Schema, Relational Database Design By ER To Relational Mapping. Introduction to SQL. [11]

3. **Normalization:** Functional Dependencies, Armstrong's Inference Rule, Normal Form up to Boyce Codd Normal Form. [4]

4 **Relational Algebra:** Selection, Projection, Set Theoretic Operations Union, Intersection, Set Difference And Division, Inner, Outer, Left Outer, Right Outer and Full Outer Join. [8]

5. **Transaction Processing And Concurrency Control:** Definition of Transaction, Desirable ACID Properties, Serializable And Non Serializable Transactions, Concurrency, Lost Update, Dirty Read, Concurrency Control Techniques: Locking, 2PL [7]

Text Books:

1. Ramez Elmasri, Shamkant B. Navathe, "Fundamentals of Database Systems", Pearson Education, 7th Edition, 2015.

Reference Book:

1. Jeffrey A. Hoffer, Mary B. Prescott and Fred R. McFadden, "Modern Database Management", Prentice Hall, 8th Edition, 2006.
2. Avi Silberschatz , Henry F. Korth and S. Sudarshan, "Database System Concepts", McGraw-Hill, 6th Edition, 2011.

CA 16.233 Database Management System Laboratory 0-0-4-2

Unit 1: Basic Commands

Testing: Create Table, Insert, Update, Alter, Delete, Where

Queries based on the above elements.

Unit 2: SQL Scalar functions

Testing: UCASE, LCASE, MID, LEN, NOW

Queries based on the above elements.

Unit 3: Aggregate functions

Testing: Max, Min, Sum, Count, Avg , First, Last

Queries based on the above elements.

Unit 4: Clauses

Testing: Distinct, Alias, Order by, Group by, Having

Queries based on the above elements.

Unit 5: Logical Operators

Testing:

OR, AND, Not, Between, Like, All, Any

Queries based on the above elements.

Unit 6: SQL Constraints

Testing: Not NULL, Check, Primary Key, Foreign Key, Cascade delete, Default

Queries based on the above elements.

CA 16. 209 **Discrete Mathematics** **3-1-0-4**

Total Lectures:40

1. **Progressions:** Arithmetic Progression, Arithmetic mean, Harmonic Progression Harmonic mean, Geometric Progression, Geometric mean. [6]

2. **Set Theory:** Definition of Sets, Subsets, Cardinality of Sets, types of sets: Equal Sets, Universal Sets, Finite and Infinite Sets, proper set, power sets, Operations on Sets: Union, Intersection, Complement of Sets, set difference, Cartesian Product, Venn Diagrams, and Algebra of sets, duality, counting principle. [10]

3. **Relations and Functions:** Definition, types of relation, Ordered Pairs, properties of relation, equivalence relations, partial ordering relation. Function: Domain and Range, Onto, Into, and One to One Function, Composite and Inverse Functions. [8]

4. **Prepositional Calculus:** Propositions, Logical Connectives: conjunction, disjunction and negation, Truth Tables, Tautologies and Contradictions, Conditional and Bi-conditional statements. [8]

5. **Group Theory:** Definition of a group, properties of group, different types of group, subgroup, finite, infinitely, countable and Cyclic Groups. [8]

Text Books:

1. Lipschutz, Seymour and Lipson, Mar c “Discrete mathematics”, Tata Mc Graw-Hill Publications, Second Edition.

Reference Books:

1 Rremblay, J.P. and Manohar, R., “Discrete Mathematical Structures with Applications to Computer Science”, The McGraw Hill Companies.
2 Ross, Kolman Busby, “Discrete Matheamatical Structures”, Prentice Hall International.
3 Vasishtha, A. R., “Abstract Algebra” , KRISHNA Prakashan Media (P) Ltd.

CA 16. 208 **Electronic Commerce** **3-0-0-3**

Total Lectures:40

1. **Electronic Commerce**: Overview and Scope, Traditional Commerce vs. Electronic Commerce, Impact of E-Commerce, Electronic Markets, Internet Commerce, e-commerce in perspective, Application of E Commerce in Direct Marketing and Selling, advantages and disadvantages, and future of E-commerce. [9]

2. **Business strategy in an Electronic Age:** Value Chains, Supply chain, Porter's value chain Model, Inter Organizational value chains, Strategic Business unit chains and industry value chains. [7]

3. **Business to Business E-Commerce**: Inter-organizational Transitions, Credit Transaction Trade Cycle, a variety of transactions. Electronic Data Interchange (EDI): Introduction, Benefits of EDI, EDI Technology, EDI standards, EDI Communication, EDI Implementation, EDI agreement, EDI security. [9]

4. **Electronic Payment System:** Introduction, Online Payment System, Prepaid Electronic Payment System, Post Paid Electronic System, E-Cheques, Credit Cards, Smart Cards, E-Purses, Debit Cards, Legal Risk of E-Payment System. [8]

5. **Securing Network Transaction:** Security Policy, Procedures and Practices, Transaction Security, Cryptography Algorithm, Public Key Algorithm, Authentication Protocol, Digital Signature, E-Mail Security. [7]

Text Books:

1. Whitely David, "E-commerce Strategy, Technology and application", Tata McGraw Hill Publications, New Delhi.

Reference Books:

1 Kalakota ,R. and Whinston, A. B. "Readings in Electronic Commerce", Addison Wesley.
2 Schneider, Gary P. and Perry ,Jame, "Electronic Commerce" Thomson Publication.
3 P.T. Joseph, S.J., "E-Commerce An Indian Perspective", PHI.

CA 16. 234 **Internet Laboratory** **0-0-4-2**

UNIT I: Evaluate e-mail software and Web-based e-mail services

Testing: Mail configuration on different mail sites

Programs:

- Main features of e-mail and how it works
- Describe the Thunderbird and Opera e-mail clients
- Describe and use Web-based e-mail services
- Configure and use Outlook Express to send, receive, and print e-mail messages
- Create and maintain an address book in Outlook Express
- Configure and use Hotmail to send, receive, and print e-mail messages
- Create and maintain an address book in Hotmail

UNIT II: Use search engines and directories effectively

Testing: Web search tools **(**google, Google Scholar, DuckDuckGo**,** Metasearch engines**)**

Programs:

- Determine whether a research question is specific or exploratory
- How to formulate an effective Web search strategy to answer research questions
- Uses of Web search engines, Web directories, and Web meta search engines effectively
- Use Boolean logic and filtering techniques to improve your Web searches
- Use advanced search options in Web search engines
- Assess the validity and quality of Web research resources
- Describe the future of Web search tools

UNIT III: Use FTP and other services to transfer and store data

Testing: File Transfer Protocol

Programs:

- Describe what FTP is and how it works
- Demonstrate how to use an FTP client program and Web browser to transfer files
- Demonstrate navigation of an FTP site using a Web browser
- Demonstrate how to compress and decompress files and how to check them for viruses
- Download an FTP client program using a Web browser
- Install and use a compression program
- Trace the connection between your computer and a remote computer

UNIT IV: Important features of electronic commerce

Testing: E-Business

Programs:

- Important sites that conduct electronic commerce
- Basics of electronic commerce
- How companies generate revenues online
- Companies reduce costs and improve operational efficiency using Internet technologies
- New ways of doing business on the Web such as online auctions etc.
- International, legal, and ethical concerns for electronic commerce

CA 16. 210 **Java Programming** **3-1-0-4**

Total Lecture:40

1. **Basic Concepts:** Importance of Java, Java Byte code, Java and HTML, the Java buzzwords, using blocks of code, lexical issues, Java Class Libraries. [4]
2. **Java Programming:** Constants, Variables, Data Types, Operators, Type Conversion in Expression, Mathematical Functions, Decision Control Structure, Loop Control Structure, Arrays. [8]
3. **Classes:** Class fundamentals, declaring objects, assigning object reference variables, introducing methods, constructors, the this keyword, garbage collection, the finalize () method, overloading methods, using objects as parameters, returning objects, recursion, introducing access control, understanding static, introducing final, arrays revisited, introducing nested and inner classes, exploring the string class, using command-line arguments, Vector, Wrapper Classes. [5]
4. **I/O and String Handling:** I/O basics, reading console input, writing console output, the PrintWriter class, reading and writing files, string constructors, string length, special string operations, character extraction, string comparison, searching strings, modifying a string, data conversion using valueOf (), changing the case of characters within a string, StringBuffer. [6]
5. **Inheritance:** Inheritance basics, using super, create a multilevel hierarchy, constructors, method overriding, dynamic method dispatch, abstract classes, final with inheritance, object class. [5]
6. **Package, Interfaces and Exception Handling:** Packages, access protection, importing packages, interfaces, exception-handling fundamentals, exception types, uncaught exceptions, using try and catch, multiple catch clauses, nested try statements, throw, throws, finally, Java's built-in exceptions, creating your own exception subclasses, using exceptions. [7]
7. **Applet Programming:** Applet life cycle, Creating executable application, Designing a web page, Applet Tag, Parameter passing in applets, Graphic Class, lines, rectangles, circle and ellipse, polygons. [5]

Text Books

1. Herbertz Shildt ,"Java The Complete Reference,", 7th ed.,TMH, New Delhi
2. Balagurusamy E, "Programming With Java " , TMH, New Delhi

Reference Books

1. Borror A. B., "Object-Oriented Programming with Java-an ultimate Tutorial", Dreamtech Press, 2000.
2. Budd T., "Understanding Object-Oriented Programming with Java", Pearson Education Asia, 2001.
3. Arnold K., Gosling J. and Holmes D., "The Java Programming Language", Addision-Wesley, 3rd ed., 2000.

CA 16.236 Java Programming Laboratory 0-0-4-2

1. Introduction

Testing

- Data Types & Operators
- Control Statements
- Arrays

Programs

- Apply logic to print different patterns(at least 3)
- Programs like to print Fibonacci series, check whether a number is prime or not
- Max and min of a given list of numbers, their sum and average
- Result of a student using switch-case
- Implementing matrix operations
- Searching and Sorting

2. Classes, Object & Inheritance

Testing

- Objects and reference variables
- Constructors and parameterized constructors
- this, static, command line arguments
- Inheritance, overloading and overriding
- super, abstract classes and Dynamic method dispatch

Programs

- Write a program to illustrate super .
- Show method overloading to calculate the area of different shapes.
- Manipulate the above program to illustrate run time polymorphism.

3. I/O and String Handling

Testing

- Reading console input and writing console output
- BufferedReader class and PrintWriter class
- String operations and comparisons

Program

- Write a program to print the last characters of all the strings given from command line
- Change the case of characters within a string.
- Write an applet to print "HELLO"**.**

4. Package, Interfaces and Exception Handling

Testing

- importing packages
- interfaces and multiple inheritance
- exception-handling fundamentals
- built-in exceptions and creating one's own exception subclasses

Programs

- Write and execute a program which is inside a package "MyPacK".
- Write a program which imports a package.
- Write a program in which implements the concept of multiple inheritance.
- Write a program that handles two Exceptions, each at different run.

- Write a program in which an user defined exception is created.

5. Applet

Testing

- Applet Life Cycle
- Applet tag

Programs

- Write an applet to print “HELLO”**.**
- Write an applet to print different shapes.
- Write an applet to which works according to values passed through html page.

CA 16. 205 **Management Information System** **3-0-0-3**

Total Lectures:40

1. **Introduction:** Elements, characteristics, objectives and importance, relationship between MIS and Computer, role of MIS in the functions of management. [7]

2. **Information Concept:** Classification of information, levels of information, techniques of data collection, quality aspect of information, value of Information. [7]

3. **Decision Making:** Decision making concepts, rationality in decision making, decision support system, MIS as a technique for programmed decisions, structured Vs Un-structured decisions, formal vs. informal systems, model of decision making, methods, MIS and role of decision making. [8]

4. **Manager and Computers:** Database concept, database models, database design, RDBMS, MIS and RDBMS, network topology, LAN, MAN, WAN and data communication. [6]

5. **Development of MIS:** Strategic and project planning for MIS, conceptual system design, detailed design, implementation, evaluation and maintenance of the MIS, pitfalls of MIS. [6]

6. **Applications of MIS:** MIS for marketing, financial, production management, human resource management. [6]

Text Books:

1. Jawadekar,W. S. "Management Information System", Tata McGraw- Hill Publishing Co. Ltd., New Delhi

Reference Books:

1 Murdick, R, G, Ross J E and Clagget, J,R, "Information Systems for Modern Management", PHI, New Delhi

2 Sadagopan, "Management Information System", PHI, New Delhi.

3 Parker, Case Thomas, "Management Information System: Strategies and Action", Tata McGraw- Hill Publishing Co. Ltd., New Delhi

CA 16. 364 **Artificial Intelligence** **3-0-0-3**

Total Lectures: 40

1. **Overview of A.I.:** Introduction to AI, Importance of AI, AI and its related field, AI techniques.

[4]

2. **Problem space and search**: Defining the problem as a state space search, Production system and its characteristics, Issues in the design of the search problem.

[5]

3. **Heuristic search techniques** : Generate and test, hill climbing, best first search technique, problem reduction, constraint satisfaction

[6]

4. **Game Playing** : Minimax , alpha-beta pruning.

[4]

5. **Predicate logic**: Definition, representation of simple facts in logic, well formed formula, resolution.

[8]

6. **Knowledge representation**: Definition and importance of knowledge, Knowledge representation, Various approaches used in knowledge representation, Issues in knowledge representation.

[8]

7. **Learning:** Introduction learning, Types of learning, Introduction to neural networks.

[5]

Text Book:

1. Rich Elaine and Knight Kevin , Artificial Intelligence, Tata McGraw – Hill, 3rd edition, 2012

Reference Books:

1. Russell Stuart and Norvig Peter, Artificial Intelligence: A Modern Approach, Prentice Hall; 3 edition,2009

2. Patterson D.W., "Introduction to AI and Expert Systems", PHI, 1999

CA 16. 375 **Bioinformatics** **3-0-0-3**

Total Lectures:40

1. **Introduction to Networking:** Definition and scope of networking, Basic network topology, Concept of LAN, MAN and WAN, Introduction to Internet and data transfer protocol (TCPI/P, FTP) [5]

2. **Biological Information Resources:** Introduction to biological data and database management, Biological databases – Protein databanks (Primary and Secondary databank; Sequence and structure databank), Genomic databanks (Sequence and specialized databanks). [5]

3. **Sequence Alignment:** Introduction to biological sequence alignment, Database searching, Algorithm for sequence alignment, Pairwise alignment (Needleman and Wunsch algorithm, Smith-Waterman algorithm), Multiple Sequence Alignment, Concept of Gaps, Gap penalties and scoring matrices. [7]

4. **Tools for Sequence Alignment:** FASTA, BLAST, Variations of BLAST, Alignment scores and statistical significance of database searches. [8]

5. **Genomics:** Genome, Gene structure of prokayotes and eukaryotes, Concept of ORFs, GC-content, Codon Usage, cDNAs and ESTs, Serial analysis of gene expression (Microarrays). [9]

6. **Proteomics:** Introduction to proteome and proteome analysis (2D electrophoresis, Mass spectrophotometry, Protein microarray and X-ray crystallography), Algorithm for modeling protein folding. [6]

7. **Phylogenetics:** Introduction to phylogenetics, Parsimony, Molecular phylogenetics, Methods of phylogenetic tree construction

Text Books:

1. Peruski and Peruski: The Internet and the new Biology: tools for Genomic and Molecular Research, ASM Publishing House, India.

Reference Books:

2 Higgins and Taylor, Bioinformatics, Oxford University Press, US.

CA 16. 379 **Cloud Computing** **3-0-0-3**

Total Lectures:40

1. **Introduction:** System models for advanced computing –clusters of cooperative computing, grid computing and cloud computing; software systems for advanced computing-service oriented software and parallel and distributed programming models with introductory details, Features of cloud platform. [8]
2. **Services and Model:** Cloud Computing services models and features in Saas, Paas and Iaas. Service oriented architecture and web services; Features of cloud computing architectures and simple case studies. [7]
3. **Virtualization:** Characteristic features, Taxonomy Hypervisor, Virtualization and Cloud Computing, Pros and Cons of Cloud Computing, Technology Examples/Case Studies. [6]
4. **Cloud programming:** Map Reduce Hadoop Library from Apache, Open Source Cloud Software Systems Eucalyptus. [8]
5. **Architecture:** Cloud Architecture and Service modeling, Cloud resource management, Cloud Application trends. [5]
6. **Cloud and SOA :** SOA journey to infrastructure, SOA and cloud, SOA defined, SOA defined, SOA and IAAS, SOA based cloud infrastructure steps, SOA business and IT services. [6]

Text Books:

1. Kaittwang Geoffrey C.Fox and Jack J Dongrra "Distributed and Cloud Computing", , Elsevier India 2012.

2. Buyya Raj Kumar, Vecchiola Christian and Selvi S.Tanurai ,"Mastering Cloud Computing", TMH, 2012.

Reference Books:

1. Ritting John W. House and Ramsome James F "Cloud Computing", , CRC Press, 2012.

2. Shroff Gautam "Enterprise Cloud Computing", , Cambridge University Press, 2012.

CA 16. 368 **Cyber Law** **3-0-0-3**

Total Lectures:40

1. **Fundamentals of Cyber Law**: Jurisprudence of Cyber Law- Overview of Computer and Web Technology- Introduction to Indian Cyber Law- Overview of General Laws and Procedures in India; Freedom of Expression on the Internet. [10]

2. **E-commerce-Legal Issues:** Electronic Commerce –Digital Signature- Meaning; Creation of Digital Signature; Understanding how digital signatures work, Role in Information Technology; technical issues; legal issues; Crimes relating to digital signature certificates. [10]

3. **Cyber Crimes:** Meaning of Cyber Crimes –Cyber crimes under IPC, Cr.P.C and Indian Evidence Law - Cyber crimes under the Information Technology Act,2000 - Cyber crimes under International Law - Hacking Child Pornography, Cyber Stalking, Denial of service Attack, Virus Dissemination, Software Piracy, Internet Relay Chat (IRC) Crime, Credit Card Fraud, Net Extortion, Phishing etc - Cyber Terrorism - Violation of Privacy on Internet - Data Protection and Privacy ;Concept of Social Networking – Legal Implications of Social Networking [12]

4. **Intellectual Property Issues and Cyberspace : The Indian Perspective;** Overview of Intellectual Property related Legislation-Copyright law & Cyberspace; Trademark law & Cyberspace; Law relating to Semiconductor Layout & Design. [8]

Text Books:

1. Rodney D. Ryder, Guide to Cyber Laws, 2nd Edit, Wadhwa and Company, Nagpur
2. Sharma,Vakul. Information Technology law and Practice. Universal law Publishing,2011
3. Rattan, Jyoti. Cyber law. New Delhi: Bharat law House,2011.

Reference Books:

1 Seth,Kanika. Cyber Law in the Information Technology Act. Nagpur : Lexis Nexis Butterworth Wadhwa,2009
2. Rodney D.Ryder,Guide of Cyber Law,2nd Edition.
3. Faruq Ahmed,Cyber law in India.

CA 16. 369 **E-Business** **3-0-0-3**

Total Lectures:40

1. **Internet as a Business Driver:** Internet, WWW, Benefits of Internet and WWW, Difference between e-Commerce and e-Business, Mobile Internet, Internet Consumers. [8]
2. **Introduction to e-Business Trends:** Trends Driving e-Business, Customer Oriented Trends, e-Service Trends, Organizational Trends, Enterprise Technology Trends and General Technology Trends. [7]
3. **E-Business Models:** Disruptive Technology, e-Business Models, Internet Pricing, e-Cash, Online Retailing, Constructing e-Business ICT Framework. [10]
4. **Leveraging the Web for Marketing:** Business Enhancement, Framework for Web Marketing, Web Usability, Content Management, and Impact of Internet on Marketing. [9]
5. **Online Resources and Deployment:** Meta Search Engines, Boolean Searching on Internet, Best Practice Web Searching, The Invisible Web, [6]

Text Books:

1.Ravi Kalakota, Marcia Robinsion, "E-Business 2.0: Roadmap For Success", 2nd Edition, Pearson.
2.Paul Phillips, "E-Business Strategy", 1st edition, TMH.

Reference Books:

1.Colin Combe, "Introduction to e-Business", 1st Edition, Routledge
2.Azhar Kozami**, "**Business Policy and Strategic Management", 2nd Edition, Tata McGraw Hill.

CA 16. 377 **Geographical Information System** **3-0-0-3**

Total Lectures:40

1. **Genesis and Progression:** Basic Concepts, Benefits of Computerization of Information, Users of GIS, Introduction to Real World and Data Model, Geometric Representation of objects, Levels of Measurement, Applications of GIS. [8]
2. **Vector Data Models:** Introduction, Spaghetti Model, Topology Model, Data Compression, Storing Vector Data. [7]
3. **Raster Data Models:** Necessity and Characteristics, Coding and Storage of Raster Data, Compression of Raster Data, Run Length Encoding, Chain Codes, Block Codes, Quad Tree Model, Conversion and Contrast between Vector and Raster Models. [10]
4. **Hardware and Software Requirements for GIS:** Basic Hardware Devices viz Computer, VDU, Quantizers, Printers, Plotters, etc. DBMS, Structure of Databases, Multimedia, WWW. [9]
5. **Basics of Data Collection:** Digitizing Maps, Scanning, Manual Digitizing, Arial Photographs, Photo Interpretation, Remote Sensing, Correction, Surveying. [6]

Text Books:

1. Bernhardsen Tor, "Geographic Information System: An Introduction", 3rd edition, Wiley Publication.
2. Longley Paul, "Geographic Information Systems and Science", 2nd Edition, Wiley Publication.

Reference Books:

1 Bjarne Stroustrup ,"Programming -Principles and Practice Using C++", Addison-Wesley.

2 Herbert Schildt , "C++: The Complete Reference", 4th edition, TMH.

CA 16. 366 **Information Security** **3-0-0-3**

Total Lectures: 40

1.Introduction: Information, Characteristics of Information, Security Attacks, NSTISSC security model, Concepts of Policies; procedures; Guidelines and Standards. [8]

2.Cryptography: Conventional Encryption Principles, Conventional encryption algorithms, cipher block modes of operation, location of encryption devices, Public key cryptography principles, public key cryptography algorithms, digital signatures, digital Certificates. [10]

3.IP Security: IP Security Overview, Architecture, Authentication Header, Encapsulation Security Payload, Combining Security Association, Key Management, Pretty Good Privacy, S/Mime and Types. [7]

4.Web Security and E-Commerce: Web Security Requirement, SSL and Transport Layer Security, Secure Electronic Transactions, Introduction to E-Commerce, Transactions on E-Commerce, Requirement of Security on E-Commerce. [7]

5. System Security: Recognized Security Threats, Virus, Trojan horse, Worm, Spyware, Adware, Key Logger, Denial of Services, Firewall Design Principles, Trusted Systems, Common criteria for information technology security and evaluation. [8]

Text Book:

1. William Stallings ,"Cryptography and Network Principles and Practice", Fourth Edition, , Pearson.

2. William Stallings, "Network Security Essentials (Applications and Standards)" Pearson.

Reference Books:

1. Forouzan, Mukhopadhyay ,"Cryptography & Network Security", , McGrawHill
2. Godbole "Information Systems Security", , Wiley-India
3. Shah Deven "Information Security Principles and Practice", , Wiley-India

CA 16.365 **Internet Technologies** **3-0-0-3**

Total Lectures:40

1.	**Introduction:** Layering, TCP/IP Layering, Internet Addresses, The Domain Name System, Client Server Model, Port Numbers, Implementations and Application, Programming interfaces.	05
2.	The Link Layer Ethernet and IEEE 802 Encapsulation Trailer Encapsulation, **SLIP:** Serial Line IP, Compressed SLIP, **PPP**: Point-to-Point Protocol.	04
3.	**IP**: The Internet Protocol IP Header, IP Routing, Subnet Addressing, Subnet Mask, Special Case IP Addresses.	06
4.	**Introduction to ARP**: Address Resolution Protocol and RARP: Reverse Address Resolution Protocol, ARP Packet Format, Proxy ARP, RARP Packet Format.	07
5.	**ICMP**: Internet Control Message Protocol Introduction, ICMP, Message Types, ICMP Address, Mask Request and Reply , IP Routing Routing Principles, Introduction to Dynamic Routing; . **UDP**: User Datagram Protocol UDP Header, UDP Checksum; **DNS**: The Domain Name System DNS Basics, DNS Message Format, security.	10
6.	**TCP**: Transmission Control Protocol TCP Services, TCP Header TCP Connection, Establishment and Termination, TCP Timeout and Retransmission, Repacketization; Telnet and Rlogin Remote Login Rlogin Protocol, SMTP Protocol; **FTP**: File Transfer Protocol and SMTP: Simple Mail Transfer Protocol.	08

Text Books:

1. Tannenbaum A. S., “Computer Networks”, Prentice-Hall India., New Delhi
2. Forouzan Behrouz A, “Data Communication and Networking”, TMH, New Delhi

Reference Books:

1 Sybex ,“Networking Complete”, BPB Publication, New Delhi

2. Stallings Willam, “Data and Computer Communication”, Pearson Education, New Delhi

CA 16. 362 **Knowledge Management** **3-0-0-3**

Total Lectures:40

1. **Introduction:** Definition, Evolution, Types, Implication for Knowledge Management [6]

2. **Life Cycle:** Challenges, Difference, Knowledge management system Life Cycle, Comparative Studies Between SDLC and Knowledge Management System Development, Role of Knowledge Developer. [8]

3. **Knowledge Creation and Architecture:** Knowledge Codification, Need of Codification, and Knowledge Tools for Codification, Developer Skills Set. [9]

4. **Knowledge Transfer and Internet:** Internet and Knowledge, E-Business, Ethical and Legal Issues in Knowledge Management. [8]

5. **Executive Information and support Systems**: Business Expert System and AI, OLTO & OLAP; Data Warehousing; Data Marts, Data Warehouse architecture; Tools for data warehousing. [9]

Text Books:

1. Awad, Elias M., "Knowledge Management", TMH, New Delhi

Reference Books:

1 Inmon, W. H., "Building Data Warehousing", Wiley, New Delhi

2 Han, Jiawei, Kamber, Michelinal, "Data Mining Concepts & Techniques", Harcourt India, New Delhi

Testing:

- Flash editor and toolbox.
- Frames and key frame concepts
- Color schemes

Application programs based on above elements in different areas of computing like- Science, Business, Mathematics and other manual processes.

Testing:

- Animation using shape tween and motion tween.

Application programs based on above elements in different areas of computing like- Science, Business, Mathematics and other manual processes.

Testing:

- concept of layers
- Understanding guide ,mask layer.

Application programs based on above elements in different areas of computing like- Science, Business, Mathematics and other manual processes.

Testing:

- Animation using symbols (movie clip, graphic and buttons) and library.

Application programs based on above elements in different areas of computing like- Science, Business, Mathematics and other manual processes.

Testing:

- Animation of text morphing.

Application programs based on above elements in different areas of computing like- Science, Business, Mathematics and other manual processes.

CA 16. 304 **Multimedia Technolgy** **3-0-0-3**

Total Lectures: 40

1. **Overview** - Multimedia - Definitions, Basic properties, Temporal and non temporal medium, Multimedia applications, Uses of Multimedia, Stages of multimedia project, requirements to make good multimedia, Multimedia skills and training.

[6]

2. **Multimedia-Hardware and Software**: Production Platforms, Hardware Peripherals, Connections, Memory and Storage devices, Media software tools, Multimedia Authoring tools, Production Standards.

[8]

3. **Multimedia building blocks**: Audio, basic sound concepts, music, speech, MIDI versus digital audio, audio file formats, sound for the web, images and graphics-basic concepts, Digital video production and editing techniques, animation-basic fundamentals, Kinematics, morphing , animation s/w tools and techniques, animation for the web.

[10]

4. **Data Compression:** Need of Compression techniques, Difference of lossless/lossy compression techniques. Storage space and coding requirements, classification of coding, compression techniques-JPEG and MPEG.

[9]

5. **Multimedia and Internet:** HTML and web authoring, Multimedia considerations for Internet, Design considerations for web pages ,Web Browsers, Web page makers and editors, Media Communication, Media Consumption, Media games.

[7]

Text Book:

1. Steinmetz R., and Nahrstedt K., Multimedia - Computing, Communications and Applications, Pearson Education Asia, 2nd Ed., 2003.

References Books:

1. Buford J. F. K., Multimedia System, Addison-Wesley, 3rd Ed., 1994.
2. Vaughan T., Multimedia - Making it Work, Tata McGraw-Hill, 3rd Ed., 2002.

CA 16.367 **Network Security** **3-0-0-3**

Total Lectures:40

1 **Introduction:** Attacks, Services and Mechanisms, Security Attacks, Security Services, Integrity check, digital Signature, authentication, has algorithms. [3]

2 **Secret Key Cryptography:** Block Encryption, DES rounds, S-Boxes IDEA: Overview, comparison with DES, Key expansion, IDEA rounds, Uses of Secret key Cryptography; ECB, CBC, OFB, CFB, Multiple encryptions DES. [8]

3 **Hash Functions and Message Digests:** Length of hash, uses, algorithms (MD2, MD4, MD5, SHS) MD2: Algorithm (Padding, checksum, passes.) MD4 and 5: algorithm (padding, stages, digest computation.) SHS: Overview, padding, stages. [7]

4 **Public key Cryptography:** Algorithms, examples, Modular arithmetic (addition, multiplication, inverse, and exponentiation) RSA: generating keys, encryption and decryption. Other Algorithms: PKCS, Diffie-Hellman, El-Gamal signatures, DSS, Zero-knowledge signatures [7]

5 **Authentication:** Password Based, Address Based, Cryptographic Authentication. Passwords in distributed systems, on-line vs offline guessing, storing. Cryptographic Authentication: passwords as keys, protocols, KDC's Certification Revocation, Interdomain, groups, delegation. Authentication of People: Verification techniques, passwords, length of passwords, password distribution, smart cards, biometrics. [6]

6 **Example System:** Kerberos: purpose, authentication, serer and ticket granting server, keys and tickets, use of AS and TGS, replicated servers. Kerberos V4: names, inter-realm authentication, Key version numbers. Kerberos V5: names, realms, delegation, forwarding and proxies, ticket lifetimes, revoking tickets, multiple Realms. [4]

7. **Network Security:** Electronic mail security, IP security, Network management security. Security for electronic commerce: SSL, SET. System Security: Intruders and Viruses, Firewalls, Intrusion Detection. [4]

Text Books:

1. Atul Kahate," Cryptography and Network Security", TMH, New Delhi

2. Kaufman, C., Perlman, R., and Speciner, M., "Network Security, Private Communication in a public world" , PHI.

Reference Books:

1 Stallings, W., "Cryptography and Network Security: Principles and Practice", Prentice Hall.

2. Stallings, W., "Network security Essentials: Applications and standards", Prentice Hall.

3. Behrouz A Forouzan, "Cryptography and Network Security"; McGraw Hill;.

CA 16. 373 **Software and CASE Tools** **3-0-0-3**

Total Lectures:40

1. **Software Engineering Fundamentals :** Definition of software product and process, Software Characteristics, Components, Applications, Layered Technologies, Processes and Product, Methods and Tools, Generic View of Software Engineering, Software Crisis and Software development paradigms, [5]
2. **Software Requirements Analysis & Specification:** System specification, Software requirements specification (SRS) standards, Analysis Modeling: Difference between Data and Information, ER Diagram, Dataflow Model, Control Flow Model, Control and Process Specification, Data Dictionary [8]
3. **Software Design:** Software architecture, Modular design - cohesion and coupling, Process-oriented design, Data-oriented design, User-interface design, Real-time software design, introduction to Object Oriented Design. [7]
4. **CASE Tools, Coding and Testing** Computer-aided software engineering, Introduction to CASE, Building Blocks of CASE, Integrated Case Environment, Characteristics of good Programming languages, Introduction to Testing Process, Testing Activities like Unit, Integration & System Testing. [7]
5. **Software Reengineering:** Business Process Reengineering, Reverse Engineering, Software re-engineerin.. [5]
6. **Software Quality and Metrics:** SQA-Software Quality Assurance, Software Reliability, Software quality metrics, SQA plan, ISO 9000 and 9001 Quality Standards. [8]

Text Books:

1. Pressman R.S. , "Software Engineering", TMH.
2. Rumbaugh James ,Object Oriented Modeling and Design, Prentice Hall- Gale
3. The Unified Modeling Language User Guide - Grady Booch, James Rumbaugh, Ivar Jacobson.

Reference Books:

1 Pankaj Jalote,"An Integrated Approach to Software Engineering", NAROSA.
2 Designing Flexible Object Oriented systems with UML - Charles Ritcher
3 Fairely, R.E., "Software Engineering Concepts", McGraw-Hill
4 Object-Oriented Analysis and Design: using UML Mike O'Docherty Wiley Publication

CA 16. 303 **Software Engineering** **3-0-0-3**

Total Lectures:40

1. **Introduction:** Software Characteristics, Components and Applications, Software Engineering a layered Technology, Software life cycle models, Waterfall, Prototype, Evolutionary and Spiral Models. [8]

2. **Software Project Management:** Basic Concepts, Project Management: Core functions, support functions, Project Integration Management. [8]

3. **Software Project Planning:** Objectives, decomposition techniques: software sizing, problem based estimation, lines of code based estimation, and function point based estimation, process based estimation, Cost Estimation Models:- COCOMO, Risk Management. [8]

4. **Software Design:** Design Principles, Design Concepts:- abstraction, refinement, modularity, software architecture, structured partitioning, information hiding**,** effective Modular Design:- functional independence, cohesion and coupling, Object Oriented analysis and Design. [8]

5. **Software Testing:** Testing Fundamentals, Design of Test Cases, White box testing, Basis Path testing, Control structure Testing, Black box testing. [8]

Text Books:

1. Pressman R.S., "Software Engineering", Tata McGraw Hill Publishing Company Ltd., New Delhi.

Reference Books:

1 Jalote Pankaj,"An Integrated Approach to Software Engineering", NAROSA.
2 Sommerville, Ian "Software Engineering", Pearson Education
3 Fairely, R.E., "Software Engineering Concepts", McGraw-Hill

CA 16. 363 **System Software** **3-0-0-3**

Total Lectures:40

1. **Overview:** Language processors, data structures for language processors, assemblers, macros and macro processors, compilers, interpreters, linkers and loaders. [5]

2. **Operating System:** Functions of Operating System, Kernel, Shell, Process, Process state diagram, System Calls. [5]

3. **Assemblers:** Design of an assembler ,one pass and two pass Assembler, Databases of Assemblers, table processing [7]

4. **Macro Processors:** Importance of Macro, Macro Definition, Macro call, Macro Expansion, Conditional Macro expansion, Nesting of Macros, Functions of Macro Processor . [8]

5. **Loaders and Linkers:** Function of Loaders, loader schemes - compile and go, general, absolute, subroutine linkages, relocating loaders, direct linking loaders, binders, linking loaders, overlays, dynamic binders. [9]

6. **Compilers :** Types of Compilers, Phases of compiler design, recursion, call and return statements. [6]

Text Books:

1. Donovan J.J., "Systems Programming", New York, Mc-Graw Hill, 1972.

Reference Books:

1 Leland L Beck,"System Software, An Introduction to System Programming", Pearson Education, 13th Indian Reprint, New Delhi, 2003.

2 Dhamdhere, D.M., "Introduction to Systems Software", Tata Mc-Graw Hill 1996.

Testing:

- Markup Tags
- Formatting Tags
- Frames
- Form Elements

Programs:

- Design web pages based on above Tags.
- Design and formatting a form based on form elements

Testing:

- Cascading Style sheets
- Dragging
- Dropping
- Div tag.

Programs:

- Based on above CSS formatting on HTML scripts.

Testing:

- java Script Declaration and Expressions
- Control Structure and Functions
- Java Script: Properties and Methods
- Array Object
- Date Object
- Math Object
- String Object
- Events in java Script: Onblur, Onclick, on change, on focus.

Programs:

- Form validation through JavaScript
- Program for Event handling
- Working with Date and Time Functions
- Program for calculator

Testing:

- VBScripts String
- Date and Time
- Arrays
- control Structure
- Looping
- Methods and events
- data validation

Programs:

- Form validation through VBScript
- Program for Event handling
- Working with Date and Time Functions

Testing:

- XML components
- DTD
- Creating a Valid Document From a DTD

Programs:

- Basic XML Document
- Access XML document elements through programs

CA 16.301 **Web Technology** **3-0-0-3**

Total Lectures:40

1. **Introduction:** Clients, Servers, and Communication, The Internet Basic Internet Protocols, The World Wide Web, HTTP request message, response message, Web Clients Web Servers. [5]

2. **HTML:** HTML Document, Markup Tags (HTML, HEAD, TITLE, BODY, PRE, LIST, HR, BR), Formatting Tags (MARQUEE, BOLD, ITALICS, SUBSCRIPT), Linking, URL, Relative Path Vs Absolute Path names, Images, Tables, Frames, Form Elements (Text, Buttons, List, Reset, Submit, Radio buttons, Checkbox); DHTML: Cascading Style sheets, Dragging, Dropping, Layers, Div tag. [8]

3. **JavaScript:** Declaration and Expressions, Control Structure and Functions, Variable scope Global Vs Local, Object in Java Script: Properties and Methods, Array Object, Date Object, Math Object, String Object, Events in java Script: Onblur, Onclick, on change, on focus, Design of Interactive forms; [9]

4. **VBScript:** Fundamentals, Variables, String, Constant, Date and Time, Arrays, control Structure, Design making, looping, Sub procedure, Object Methods and events, data validation. [7]

5. **XML:** Overview, Comparison of XML and html, components of XML, XML document, XML declaration, Root element, An empty element, attributes, Markup Delimiters, Element Mark Up, Attribute Mark Up, Naming Rules, Character References, Predefined Entities, Entity References, Cdata Sections, Processing Instructions, Document Type Declaration, Welformed and Valid Document, DTD and Validation, Internal DTD Subset, External DTD, Developing DTD, Elements and Attributes Of DTDs:- Empty Element, Only Element, Mixed Elements, Any Element, Creating a valid document from a DTD. [11]

Text Books:

1. Young M .L, " Internet Millenum Edition" TMH, New Delhi.
2. Jackson Jeffrey C., "Web Technologies -A Computer Science Perspective", Pearson Education, 2006.

Suggested Reading

1. Noel Jerkr, " Techunedia VB Scraper VB Script Interleave course", New Delhi 1998
2. Marlin Webb, "Java Scraper, Instant JavaScript", Tata McGraw-Hill, New Delhi.
3. Eathier Kay and Houser Alan **,** **"**XML programming in 2 ½ days," IDG Books India (P) Ltd.

CA 17. 208 **Electronic Commerce** **3-1-0-4**

Total Lectures:40

1. **Electronic Commerce**: Overview and Scope, Traditional Commerce vs. Electronic Commerce, Impact of E-Commerce, Electronic Markets, Internet Commerce, e-commerce in perspective, Application of E Commerce in Direct Marketing and Selling, advantages and disadvantages, and future of E-commerce. [7]

2. **Business strategy in an Electronic Age:** Value Chains, Supply chain, Porter's value chain Model, Inter Organizational value chains, Strategic Business unit chains and industry value chains. [6]

3. **Business to Business E-Commerce**: Inter-organizational Transitions, Credit Transaction Trade Cycle, a variety of transactions. Electronic Data Interchange (EDI): Introduction, Benefits of EDI, EDI Technology, EDI standards, EDI Communication, EDI Implementation, EDI agreement, EDI security. [7]

4. **Electronic Payment System:** Introduction, Online Payment System, Prepaid Electronic Payment System, Post Paid Electronic System, E-Cheques, Credit Cards, Smart Cards, E-Purses, Debit Cards, Legal Risk of E-Payment System. [8]

5. **Securing Network Transaction:** Security Policy, Procedures and Practices, Transaction Security, Cryptography Algorithm, Public Key Algorithm, Authentication Protocol, Digital Signature, E-Mail Security.

6. **Case Study:** Different case studies of E commerce [5]

CA 17. 364 **Artificial Intelligence** **3-1-0-4**

Total Lectures: 40

1. **Overview of A.I.:** Introduction to AI, Importance of AI, AI and its related field, AI techniques.

[4]

2. **Problem space and search**: Defining the problem as a state space search, Production system and its characteristics, Issues in the design of the search problem.

[5]

3. **Heuristic search techniques** : Generate and test, hill climbing, best first search technique, problem reduction, constraint satisfaction

[6]

4. **Game Playing** : Minimax , alpha-beta pruning.

[4]

5. **Predicate logic**: Definition, representation of simple facts in logic, well formed formula, resolution.

[8]

6. **Knowledge representation**: Definition and importance of knowledge, Knowledge representation, Various approaches used in knowledge representation, Issues in knowledge representation.

[8]

7. **Learning:** Introduction learning, Types of learning, Introduction to neural networks.

[5]

Text Book:

1. Rich Elaine and Knight Kevin , Artificial Intelligence, Tata McGraw – Hill, 3rd edition, 2012

Reference Books:

1. Russell Stuart and Norvig Peter, Artificial Intelligence: A Modern Approach, Prentice Hall; 3 edition,2009

2. Patterson D.W., "Introduction to AI and Expert Systems", PHI, 1999

CA 17. 375 **Bioinformatics** **3-1-0-4**

Total Lectures:40

1. **Introduction to Networking:** Definition and scope of networking, Basic network topology, Concept of LAN, MAN and WAN, Introduction to Internet and data transfer protocol (TCPI/P, FTP) [5]

2. **Biological Information Resources:** Introduction to biological data and database management, Biological databases – Protein databanks (Primary and Secondary databank; Sequence and structure databank), Genomic databanks (Sequence and specialized databanks). [5]

3. **Sequence Alignment:** Introduction to biological sequence alignment, Database searching, Algorithm for sequence alignment, Pairwise alignment (Needleman and Wunsch algorithm, Smith-Waterman algorithm), Multiple Sequence Alignment, Concept of Gaps, Gap penalties and scoring matrices. [7]

4. **Tools for Sequence Alignment:** FASTA, BLAST, Variations of BLAST, Alignment scores and statistical significance of database searches. [8]

5. **Genomics:** Genome, Gene structure of prokayotes and eukaryotes, Concept of ORFs, GC-content, Codon Usage, cDNAs and ESTs, Serial analysis of gene expression (Microarrays). [9]

6. **Proteomics:** Introduction to proteome and proteome analysis (2D electrophoresis, Mass spectrophotometry, Protein microarray and X-ray crystallography), Algorithm for modeling protein folding. [6]

7. **Phylogenetics:** Introduction to phylogenetics, Parsimony, Molecular phylogenetics, Methods of phylogenetic tree construction

Text Books:

1. Peruski and Peruski: The Internet and the new Biology: tools for Genomic and Molecular Research, ASM Publishing House, India.

Reference Books:

2 Higgins and Taylor, Bioinformatics, Oxford University Press, US.

CA 17. 368 **Cyber Law** **3-1-0-4**

Total Lectures:40

1. **Fundamentals of Cyber Law**: Jurisprudence of Cyber Law- Overview of Computer and Web Technology- Introduction to Indian Cyber Law- Overview of General Laws and Procedures in India; Freedom of Expression on the Internet. [10]

2. **E-commerce-Legal Issues:** Electronic Commerce –Digital Signature- Meaning; Creation of Digital Signature; Understanding how digital signatures work, Role in Information Technology; technical issues; legal issues; Crimes relating to digital signature certificates. [10]

3. **Cyber Crimes:** Meaning of Cyber Crimes –Cyber crimes under IPC, Cr.P.C and Indian Evidence Law - Cyber crimes under the Information Technology Act,2000 - Cyber crimes under International Law - Hacking Child Pornography, Cyber Stalking, Denial of service Attack, Virus Dissemination, Software Piracy, Internet Relay Chat (IRC) Crime, Credit Card Fraud, Net Extortion, Phishing etc - Cyber Terrorism - Violation of Privacy on Internet - Data Protection and Privacy ;Concept of Social Networking – Legal Implications of Social Networking [12]

4. **Intellectual Property Issues and Cyberspace : The Indian Perspective;** Overview of Intellectual Property related Legislation-Copyright law & Cyberspace; Trademark law & Cyberspace; Law relating to Semiconductor Layout & Design. [8]

Text Books:

1. Rodney D. Ryder, Guide to Cyber Laws, 2nd Edit, Wadhwa and Company, Nagpur
2. Sharma,Vakul. Information Technology law and Practice. Universal law Publishing,2011
3. Rattan, Jyoti. Cyber law. New Delhi: Bharat law House,2011.

Reference Books:

1 Seth,Kanika. Cyber Law in the Information Technology Act. Nagpur : Lexis Nexis Butterworth Wadhwa,2009
2. Rodney D.Ryder,Guide of Cyber Law,2nd Edition.
3. Faruq Ahmed,Cyber law in India.

CA 17. 369 **E-Business** **3-1-0-4**

Total Lectures:40

1. **Internet as a Business Driver:** Internet, WWW, Benefits of Internet and WWW, Difference between e-Commerce and e-Business, Mobile Internet, Internet Consumers. [8]
2. **Introduction to e-Business Trends:** Trends Driving e-Business, Customer Oriented Trends, e-Service Trends, Organizational Trends, Enterprise Technology Trends and General Technology Trends. [7]
3. **E-Business Models:** Disruptive Technology, e-Business Models, Internet Pricing, e-Cash, Online Retailing, Constructing e-Business ICT Framework. [10]
4. **Leveraging the Web for Marketing:** Business Enhancement, Framework for Web Marketing, Web Usability, Content Management, and Impact of Internet on Marketing. [9]
5. **Online Resources and Deployment:** Meta Search Engines, Boolean Searching on Internet, Best Practice Web Searching, The Invisible Web, [6]

Text Books:

1.Ravi Kalakota, Marcia Robinsion, "E-Business 2.0: Roadmap For Success", 2nd Edition, Pearson.
2.Paul Phillips, "E-Business Strategy", 1st edition, TMH.

Reference Books:

1.Colin Combe, "Introduction to e-Business", 1st Edition, Routledge
2.Azhar Kozami**, "**Business Policy and Strategic Management", 2nd Edition, Tata McGraw Hill.

CA 17. 377 Geographical Information System 3-1-0-4

Total Lectures:40

1. **Genesis and Progression:** Basic Concepts, Benefits of Computerization of Information, Users of GIS, Introduction to Real World and Data Model, Geometric Representation of objects, Levels of Measurement, Applications of GIS. [8]
2. **Vector Data Models:** Introduction, Spaghetti Model, Topology Model, Data Compression, Storing Vector Data. [7]
3. **Raster Data Models:** Necessity and Characteristics, Coding and Storage of Raster Data, Compression of Raster Data, Run Length Encoding, Chain Codes, Block Codes, Quad Tree Model, Conversion and Contrast between Vector and Raster Models. [10]
4. **Hardware and Software Requirements for GIS:** Basic Hardware Devices viz Computer, VDU, Quantizers, Printers, Plotters, etc. DBMS, Structure of Databases, Multimedia, WWW. [9]
5. **Basics of Data Collection:** Digitizing Maps, Scanning, Manual Digitizing, Arial Photographs, Photo Interpretation, Remote Sensing, Correction, Surveying. [6]

Text Books:

1. Bernhardsen Tor, "Geographic Information System: An Introduction", 3rd edition, Wiley Publication.
2. Longley Paul, "Geographic Information Systems and Science", 2nd Edition, Wiley Publication.

Reference Books:

1 Bjarne Stroustrup ,"Programming -Principles and Practice Using C++", Addison-Wesley.

2 Herbert Schildt , "C++: The Complete Reference", 4th edition, TMH.

CA 17. 366 **Information Security** **3-1-0-4**

Total Lectures: 40

1.Introduction: Information, Characteristics of Information, Security Attacks, NSTISSC security model, Concepts of Policies; procedures; Guidelines and Standards. [8]

2.Cryptography: Conventional Encryption Principles, Conventional encryption algorithms, cipher block modes of operation, location of encryption devices, Public key cryptography principles, public key cryptography algorithms, digital signatures, digital Certificates. [10]

3.IP Security: IP Security Overview, Architecture, Authentication Header, Encapsulation Security Payload, Combining Security Association, Key Management, Pretty Good Privacy, S/Mime and Types. [7]

4.Web Security and E-Commerce: Web Security Requirement, SSL and Transport Layer Security, Secure Electronic Transactions, Introduction to E-Commerce, Transactions on E-Commerce, Requirement of Security on E-Commerce. [7]

5. System Security: Recognized Security Threats, Virus, Trojan horse, Worm, Spyware, Adware, Key Logger, Denial of Services, Firewall Design Principles, Trusted Systems, Common criteria for information technology security and evaluation. [8]

Text Book:

1. William Stallings ,"Cryptography and Network Principles and Practice", Fourth Edition, , Pearson.

2. William Stallings, "Network Security Essentials (Applications and Standards)" Pearson.

Reference Books:

1. Forouzan, Mukhopadhyay ,"Cryptography & Network Security", , McGrawHill
2. Godbole "Information Systems Security", , Wiley-India
3. Shah Deven "Information Security Principles and Practice", , Wiley-India

CA 17.365 **Internet Technologies** **3-1-0-4**

Total Lectures:40

1.	**Introduction:** Layering, TCP/IP Layering, Internet Addresses, The Domain Name System, Client Server Model, Port Numbers, Implementations and Application, Programming interfaces.	05
2.	The Link Layer Ethernet and IEEE 802 Encapsulation Trailer Encapsulation, **SLIP:** Serial Line IP, Compressed SLIP, **PPP**: Point-to-Point Protocol.	04
3.	**IP**: The Internet Protocol IP Header, IP Routing, Subnet Addressing, Subnet Mask, Special Case IP Addresses.	06
4.	**Introduction to ARP**: Address Resolution Protocol and RARP: Reverse Address Resolution Protocol, ARP Packet Format, Proxy ARP, RARP Packet Format.	07
5.	**ICMP**: Internet Control Message Protocol Introduction, ICMP, Message Types, ICMP Address, Mask Request and Reply , IP Routing Routing Principles, Introduction to Dynamic Routing; . **UDP**: User Datagram Protocol UDP Header, UDP Checksum; **DNS**: The Domain Name System DNS Basics, DNS Message Format, security.	10
6.	**TCP**: Transmission Control Protocol TCP Services, TCP Header TCP Connection, Establishment and Termination, TCP Timeout and Retransmission, Repacketization; Telnet and Rlogin Remote Login Rlogin Protocol, SMTP Protocol; **FTP**: File Transfer Protocol and SMTP: Simple Mail Transfer Protocol.	08

Text Books:

1. Tannenbaum A. S., “Computer Networks”, Prentice-Hall India., New Delhi
2. Forouzan Behrouz A, “Data Communication and Networking”, TMH, New Delhi

Reference Books:

1 Sybex ,“Networking Complete”, BPB Publication, New Delhi

2. Stallings Willam, “Data and Computer Communication”, Pearson Education, New Delhi

CA 17. 362 **Knowledge Management** **3-1-0-4**

Total Lectures:40

1. **Introduction:** Definition, Evolution, Types, Implication for Knowledge Management [6]

2. **Life Cycle:** Challenges, Difference, Knowledge management system Life Cycle, Comparative Studies Between SDLC and Knowledge Management System Development, Role of Knowledge Developer. [8]

3. **Knowledge Creation and Architecture:** Knowledge Codification, Need of Codification, and Knowledge Tools for Codification, Developer Skills Set. [9]

4. **Knowledge Transfer and Internet:** Internet and Knowledge, E-Business, Ethical and Legal Issues in Knowledge Management. [8]

5. **Executive Information and support Systems**: Business Expert System and AI, OLTO & OLAP; Data Warehousing; Data Marts, Data Warehouse architecture; Tools for data warehousing. [9]

Text Books:

1. Awad, Elias M., "Knowledge Management", TMH, New Delhi

Reference Books:

1 Inmon, W. H., "Building Data Warehousing", Wiley, New Delhi

2 Han, Jiawei, Kamber, Michelinal, "Data Mining Concepts & Techniques", Harcourt India, New Delhi

Testing:

Flash editor and toolbox.
Frames and key frame concepts
Color schemes

Application programs based on above elements in different areas of computing like- Science, Business, Mathematics and other manual processes.

Testing:

Animation using shape tween and motion tween.

Application programs based on above elements in different areas of computing like- Science, Business, Mathematics and other manual processes.

Testing:

concept of layers
Understanding guide ,mask layer.

Application programs based on above elements in different areas of computing like- Science, Business, Mathematics and other manual processes.

Testing:

Animation using symbols (movie clip, graphic and buttons) and library.

Application programs based on above elements in different areas of computing like- Science, Business, Mathematics and other manual processes.

Testing:

Animation of text morphing.

Application programs based on above elements in different areas of computing like- Science, Business, Mathematics and other manual processes.

CA 16. 304 **Multimedia Technolgy** **3-0-0-3**

Total Lectures: 40

1. **Overview** - Multimedia - Definitions, Basic properties, Temporal and non temporal medium, Multimedia applications, Uses of Multimedia, Stages of multimedia project, requirements to make good multimedia, Multimedia skills and training.

   [6]
2. **Multimedia-Hardware and Software**: Production Platforms, Hardware Peripherals, Connections, Memory and Storage devices, Media software tools, Multimedia Authoring tools, Production Standards.

   [8]
3. **Multimedia building blocks**: Audio, basic sound concepts, music, speech, MIDI versus digital audio, audio file formats, sound for the web, images and graphics-basic concepts, Digital video production and editing techniques, animation-basic fundamentals, Kinematics, morphing , animation s/w tools and techniques, animation for the web.

   [10]
4. **Data Compression:** Need of Compression techniques, Difference of lossless/lossy compression techniques. Storage space and coding requirements, classification of coding, compression techniques-JPEG and MPEG.

   [9]
5. **Multimedia and Internet:** HTML and web authoring, Multimedia considerations for Internet, Design considerations for web pages ,Web Browsers, Web page makers and editors, Media Communication, Media Consumption, Media games.

   [7]

Text Book:

1. Steinmetz R., and Nahrstedt K., Multimedia - Computing, Communications and Applications, Pearson Education Asia, 2nd Ed., 2003.

References Books:

1. Buford J. F. K., Multimedia System, Addison-Wesley, 3rd Ed., 1994.
2. Vaughan T., Multimedia - Making it Work, Tata McGraw-Hill, 3rd Ed., 2002.

CA 17.367 **Network Security** **3-1-0-4**

Total Lectures:40

1 **Introduction:** Attacks, Services and Mechanisms, Security Attacks, Security Services, Integrity check, digital Signature, authentication, has algorithms. [3]

2 **Secret Key Cryptography:** Block Encryption, DES rounds, S-Boxes IDEA: Overview, comparison with DES, Key expansion, IDEA rounds, Uses of Secret key Cryptography; ECB, CBC, OFB, CFB, Multiple encryptions DES. [8]

3 **Hash Functions and Message Digests:** Length of hash, uses, algorithms (MD2, MD4, MD5, SHS) MD2: Algorithm (Padding, checksum, passes.) MD4 and 5: algorithm (padding, stages, digest computation.) SHS: Overview, padding, stages. [7]

4 **Public key Cryptography:** Algorithms, examples, Modular arithmetic (addition, multiplication, inverse, and exponentiation) RSA: generating keys, encryption and decryption. Other Algorithms: PKCS, Diffie-Hellman, El-Gamal signatures, DSS, Zero-knowledge signatures [7]

5 **Authentication:** Password Based, Address Based, Cryptographic Authentication. Passwords in distributed systems, on-line vs offline guessing, storing. Cryptographic Authentication: passwords as keys, protocols, KDC's Certification Revocation, Interdomain, groups, delegation. Authentication of People: Verification techniques, passwords, length of passwords, password distribution, smart cards, biometrics. [6]

6 **Example System:** Kerberos: purpose, authentication, serer and ticket granting server, keys and tickets, use of AS and TGS, replicated servers. Kerberos V4: names, inter-realm authentication, Key version numbers. Kerberos V5: names, realms, delegation, forwarding and proxies, ticket lifetimes, revoking tickets, multiple Realms. [4]

7. **Network Security:** Electronic mail security, IP security, Network management security. Security for electronic commerce: SSL, SET. System Security: Intruders and Viruses, Firewalls, Intrusion Detection. [4]

Text Books:

1. Atul Kahate," Cryptography and Network Security", TMH, New Delhi

2. Kaufman, C., Perlman, R., and Speciner, M., "Network Security, Private Communication in a public world" , PHI.

Reference Books:

1 Stallings, W., "Cryptography and Network Security: Principles and Practice", Prentice Hall.

2. Stallings, W., "Network security Essentials: Applications and standards", Prentice Hall.

3. Behrouz A Forouzan, "Cryptography and Network Security"; McGraw Hill;.

CA 17. 373 **Software and CASE Tools** **3-1-0-4**

Total Lectures:40

1. **Software Engineering Fundamentals :** Definition of software product and process, Software Characteristics, Components, Applications, Layered Technologies, Processes and Product, Methods and Tools, Generic View of Software Engineering, Software Crisis and Software development paradigms, [5]
2. **Software Requirements Analysis & Specification:** System specification, Software requirements specification (SRS) standards, Analysis Modeling: Difference between Data and Information, ER Diagram, Dataflow Model, Control Flow Model, Control and Process Specification, Data Dictionary [8]
3. **Software Design:** Software architecture, Modular design - cohesion and coupling, Process-oriented design, Data-oriented design, User-interface design, Real-time software design, introduction to Object Oriented Design. [7]
4. **CASE Tools, Coding and Testing** Computer-aided software engineering, Introduction to CASE, Building Blocks of CASE, Integrated Case Environment, Characteristics of good Programming languages, Introduction to Testing Process, Testing Activities like Unit, Integration & System Testing. [7]
5. **Software Reengineering:** Business Process Reengineering, Reverse Engineering, Software re-engineerin.. [5]
6. **Software Quality and Metrics:** SQA-Software Quality Assurance, Software Reliability, Software quality metrics, SQA plan, ISO 9000 and 9001 Quality Standards. [8]

Text Books:

1. Pressman R.S. , "Software Engineering", TMH.
2. Rumbaugh James ,Object Oriented Modeling and Design, Prentice Hall- Gale
3. The Unified Modeling Language User Guide - Grady Booch, James Rumbaugh, Ivar Jacobson.

Reference Books:

1 Pankaj Jalote,"An Integrated Approach to Software Engineering", NAROSA.
2 Designing Flexible Object Oriented systems with UML - Charles Ritcher
3 Fairely, R.E., "Software Engineering Concepts", McGraw-Hill
4 Object-Oriented Analysis and Design: using UML Mike O'Docherty Wiley Publication

CA 16. 303 **Software Engineering** **3-0-0-3**

Total Lectures:40

1. **Introduction:** Software Characteristics, Components and Applications, Software Engineering a layered Technology, Software life cycle models, Waterfall, Prototype, Evolutionary and Spiral Models. [8]

2. **Software Project Management:** Basic Concepts, Project Management: Core functions, support functions, Project Integration Management. [8]

3. **Software Project Planning:** Objectives, decomposition techniques: software sizing, problem based estimation, lines of code based estimation, and function point based estimation, process based estimation, Cost Estimation Models:- COCOMO, Risk Management. [8]

4. **Software Design:** Design Principles, Design Concepts:- abstraction, refinement, modularity, software architecture, structured partitioning, information hiding**,** effective Modular Design:- functional independence, cohesion and coupling, Object Oriented analysis and Design. [8]

5. **Software Testing:** Testing Fundamentals, Design of Test Cases, White box testing, Basis Path testing, Control structure Testing, Black box testing. [8]

Text Books:

1. Pressman R.S., "Software Engineering", Tata McGraw Hill Publishing Company Ltd., New Delhi.

Reference Books:

1 Jalote Pankaj,"An Integrated Approach to Software Engineering", NAROSA.
2 Sommerville, Ian "Software Engineering", Pearson Education
3 Fairely, R.E., "Software Engineering Concepts", McGraw-Hill

CA 17. 363 **System Software** **3-1-0-4**

Total Lectures:40

1. **Overview:** Language processors, data structures for language processors, assemblers, macros and macro processors, compilers, interpreters, linkers and loaders. [5]

2. **Operating System:** Functions of Operating System, Kernel, Shell, Process, Process state diagram, System Calls. [5]

3. **Assemblers:** Design of an assembler ,one pass and two pass Assembler, Databases of Assemblers, table processing [7]

4. **Macro Processors:** Importance of Macro, Macro Definition, Macro call, Macro Expansion, Conditional Macro expansion, Nesting of Macros, Functions of Macro Processor . [8]

5. **Loaders and Linkers:** Function of Loaders, loader schemes - compile and go, general, absolute, subroutine linkages, relocating loaders, direct linking loaders, binders, linking loaders, overlays, dynamic binders. [9]

6. **Compilers :** Types of Compilers, Phases of compiler design, recursion, call and return statements. [6]

Text Books:

1. Donovan J.J., "Systems Programming", New York, Mc-Graw Hill, 1972.

Reference Books:

1 Leland L Beck,"System Software, An Introduction to System Programming", Pearson Education, 13th Indian Reprint, New Delhi, 2003.

2 Dhamdhere, D.M., "Introduction to Systems Software", Tata Mc-Graw Hill 1996.

Testing:

Markup Tags
Formatting Tags
Frames
Form Elements

Programs:

Design web pages based on above Tags.
Design and formatting a form based on form elements

Testing:

Cascading Style sheets
Dragging
Dropping
Div tag.

Programs:

Based on above CSS formatting on HTML scripts.

Testing:

java Script Declaration and Expressions
Control Structure and Functions
Java Script: Properties and Methods
Array Object
Date Object
Math Object
String Object
Events in java Script: Onblur, Onclick, on change, on focus.

Programs:

Form validation through JavaScript
Program for Event handling
Working with Date and Time Functions
Program for calculator

Testing:

VBScripts String
Date and Time
Arrays
control Structure
Looping
Methods and events
data validation

Programs:

Form validation through VBScript
Program for Event handling
Working with Date and Time Functions

Testing:

XML components
DTD
Creating a Valid Document From a DTD

Programs:

Basic XML Document
Access XML document elements through programs

CA 16.301 **Web Technology** **3-0-0-3**

Total Lectures:40

1. **Introduction:** Clients, Servers, and Communication, The Internet Basic Internet Protocols, The World Wide Web, HTTP request message, response message, Web Clients Web Servers. [5]

2. **HTML:** HTML Document, Markup Tags (HTML, HEAD, TITLE, BODY, PRE, LIST, HR, BR), Formatting Tags (MARQUEE, BOLD, ITALICS, SUBSCRIPT), Linking, URL, Relative Path Vs Absolute Path names, Images, Tables, Frames, Form Elements (Text, Buttons, List, Reset, Submit, Radio buttons, Checkbox); DHTML: Cascading Style sheets, Dragging, Dropping, Layers, Div tag. [8]

3. **JavaScript:** Declaration and Expressions, Control Structure and Functions, Variable scope Global Vs Local, Object in Java Script: Properties and Methods, Array Object, Date Object, Math Object, String Object, Events in java Script: Onblur, Onclick, on change, on focus, Design of Interactive forms; [9]

4. **VBScript:** Fundamentals, Variables, String, Constant, Date and Time, Arrays, control Structure, Design making, looping, Sub procedure, Object Methods and events, data validation. [7]

5. **XML:** Overview, Comparison of XML and html, components of XML, XML document, XML declaration, Root element, An empty element, attributes, Markup Delimiters, Element Mark Up, Attribute Mark Up, Naming Rules, Character References, Predefined Entities, Entity References, Cdata Sections, Processing Instructions, Document Type Declaration, Welformed and Valid Document, DTD and Validation, Internal DTD Subset, External DTD, Developing DTD, Elements and Attributes Of DTDs:- Empty Element, Only Element, Mixed Elements, Any Element, Creating a valid document from a DTD.

[11]

Text Books:

1. Young M .L, " Internet Millenum Edition" TMH, New Delhi.
2. Jackson Jeffrey C., "Web Technologies -A Computer Science Perspective", Pearson Education, 2006.

Suggested Reading

1. Noel Jerkr, " Techunedia VB Scraper VB Script Interleave course", New Delhi 1998
2. Marlin Webb, "Java Scraper, Instant JavaScript", Tata McGraw-Hill, New Delhi.
3. Eathier Kay and Houser Alan **, "**XML programming in 2 ½ days," IDG Books India (P) Ltd.

Mody University of Science & Technology, Lakshmangarh (Sikar)

College of Engineering & Technology

Department of CSE

Course structure for

B. Tech CSE

MA-14.101 **Mathematics-I** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): NIL

Objective(s):

- To acquire fundamental knowledge of Mathematics and apply in engineering disciplines.

1. **Calculus:** Review of basic concepts, partial differentiation, Euler's theorem on homogeneous functions, Taylor's series and Jacobian, maxima and minima of functions of two variables, asymptotes, tracing of simple Cartesian curves, length of plane curves, area bounded by the curves, multiple integrals (double and triple integrals, change of order of integration), physical interpretations and applications. [16]

2. **Three-dimensional Geometry**: Direction cosines and direction ratios of a straight line, equation of a plane,plane passing through intersections of two planes, equations of astraight line, theshortest distance between two skew lines, theequation of a sphere, intersection of plane and sphere. [10]

3. **Matrix Theory**: Rank of matrix, linear dependence and independence of vectors, solution of system of simultaneous linear equations, Eigen values, Eigenvectors of a matrix, statement of Cayley-Hamilton theorem (without proof) , reduction of a matrix to diagonal form, quadratic forms, linear transformation of a quadratic form, and applications. [10]

4. **Theory of Equations**: Introduction of polynomials, therelation between roots and coefficients, Cardon's method. [4]

Outcome(s):

- After completion of the course, students would be able to apply mathematical knowledge in engineering and solve curriculum problems.

Text Books:

1. Grewal, B.S. and Grewal, J.S., Higher Engineering Mathematics, Khanna Publishers, Daryaganj, New Delhi, 43rd Edition, 2013.
2. B. V. Ramana, Higher Engineering Mathematics, Tata McGraw-Hill Publishing Company Limited, New Delhi, 3rd Edition 2008.

Reference Books:

1. Kreyszig Erwin, Engineering Mathematics, John Wiley and Sons, New York, ISBN: 04717289777/0471726478, 9th Edition, 2005.
2. Veerarajan T., Engineering Mathematics (for first year), TMH Publishing Company Limited, New Delhi, 2nd Edition 2006.

MA-14.102 **Mathematics-II** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): MA-14.101

Objective(s):

- To acquire fundamental knowledge of Mathematics and apply in engineering disciplines.

1. **Computational Methods**: Introduction and importance of numerical analysis, calculus of finite differences, interpolation schemes for equal and unequal intervals (Newton's forward and backward interpolation formulae), divided difference, interpolation for unequal intervals (Newton's divided difference and Lagrange interpolation formulae), solution of algebraic and transcendental equations by Newton-Raphson method, applications to Engineering. [13]

2. **Ordinary Differential Equations:** First order and first-degree differential equations (variable separable, homogeneous, linear, exact equations, linear differential equations of second order with constant and variable coefficients (complementary functions and particular integrals) and applications. [12]

3. **Partial Differential Equations**: Formation of partialdifferential equations, Lagrange's multipliers method for thesolution of first order differential equations, separation of variables for nonlinear differential equations and applications. [5]

4. **Vector calculus**: Vector and scalar point functions, conservative fields, gradient of scalar point functions, divergence and curl of vector point functions (Solenoidal and irrotational vectors), directional derivative of scalar point functions, work done along a curve, integration of vectors, line integral (work done), surface integral, volume integral, physical interpretations and applications. [10]

Outcome(s):

- After completion of the course, students would be able to apply mathematical knowledge in engineering and solve curriculum problems.

Text Books:

1. Grewal, B.S. and Grewal, J.S., Higher Engineering Mathematics, Khanna Publishers, Daryaganj,New Delhi, 40th Edition, 2007.
2. B. V. Ramana, Higher Engineering Mathematics, Tata McGraw-Hill Publishing Company Limited,New Delhi, 2nd Edition 2007.

Reference Books:

1. Kreyszig Erwin, Engineering Mathematics, John Wiley and Sons, New York, , 10th Edition, 2010.
2. Veerarajan T., Engineering Mathematics (for first year), TMH Publishing Company Limited, New Delhi, 5th Edition 2015.

PY-14.101 **Engineering Physics** **Total Lectures: 40**

Credit: 3-0-0-3

Prerequisite(s): NIL

Objective(s):

- To make a bridge between the physics in school and engineering courses.

1. **Modern Physics**: Introduction to black body radiation spectrum, photoelectric effect, Compton effect. Wave-particle Dualism, deBroglie hypothesis, de Broglie wavelength, extension to electron particle, Davisson and Germerexperiment,matter waves and their characteristic properties, phase velocity, group velocity and particle velocity, relation between phase velocity and group velocity, relation between group velocity and particle velocity,expression for deBr;oglie wavelength using group velocity. [8]

2. **Quantum Mechanics:** Heisenberg's uncertainty principle and its physical significance, application of uncertainty principle (non-existence of electron in the nucleus, explanation for decay and kinetic energy of electron in an atom), wave function, properties and physical significance of wave function, probability density and normalization of wave function,setting up of one dimensional time independent Schrodinger wave equation, eigenvalues and eigenfunctions, application of Schrodinger wave equation, energy eigenvalues for a free particle,energy eigenvalues and eigenfunctions for a particle in a potential well of infinite depth. [7]

3. **Electrical Conductivity in Metals**: Free–electron concept, classical free electron theoryAssumptions, drift velocity, mean collision time and mean free path, relaxation time,expression for drift velocity, expression for electrical conductivity in metals,effect of impurityand temperature on electrical resistivity of metals,Quantum free electron theory assumptions, Fermi – Dirac statistics, Fermi-energy, Fermifactor, density of states (No Derivation),expression for electrical resistivity / conductivity,temperature dependence of resistivity of metals, electron in a periodic potential, origin of theenergy gap, band theory of solids, distinction of solids into metals, semiconductors andinsulators. [8]

4. **Dielectric & Magnetic Properties of Materials**: Dielectric constant and polarization of dielectric materials, types of polarization, equation for internal field in liquids and solids (one dimensional), Ferro and Piezoelectricity,frequency dependence of dielectric constant, important applications of dielectric materials,classification of dia, para and ferro-magnetic materials, hysteris in ferromagnetic materials, soft and hard magnetic materials,applications. [7]

5. **Lasers and Optical Fibers**: Einstein's coefficients (expression for energy density), requisites of a Laser system, condition for laser action, principle, construction and working of CO_2 laser and semiconductor laser, applications of laser – Laser welding, cutting and drilling, measurement of atmospheric pollutants, holography–principle of recording and reconstruction of images, applications of holography, propagation mechanism in optical fibers, angle of acceptance, numerical aperture, types of optical fibers and modes of propagation, attenuation, application, block diagram discussion of point to point communication. [10]

Outcome(s):

- The student will be able to understand many modern devices and technologies based on lasers and optical fibers. A student can also appreciate various material properties which are used in engineering applications and devices.

Text Books:

1. S. O. Pillai, Solid State Physics, 8th Edition, New Age International, 2018.
2. V. Rajendran, Engineering Physics, TMH,2nd edition 2010.

Reference Book:

1. G. K. Shivkumar, Engineering Physics, Prism Book Pvt. Ltd,2011.

CY-14.101 **Engineering Chemistry** **Total Lectures: 40**

Credit: 3-0-0-3

Objective(s):

- To purify the most valuable natural resource of the future-water.
- To understand one of the most versatile Engineering Materials: Polymers their preparation, properties and uses.
- To develop the basics of protecting engineering materials from the natural forces.
- To understand the present-day up-to-date knowledge of the contemporary energy sources.
- To build up the basis of the future Engineering materials like superconductors, conducting organic polymers, Nanomaterials etc.

1. **Water treatment**: Hardness, types of hardness, determination of hardness by complex metric (EDTA) method, degree of hardness, boiler troubles: corrosion, sludge and scale formation, prevention of sludge and scale formation in boilers, methods of boiler water treatment: lime-soda process, permutit (zeolite) process, ion exchange methods, numerical problems based on water treatment (lime-soda process). [10]

2. **Organic and Inorganic Polymers:** Classification, functionality, types of polymerization, mechanism of addition polymerization, plastics: thermoplastic and thermosetting resins, preparation, properties and uses of Polyamides, Bakelite, Polyesters, Rubber, vulcanization of rubber, synthetic rubber viz. Buna-S, Buna-N, Butyl and Neoprene rubbers, Silicones-polysiloxanes and Sulphur based polymers. [8]

3. **Electrochemistry and Corrosion**: Classifications (Galvanic cell, electrolytic cell), types of electrodes (reference electrodes-standard hydrogen electrode, indicator electrodes- glass electrode), theorigin of electrode potential, Nernst equation of electrode potential. electromotive force, electrochemical series. corrosion: definition and its significance, theories of corrosion, mechanism of corrosion, types of corrosion, Galvanic cell, and concentration cell, water line corrosion, pitting & stress corrosion (caustic embrittlement), protection against corrosion, corrosion control (corrosion inhibitors, cathodic protection - sacrificial anodic and impressed current cathodic protection),protective metallic coatings. [10]

4. **Fuels:** Classifications of fuels, Comparison of solid, liquid & solid fuels, Calorific value of a fuel, Bomb calorimeter, determination of LCV & HCV, petroleum: origin, composition, processing, cracking, synthetic petrol, refining, reforming, knocking, unleaded petrol, LPG as a gaseous fuel, numerical problems based on combustion. [6]

5. **New Engineering Materials**: Introduction: superconductors, high and low-temperature superconductors, organic electronic materials, fullerenes and nanomaterials, industrial applications of fullerenes and nanomaterials. [6]

Outcomes: The student will be able to understand the basis of the future Engineering materials like of superconductors, conducting polymers, Nano materials etc and purification of the most valuable natural resource of the future-water

Text Books:

1. O.G. Pananna, “Engineering Chemistry” 2nd Edition, McGraw Hill Education, 2017
2. Jain and Jain, “Engineering Chemistry,” 16th Edition, DhanpatRai Publishing Company, 2013.

Reference Books:

1. C. Housecroft, A.G. Sharpe, Inorganic Chemistry, 4th Edition, , Pearson Education Limited, England, 2012.
2. Atkins, “Physical Chemistry,” 8th edition,W. H. Freeman and Company New York, 2006.
3. William D. Callister, “Materials Science and Engineering: An Introduction, Eighth Edition,.John Wiley & Sons, Inc, 2010.
4. Bokris and Reddy, “Modern Electrochemistry,” 2nd Edition, Kluwer Academic Publishers New York, 2004.

ME-14.101 **Applied Mechanics** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): NIL

Objective(s):

- This course will help the student to acquire knowledge of basic engineering mechanics concepts and enhance their ability to solve open-ended engineering problems.
- To provide the student with a clear and thorough understanding of the theory and applications of engineering mechanics, covering both statics and dynamics.
- To provide the student with a thorough understanding of the concept, drawing, and the use of free-body diagrams.
- To be able to determine the Centre of Gravity and Moments of Inertia of simple geometric shapes and understand the physical applications of these properties.
- To understand the use and be able to perform calculations related to friction forces in engineering applications.

1. **Introduction:** Idealization of Mechanics, theconcept of Rigid Body, External Forces (Body forces & surface forces), Laws of Mechanics. [3]

2. **Force Systems and Equilibrium**: Introduction to vector, Statically Equivalent Force systems,Free Body Diagram, Equations of equilibrium and their applications to thevarious system of forces. [8]

3. **Distributed Forces and Moment Of Inertia**: Centroid of Composite figures, Area Moment of Inertia, Mass Moment of Inertia, Principle axes and Principle Moment of Inertia. [5]

4. **Friction:** Introduction of friction, Laws of friction, wedge, screw, belt, rolling friction. [5]

5. **Tension,Compression, and Shear:** Normal stress and strain, Linear elasticity, Hooke's Law and Poisson's Ratio, Shear stress and shear strain, Relationship between modulus. [4]

6. **Beams:** Different support & load conditions, SFD, BMD [5]

7. **Kinematics of Particles**: Introduction, Rectilinear motion, Plane curvilinear motion, Rectangular coordinates, Tangential and normal coordinates, polar coordinates, Relative motion (Translating Axes), constrained motion of connected particles. [5]

8. **Kinetics of Particles:** Introduction, Force, Mass and acceleration, Newton's second law of motion, Equation of motion and solution of problems, Work and Energy, Impulse and Momentum. [5]

Outcome(s):

- The students shall develop the ability to identify, formulate, and solve engineeringproblems related to forces and motion.

Text Books:

1. Timoshenko, S, Young, D.H, Rao, J.V, Engineering Mechanics, 4th edition TMH, 2010.
2. Merian, J.L, Kraige, L.G., Engineering Mechanics Vol I & II, 7th edition Wiley India 2015.

Reference Books:

1. Hibbeler, Gupta R. C., Engineering Mechanics, 11th ed.,Pearson India, 2010.

EE-14.101 **Elements of Electrical Engineering** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): NIL

Objective(s):

- This course facilitates the students to get a comprehensive exposure to various concepts and devices of electrical engineering.

1. **Introduction:** Background, major inventions, scope, significance and job opportunities in electrical engineering,brief overview of various energy resources. Apparatus used in generation, transmission, and distribution of electrical power and various industries. [3]

2. **D.C. circuits:** Review of circuit elements, voltage sources, current sources, ohms law,KVL, KCL, source transformation, mesh current and node voltage analysis of circuits. [5]

3. **Network Theorems**: Superposition theorem, Thevenin's theorem, Norton's theorem, Maximum Power Transfer theorem, star-delta transformation. [6]

4. **Single phase A.C. circuits:** Basic terminologies, average &RMS values of a.c. quantities, phasor representation, theresponse of R, L, C and their combination to a.c. excitation, theconcept of power and power factor in a.c. circuits. [6]

5. **Three phase A.C. circuits:** Three phase supply, phase sequence, star connection, delta connection, therelationship betweenphase andline quantities in 3-phase circuits, measurements of three-phase power underbalanced condition. [6]

6. **Magnetic Circuits & Transformer**: Magnetic circuit, mutually coupled circuit, Transformer: working principle, emf equation, ideal & practical transformer, equivalent circuits, transformer testing: open circuit and short circuit test, losses, voltage regulation and efficiency. [8]

7. **Rotating Machines:** Electro-mechanical energy conversion, introduction to rotating machines and applications [6]

Outcome(s):

- The students shall develop an insightful knowledge on various fundamental elements and devices of electrical engineering.

Text Books:

1.Nagrath& Kothari, Theory and Problems of Basic Electrical Engineering, 2nd edition PHI Publication,2017.
2. Fitzgerald & Kingsley, Basic Electrical Engineering, 6th edition TMH publication,2002.

Reference Books:

1. H.Cotton, Advanced Electrical Technology, CBS Publication,2005.

EC-14.101 **Basics of Electronics Engineering** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): NIL

Objective(s):

- This course would facilitate the learner to acquire good exposure to electronics and communication engineering.

1. **Introduction:** Brief history of major inventions, scope, significance and job opportunities in electronics and communication engineering, Overview of various specializations in ECE, Electronic testand measurement equipment's, Specifications for electronic components. [3]

2. **Semiconductors:** Material and its properties, Formation of energy band diagram, Currents in semiconductors, Fermi-Dirac energy distribution, Types of semiconductors – Intrinsic and Extrinsic, Mass action law, Hall effect. [5]

3. **Diodes:** Introduction, Characteristic of ideal and real diode, Current components in thediode, load characteristics, Breakdown in thediode, Zener diode, Varactor diode, Tunnel diode, Clippers and Clampers, Rectifiers – Half and Full-wave rectifiers. [8]

4. **Transistors:** Introduction to PNP and NPN transistors, current components, active, cutoff and saturation regions, CC, CB and CE configuration, Operating point, Biasing circuits, Bias Stability, Thermal runway and thermal stability. [8]

5. **Signals:** Definition, Classification of signals – Analog and Digital, Deterministic and Random signals, Power and Energy of signals, Bandwidth, Bit and Baud rate. [4]

6. **Basics of Communication**: Definition, Block representation of communication system, Modulation – Definition, Need for modulation, Frequency translation, Types of modulation - Analog and Digital, Multiplexing – TDM and FDM. [6]

7. **Applications of Communication**: Introduction to - Optical Fiber, Transmission line, Waveguides, Satellite communication, and RADAR. [6]

Outcome(s):

- The learners are expected to have an overview of electronics and communicationengineering and learn the introductory concepts in each of the specializations in ECE.

Text Books:

1. George Kennedy, Bernard Davis, Electronics Communication Systems, 4th Edition, Tata McGraw-Hill, 2009.
2. Behrouz Forouzan, Data Communication, and Networking, 5th Edition, McGraw-Hill, 2012.
3. Robert L. Boylestad, Louis Nashelsky, Electronics Devices and Circuits Theory, 11th Edition, Prentice Hall,2013.

Reference Books:

1. David A. Bell, Electronics Devices, and Circuits, PHI, 4th edition, 2008.
2. Wayne, Tomasi, Advanced Electronic Communication Systems, 6th edition, PHI, 2013.

CS-14.101 **Programming Language** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): NIL

Objective(s):

- To learn principles of programming by the structured native language 'C'.
- To comprehend the rudiments, constructs, syntax, and statements with essentials of efficient compiling, running and debugging processes.

1. **Introduction:** The role of programming languages, programming paradigms, language description and syntax structure, basics of structured programming, object-oriented programming, functional programming, logic programming, concurrent programming. [10]

2. **Fundamentals of 'C' language** : Character set, variables data types constants, arithmetic,relational and logical operators, type conversion,increment,decrement, bitwise and assignment operators, conditional expressions, statements and blocks, *if-else*,*switch*, loops-*do-while*, *while*, *for*; *break*, *continue* and *goto* statements, labels. [10]

3. **Functions, pointers and Arrays**: Basics of functions, automatic, external, static and register variables, scope rules, and header files, recursion and C preprocessor, arrays, pointers and addresses, pointers and arrays address arithmetic, character pointers and functions, pointer arrays, pointers to functions, pointers and multidimensional arrays, command line arguments. [10]

4. **Structures, unions and file processing:** Basics of structures, structures, and functions, arrays of structures, pointers to structures, self-referential structures, unions, bit fields, theconcept of files, standard input and output, formatted output, file access in different modes, reading from and writing to a file. [10]

Outcome(s):

- Students would be able to apply learning and knowledge of C language analytically, critically and logically to solve mathematical, scientific and real-life problems in an efficient manner.

Text Books:

1.Brain W. Kernighan and Dennis M. Ritchie, The C Programming Language, Second edition, Pearson Education, 2013,
2.Ravi Sethi&K.V.Viswanatha, Programming Languages-Concepts, and Constructs, Second edition, Pearson Education,2013,

Reference Books:

1.Herbert Schildt, C: The Complete Reference, Fourth Edition, McGraw-Hill Education, 2017
2.E Balagurusamy, Programming in ANSI C, Tata McGraw - Hill Education,6th edition,2012

ME-14.111 **Computer Aided Engineering Drawing** **Total Lectures: 40**

Credit: 0-0-4-2

Prerequisite(s): NIL

Objective(s):

- To improve the visualization skills.
- To enable the students with various concepts like dimensioning, conventions and standards related to working drawings in order to become professionally efficient.
- To impart the knowledge of understanding and drawing of simple engineering products.

1. **Introduction to Computer Aided Sketching**: Introduction, Drawing Instruments and their uses, BIS conventions, Lettering, Dimensioning and freehand practice. Board Drawing vs. Computer- Aided Drawing. Introduction to Solid works Environments. Computer screen, thelayout of the software, standard toolbar/menus and description of most commonly used toolbars, navigational tools. Co-ordinate system and reference planes. Definitions of HP, VP, RPP &LPP. Creation of 2D/3D environment. Selection of drawing size and scale. Commands and creation of Lines, Co-ordinate points, axes, dimensioning, line conventions, material conventions and lettering. [8]

2. **Orthographic Projections**: Horizontal planes, Vertical planes, Front view, Top view, Side view, Projections, theFirst and Third angle of projection, Projections of points, Principles of orthographic projections, Sketching of different views of given objects. Introduction to sketching in Solid works : 2-Dimensional Sketching, Sketching in Solid works, poly-lines, square, rectangle, polygons, splines, circles, ellipse, text, move, copy, off-set, mirror, rotate, trim, extend, break, chamfer, fillet, curves, constraints viz. tangency, parallelism, inclination, and perpendicularity. [12]

3. **Projections of Lines, Planes, and Solids**: Lines inclined to both the principal planes, theprojection of Lamina inclined to both principal planes, Projections of solids: Axis inclined to both the reference planes and Intersection of solids. Introduction to thepart module in Solid works: Extrude, Revolve, Sweep, Hole, Filleting, and Chamfering features. [12]

4. **Sections of solids and sectional orthographic views:** Sectional orthographic projections - Full,Half, Partial, revolved and removed surfaces. Introduction to drawing module in Solid works:Standard 3 views, Auxiliary view, Section View, Projected view. [12]

5. **Isometric Projection:** Terminology, Isometric scale, Box method, Coordinate or offset method, Four-center method, theisometric projection of arcs. Solid models practice using Solid works partmodule. [8]

Outcome(s):

- Students will be able to improve their visualization skills so that they can apply these skills in developing new products.
- Students will be able to know and understand the conventions and the methods of engineering drawing using Solid works.
- Students will be able to prepare simple drawings of engineering products.

Text Books:

1. N.D. Bhatt, "Engineering Drawing",Charotar Publishing House, 2017.
2. Prof. Sham Tickoo, Sandeep PremDass Solid works 2013 for Engineers and Designers Wiley Publication, 2017.

Reference Books:

1. Randy H. Shih, Solid works 2017 and Engineering Graphics: An Integrated Approach, SDC Books: Publications. 2017
2. David Planchard, "Engineering Graphics with Solid Works 2014 and Video Instruction", SDC Publications, 2013.

CS-14.111 **Programming Lab** **Credit: 0-0-2-1**

Prerequisite(s): NIL

Objective(s):

- To learn the implementation of programming language.

1. **C- Language Basics**: 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.
2. **Control Statements**: 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.
3. **Functions:** 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.
4. **Arrays:** 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.
5. **Pointers:** 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.
6. **Structure and Union**: 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.
7. **I/O and File Structure**: 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.

Outcome(s):

- The students will be able to implement efficiently the logic into a program.

PY-14.111 **Physics Lab** **Credit: 0-0-2-1**

Prerequisite(s): NIL

Objective(s):

- To make the students gain practical knowledge to co-relate with the theoretical studies.

1. To study the material constant, temperature coefficient of current and Planck's constant.
2. To determine the specific resistance of a given wire by using the Carey Foster's bridge.
3. To determine the ballistic constant, K of a moving coil ballistic galvanometer with a standard capacitor of known capacity.
4. To determine the high resistance by the method of leakage of a condenser with the help of ballistic galvanometer.
5. To study the variations of resistivity with temperature and hence determines the energy band gap of the given semiconductor with help of four probe method.
6. To convert a galvanometer into a voltmeter of a given range.
7. To convert a galvanometer into an ammeter of a given ranges.
8. To plot graph showing the variation of magnetic field with distance along the axis of a circular coil carrying current and to estimate from it the radius of the coil.

Outcome(s):

- After completion of the course, students would be able to develop the skills necessary to perform experiments in physics and acquire an experience of the methods used and analysis needed in experimental physics.

CY-14.111 **Chemistry Lab** **Credit: 0-0-2-1**

Prerequisite(s): NIL

Objective(s):

- To provide students with practical knowledge of quantitative analysis of materials by classical and instrumental methods for developing experimental skills in building technical competence.

1. To determine the Total, Temporary and permanent hardness of water by EDTA method.
2. To determine the % of available chlorine in a sample bleaching powder.
3. To determine the alkalinity of given water sample.
4. To prepare urea formaldehyde resin.
5. To determine the Calorific value of a fuel by bomb calorimeter.
6. Determination of the strength of HCl by titrating it against NaOH pH metrically.

7.Determination of the strength of HCl by titrating it against NaOHconductometrically.

Outcome(s): On completion of this course, students will have the knowledge in

- Handling different types of instruments for analysis of materials using small quantities of materials involved for quick and accurate results.
- Carrying out different types of titrations for estimation of concerned in materials using comparatively more quantities of materials involved for good results.

ME-14.112 **Mechanical Workshop** **Credit: 0-0-2-1**

Prerequisite(s): NIL

Objective(s):

- To learn various hand tools used in fitting, carpentry and sheet metal shop.
- To learn about lathe and drilling machine and their operations.
- To learn how various joints are made using wood and other metal pieces.

1. Fitting Shop: Prepare job that contains various fitting operation like filing, marking, measuring, cutting, drilling etc.

2. Carpentry Shop: Making of carpentry joint (T, L joint etc).

3. Sheet Metal Shop: Making job from thesheet (funnel, tray etc).

4. Machine Shop: Perform various operations like turning, step turning, facing, chamfering, knurling etc. on Lathe.

Outcome(s): Students will able to:

- Understand use of tools of Fitting, Carpentry & Sheet Metalworking operations
- Study and practice on lathe and drilling machine and their operations
- Acquire engineering skills in Fitting, Carpentry & Sheet Metalworking operations

EE-14.111 **EEE Lab** **Credit: 0-0-2-1**

Prerequisite(s): NIL

Objective(s):

- The objective of this course is to introduce the students to the basic concepts of Electronics Engineering.
- The aim of this course is to study the fundamental aspects of Electronics Engineering.
- To acquire the knowledge of hardware and verify the results on Multisim software.
- This lab facilitates the students to get a comprehensive exposure to operations of AC and DC machines, measurements of various parameters and applications of electrical machines.

Practical to be performed on Hardware:

1. Introduction to basic electronics components and study of breadboard, CRO, function generator, multimeter, and D.C. power supply.
2. To plot VI characteristics of p-n junction diode and Zener diode.
3. To design a half wave rectifier with and without filter circuit and find the ripple factor.
4. To design a full wave rectifier with and without filter circuitand find the ripple factor.
5. Study of clipper and clamper circuits and implement on abreadboard.
6. To perform soldering and de-soldering to make abanana probe, BNC probe, and connection on PCB.
7. To conduct open circuit test and short circuit test on single phase transformer and to determine equivalent circuit parameters.
8. Measurement of three-phase power by using two wattmeter methods.
9. Speed control of DC machine by field current control method.
10. To construct a fluorescent tube wiring and to measure thevoltage across tube rod, thevoltage across choke and current.

Practical to be performed using Multi-Sim Software:

1. An Introduction to Electronic Circuit Simulation using **Multi-Sim Software**.
2. To verify Ohm's law and Kirchhoff's law.
3. Simulate half wave and full wave bridge rectifier.
4. To plot VI characteristics of p-junction diode

Outcome(s): After completion of the course, students would be able to:

- To use the technique, skills, and modern engineering tools necessary for engineering practice.
- Able to explain the basic concepts of basic electronics components.
- Able to describe& explain Clipper and Clamper circuits, V-I Characterization of p- n junction & Zener diode.
- The students shall develop an insightful knowledge on various ac and dc machines with their industrial applications.

CS-14.201 **Discrete Structures** **Total Lectures: 40**
Credit:3-1-0-4

Prerequisite(s): None

Objective(s):
- To Introduce fundamental concepts and applications of discrete structure in the field of computer science

1. **Sets, Relations and Functions**: Set theory, combination of sets, multi-sets, ordered pairs, set identities, relations, operations on relations, properties of relations, composite relations, equality of relations, order of relations, functions, classification of functions, operations on functions, recursively defined functions. [8]
2. **Partially Ordered Sets:** Definition, combination of partial order sets, Hasse diagram, lattices: definition, properties of lattices: bounded, complemented, modular and complete lattice, morphisms of lattices. [6]
3. **Algebraic Structures:** Groups, subgroups and order, cyclic groups, cosets, Lagrange's theorem, normal subgroups, permutation and symmetric groups, group homomorphisms, rings, fields, integers modulo n. [6]
4. **Propositional Logic:** Proposition, well formed formula, truth tables, tautology, satisfiability, contradiction, algebra of proposition, theory of inference, natural deduction, predicate logic: first order predicate, well formed formula of predicate, quantifiers, and inference theory of predicate logic. [7]
5. **Counting:** Basic principles, permutations, combinations, summations, principle of inclusion and exclusion, pigeon-hole principle, generating functions and recurrence relations. [6]
6. **Graph Theory:** Graphs, isomorphic and homomorphic graphs, subgraphs, Eulerian chains and cycles, Hamiltonian chains and cycles, graph traversal algorithms, chromatic number, plannar graph. [7]

Outcome(s): On the successful completion of the course, the student will be able to:
- Understand the theory and techniques of logic, graphs and trees, and algebraic systems.
- Apply the knowledge and skills obtained to investigate and solve a variety of discrete mathematical problems.

Text Books:
1. Bernard Kolman, Robert C., Busb Sharon, Cutler Ross, Discrete Mathematical Structures, PHI, 6th Edition, 2009.
2. Kenneth H. Rosen, Discrete Mathematics and Its Applications, Tata McGraw- Hill, 7th Edition, 2011.

Reference Books:
1. Swapan Kumar Chakraborty, BikashKanti Sarkar, Discrete Mathematics, Oxford Higher Education, 2011
2. C. L. Liu, D. P. Mohapatra, Elements of Discrete Mathematics A Computer Oriented Approach, Tata Mcgraw-Hill, 3rd Edition, 2008.

CS -14.203 **Data Structures** **Total Lectures: 40**
Credit:3-0-0-3

Prerequisite(s): CS-14.101(Programming Language)

Objective(s):

- To provide knowledge of ways of structuring and operating on data, the nature of some fundamental problems, methods for addressing those problems, and to promote an analytical and empirical appreciation of the behavior of algorithms using data structures

1. **Introduction:** Basic terminology, elementary data organization, algorithm, efficiency of an algorithm, time and space complexity, asymptotic notations, time-space trade- off, abstract data types. [4]
2. **Array:** Definition, single and multidimensional arrays, representation of arrays: row major order, and column major order, application of arrays, sparse matrices and their representations. [4]
3. **Searching & Sorting:** Sequential search, binary search, comparison and analysis, hash function, collision resolution strategies, insertion sort, selection sort, bubble sort, quick sort, merge sort, heap sort, radix sort. [6]
4. **Linked list:** Singly linked lists, doubly linked list, circular linked list, insertion, deletion, traversal, polynomial representation and addition, generalized linked list. [6]
5. **Stack:** Primitive stack operations: push and pop array and linked list implementation of stack, application of stack: prefix and postfix expressions, evaluation of postfix expression, recursion, and tower of Hanoi problem. [4]
6. **Queue:** Queue operations, circular queues, array and linked list implementation of queues, dequeue and priority queue [4]
7. **Tree:** Binary trees, binary tree representation, tree traversal algorithms: inorder, preorder and postorder, threaded binary trees, Huffman algorithm, binary search trees AVL trees. [6]
8. **Graph:** Terminology, sequential and linked representations of graphs: adjacency matrices, adjacency list, adjacency multi list, graph traversal: depth first search and breadth first search, spanning trees. [6]

Outcome(s): On the successful completion of the course, the student will be able to:

- be knowledgeable of certain abstract data types (ADT)
- be able to make a critical assessment of different implementations of an ADT
- be familiar with a number of fundamental computational problems, and be aware of real world instances of those problems

Text Books:

1. Lipschutz, "Data Structures" Schaum's Outline Series, TMH, Revised Edition Feb. 2014

Reference Books:

1.Aaron M. Tenenbaum, YedidyahLangsam and Moshe J. Augenstein, Data Structures Using C and C++, PHI, 2nd Edition, 2012.

2. Horowitz and Sahani, Fundamentals of Data Structures, University Press, 2nd Edition2008.

3. Jean Paul Trembley and Paul G. Sorenson, An Introduction to Data Structures with applications, McGraw Hill, 2nd Edition, 2003.

4. G. A. V. Pai, Data Structures and Algorithms, TMH, 2008

CS -14.205 **C++ Programming** **Total Lectures: 40**
Credit:3-0-0-3

Prerequisite(s): CS-14.101(Programming Language)

Objective(s):

- To get a basic knowledge of object-oriented concepts.
- To master in programming related to classes inheritance using C++.

1. **Object Oriented Programming:** Basic concepts of object-oriented programming, Structured versus object oriented programming, merits and demerits of object oriented methodology. [5]
2. **Beginning With C++:** Preprocessor directives, Variables, data types, constants, operators, scope resolution operator, memory management operators, decision and loop controls, arrays, strings, functions [5]
3. **Classes And Objects:** Class definition, Structure versus class, accessing member functions within a class, data hiding, arrays within a class, static data and member functions, objects, friend functions and friend classes, constant member functions, pointers to members, constructors and destructor [7]
4. **Overloading and Exception Handling:** Definition, unary operator overloading, binary operators overloading, overloading of new and delete operators, manipulation of string using operators, type conversion, overloading with friend functions, function overloading, error and exception handling [8]
5. **Inheritance and Overriding:** Derived and base classes, type of inheritance, Derived class constructors and destructor, overriding member functions, public and private inheritance, virtual base classes, abstract classes, this pointer, virtual functions and pure virtual functions, static and dynamic bindings [8]
6. **I/O Streams and The Standard Library:** Header files, I/O stream library, stream I/O for objects, File I/O. [4]
7. **Templates:** Class templates, function templates, overloaded function templates, member function templates. [3]

Outcome(s): On the successful completion of the course, the student will be able to:

- To gain the basic knowledge on object oriented concepts.
- To understand the role of inheritance, polymorphism, dynamic binding and generic structures in building reusable code.
- To implement features of object oriented programming to solve real world problems.

Text Books:

1. Herbert Schildt, "C++: The Complete Reference "4th edition, TMH July 2017.
2. Robert Lafore, "Object-Oriented Programming in C++", 4th edition, SAMS.

Reference Books:

1. Bjarne Stroustrup,"Programming-Principles and Practice Using C++", Addison-Wesley,4th Edition 2013
2. E. Balagurusamy,"Object Oriented Programming With C++",5thedition 2011, TMH

CS-14.207 **Computer Information Systems** **Total Lectures: 40**
Credit:3-0-0-3

Prerequisite(s): None

Objective(s):
- To give essential knowledge about computer information system and its components

1. **Introduction:** Evolution of computers, generation of computers, classification of computers, block diagram of digital computers, memory unit, ALU,CPU, I/O devices, basic bus architecture, software classification, machine language, assembly languages and high level languages, assembler, compilers and interpreters, process of compilation, programming language generations, introduction to operating systems and role of the operating system. [8]
2. **Digital Logic:** Introduction to Boolean algebra and logic gates, K-map representation and Boolean function simplification, number systems: conversion from one number system to another, binary operations, complement representation of numbers, alphanumeric codes, floating point representation of numbers, floating point arithmetic operations. [6]
3. **Digital Circuit Building Blocks:** Adders, subtractors, comparators, encoders, decoders, multiplexers, de-multiplexers, latches, flip-flops, master slave flip flops, shift registers and counters. [10]
4. **Internet Technologies**: Introduction to computer networks, Internet, WWW and E-mail, web browsers, introduction to LAN,MAN, WAN, introduction to the design of web pages, HTML tags and CSS, web servers, server scripting, XML. [8]
5. **Software Development:** a systematic approach to program design, coding, testing, and debugging, application of these skills to the construction of robust programs, use of programming environments and tools to aid in the software development process. [6]
6. **Computers and Society**: Impact of computers in social life, education, business, issues of security and privacy, computer ethics. [2]

Outcome(s):
- On successful completion of this course, students will be able to take specialized courses with strong fundamentals of Computer Information Systems.

Text Books:

1. P.K. Sinha, Computer Fundamentals, BPB Publications, 6th Edition, 2017
2. M. Morris Mano, Digital Logic & Computer Design, Pearson, 2nd Edition, 2010
3. Roger S. Pressman, Software Engineering: A Practitioner's Approach, McGraw-Hill Higher Education, 8th Edition, 2014
4. Thomas Powell, HTML and CSS: The Complete Reference, Tata McGraw-Hill, 5th Edition, 2010

Reference Books:

1. Andrew S.Tanenbaum, Computer Networks, Pearson Education, 5th Edition, 2013
2. Rajaraman, Fundamentals of Computers, PHI, 6th Edition, 2014

MA 14.201 **Applied Mathematics** **Total Lectures: 40**
Credit:3-1-0-4

Prerequisite(s): None

Objective(s):
- To acquire fundamental knowledge of linear programming, numerical methods, complex analysis and integral transform and apply in engineering disciplines.

1. **Linear Programming:** Introduction**,** graphical method (bounded & unbounded solutions), Simplex method, artificial variable technique (Two phase method, Big –M method); Assignment problem (Hungarian method); Transportation problem (Vogel's approximation method). [12]
2. **Numerical Methods:** Solution of system of equations (Gauss elimination and Gauss – Seidel methods); Solution of algebraic and transcendental equations (Bisection, Ramanujan's and Regula Falsi methods), solution of ordinary differential equation (Euler's modified, Milne's predictor & corrector Runge-Kutta methods) [10]
3. **Complex Analysis:** Function of complex variable, analytic function, Cauchy- Riemann equations (without proof), integration of complex functions, line integrals in the complex plane, Cauchy integral theorem(without proof), Cauchy integral formula (without proof), zeros and singularities of complex functions, residues. [6]
4. **Integral Transform**: Laplace transform and inverse Laplace transform, first and second shifting theorems, convolution theorem (without proof), solution of ordinary differential equations with initial conditions by Laplace transforms, Fourier series of periodic functions, even and odd functions, Fourier half-range series, basics of Fourier transform. [12]

Outcome(s):
- After completion of the course, students would be able to apply the knowledge of linear programming, numerical methods, complex analysis and integral transforms in engineering and solve curriculum problems.

Text Books:

1. Ramana B.V., Higher Engineering Mathematics, TMH,2nd 2007.
2. Grewal B.S. & Grewal J.S., Higher Engineering Mathematics, Khanna publishers, 40th Edition: 2007.

2. Erwin Kreyszig Advanced Engineering Mathematics, 9th Edition, Reprint 2011.
3. James B. Scarborough, Numerical Mathematical Analysis, Oxford & IBH Publishing Co. Pvt. Ltd.
4. Babu Ram, Engineering Mathematics, Pearson, Year 2010.

CS-14.225 **C++ Programming Laboratory** **Credit: 0-0-2-1**

Prerequisite CS14.111 (Programming Language Laboratory)

Objective: The objective of this lab is to provide students with an understanding of the fundamental concepts in object oriented programming and to provide the skills needed for developing the software application.

Contents: Lab manual based upon the theory course CS 14.205 and to achieve the listed course objectives and outcomes

Outcomes: Upon completion of the course students will have knowledge of the underlying the static member, friend function, operator overloading, exception handling, inheritance and polymorphism in object oriented programming application.

CS-14.223 **Data Structures Laboratory** **Credit: 0-0-2-1**

Prerequisite(s): CS-14.111(Programming Language Laboratory)

Objective(s):

- To develop skills to design and analyze simple linear and nonlinear data structures
- To Strengthen the ability to identify and apply the suitable data structure for the given real
- world problem
- To Gain knowledge in practical applications of data structures

Contents: Lab manual based upon the theory course CS 14.203 and to achieve the listed course objectives and outcomes

Outcome(s): At the end of this course, the student will

- Be able to design and analyze the time and space efficiency of the data structure.
- Be capable to identity the appropriate data structure for given problem.
- Have practical knowledge on the application of data structures.

CS 14.227 **Computer Information Systems Laboratory** **Credit: 0-0-2-1**

Prerequisite(s): CS 14.104 (Programming Language Lab.)
Objective(s): To give practical knowledge about computer information system and its components.

Content: Lab manual based upon the theory course CS 14.207 and to achieve the listed course objectives and outcomes

Outcome(s): At the end of this course, the student will be ready to take specialized lab courses with strong fundamentals of Computer Information Systems.

CS-14.202 **Java Programming** **Total Lectures: 40**
Credit: 3-0-0-3

Prerequisite(s): CS 14.101 (Programming Language)

Objective(s): The objective of this course is to:

- cover issues related to the definition, creation and usage of classes, objects and methods.
- discuss the principles of inheritance and polymorphism.
- provide the foundation of good programming skills by discussing key issues of the design of object- oriented software, including programming design and documentation.
- cover the basics of API and to explore the java abstract programming interface.

1. **Overview:** Introduction to Java, importance of Java, interactive Development Environments: Eclipse/Net Beans, basics of OOP. [4]
2. **Data Types, Variable, and Arrays:** Primitive data types, type casting, arrays, operators and control structures, identifiers, constants and literals. [6]
3. **Classes and Objects:** Class fundamentals, declaring objects, assigning object reference variables, introducing methods, constructors, this keyword, garbage collection, the finalize() method, overloading methods, using objects as parameters and return type, introducing access control, understanding static, introducing final, introducing nested and inner classes, exploring the string class, using command-line arguments. [9]
4. **Inheritance:** Inheritance basics, using super, multilevel hierarchy, constructor in hierarchy, method overriding, dynamic method dispatch, using abstract classes, using final in inheritance, the object class. [4]
5. **Package, Interfaces and Exception Handling:** Packages, access protection, importing packages, interfaces, exception-handling fundamentals, exception types, using try and catch, multiple catch clauses, nested try statements, throw, throws, finally, JAVA's built-in exceptions, user defined exception. [6]
6. **Multithreaded Programming:** The Java thread model, the main thread, creating multiple threads, threads priorities, managing threads, thread class built-in functions. [4]
7. **I/O and String Handling:** I/O basics, reading console input, writing console output, the print writer class, reading and writing files, string constructors, operations on string, string tokenizing, string buffer. [7]

Outcome(s): Upon completion of this course, students are able to:

- Understand the concepts of OOP as well as the purpose and usage principles of inheritance, polymorphism, encapsulation and method overloading.
- Identify classes, objects, members of a class and the relationships among them needed for a specific problem.
- Develop programs using the in-built Java API and the Java standard class library.
- Create Java application programs using sound OOP practices (e.g., interfaces and APIs) and proper program structuring (e.g., by using access control identifies, automatic documentation through comments, error exception handling).
- Use of development environment like Eclipse for collaborative programming

Text Books:

1. Herbert Schildt, Java The Complete Reference, Herbert Schildt, 8th Edition, 2011.
2. John Jukowski, Mastering Java, 2002.

Reference Books:

1.Allen B. Downey, Think Java: How to Think Like a Computer Scientist, 2011.
2. Paul Deitel, Harvey Deitel , Java How To Program (Early Objects), 10th Edition, 2014.

CS-14.204 **Database Management Systems** **Total Lectures: 40**
Credit:3-0-0-3

Prerequisite(s): CS 14.207(Computer Information System), CS14.203 (Data Structures).

Objective(s): The objective of this Course is to:

- Understand the fundamental concepts of database management.
- Design and Normalize databases.
- Understand transaction processing control.
- Understand basic of object concepts and object relations.
- Understand the role of the DBMS & RDBMS in the organization.

1. **Introduction:** Databases and database users, database system concepts and architecture, data modeling using the entity-relationship (ER) model, enhanced entity relationship model. [7]
2. **Relational Data Model:** Concepts, relational model constraints, relational database schemas, update operations, dealing with constraint violations, relational algebra operations, relational calculus, mapping ER model to relational model. [7]
3. **Structured Query Language (SQL)**: SQL data definition and data types, specifying constraints, schema change statements, basic queries, complex queries, update statements, views. [4]
4. **Database Design:** Functional dependencies and normalization of relational databases, first normal form (1NF), 2nf, 3nf, boyce-codd normal form (BCNF), multi valued dependency, 4NF, join dependency, 5NF. [8]
5. **Transaction Processing:** Introduction, properties, recoverability, serializability, concurrency control techniques: two phase locking protocol, concurrency control based on time-stamp ordering, database recovery techniques: recovery concepts, recovery techniques based on deferred and immediate update, the ARIES recovery algorithm. [7]
6. **Object and Object-Relational Databases:** Concepts for object databases, object database standards and design, object relational and extended relational systems. [7]

Outcome(s): After completion of the course, students will be able to:

- Analyze database models & entity relationship models. Understand architecture for database development.
- Design E-R diagram
- Use Structured Query Language (SQL) with complex queries.
- Design and normalize the relations for any organization.
- Understand transaction processing control.

Text Books:

1. Ramez Elmasri & Shamkant B. Navathe, Fundamentals of Database Management Systems, Edition, Pearson Education, 2013.

2. Raghu Ramakrishnan, Database Management Systems, 3rd Edition, Tata McGraw Hill, 2008.

1. G.W. Hansen, and J.V. Hansen, Database Management and Design, 2nd Edition, Prentice Hall India, 2000.

2. Korth and Schilberschatz, Database System Concepts, 5th Edition, Tata McGraw Hill, 2006.

3. C.J. Date, Database Systems, Tata McGraw Hill, 2nd Edition, 2003.

MA 14.202 **Statistics and Probability Theory** **Total Lectures: 40**
Credit:3-1-0-4

Prerequisite(s): Nil.

Objective(s):

- To acquire fundamental knowledge of Statistics and Probability and apply in engineering disciplines.

1. **Introductory Ideas:** Recapitulation of Basic Probability theory; Law of addition and law of multiplication ;conditional probability; total probability; Bayes' theorem and it's applications. [6]
2. **Random Variables and Distribution:** Discrete and continuous random variables; types of distribution; probability mass and density functions; mean, variance and standard deviation of distribution. [4]
3. **Theoretical Probability Distribution:** Discrete types (Binomial) and Continuous type (Normal, Student's't'); applications of basic ideas to these distributions [8]
4. **Sampling Theory:** Sampling distribution of mean and variance; central limit Theorem. [4]
5. **Testing of Hypothesis:** Simple and Composite hypothesis; Type I and Type II errors; tests of significance and level of significance. [4]
6. **Correlation and Regression:** Simple, partial and multiple correlations; linear regression. [6]
7. **Queuing Theory and Queuing Models:** Birth and death process; pure birth and pure death process; Classification of queuing models: M/M/1, M/M/1/N, M/M/S and M/M/S/N. [8]

Outcome(s):

- After completion of the course, students would be able to apply the knowledge of Statistics and Probability in engineering and solve curriculum problems.

Text Books:

1. A.P.Baisnab and Manoranjan Jas, Elements of Probability and Statistics, TMH, 2003.
2. Pugalararasu, Probability and Queuing Theory, TMH, 2011.
3. Gupta & Kapoor, Fundamental of Mathematical Statistics, SCS Publisher, 2002.
4. Gupta & Kapoor, Fundamental of Applied statistics, SCS Publisher, 2001.
5. B.V. Ramana, Higher Engineering Mathematics, TMH, 2006.

Reference Books:

1. Papoulis, Probability, Random Variables and Stochastic Processes, TMH, 2002.
2. Palaniammal, Probability and Random Processes, PHI, 2012.
3. Spiegel, Probability and Statistics (Schaum's outline Series), TMH, 2004.
4. Miller and Freund's, Mathematical Statistics with Applications, 7th Edition, Pearson, 2003.
5. Richard A. Jonson, Probability and Statistics for Engineers, Pearson, 2005**.**

CS-14.224 Data Base Management Systems Laboratory Credit: 0-0-2-1

Pre-requisites: CS14.111 (Programming Language Laboratory)

Objective: By the end of the practical sessions of this section, students will be able to:

- Create Databases using a user interface and SQL command.
- Create Integrity and constraints on databases.
- Write SQL queries.
- Provide a practical overview of advanced concepts like triggers, assertion, views, etc.

Contents: Lab manual based upon the theory course CS 14.204 and to achieve the listed course objectives and outcomes

Outcomes: After undergoing this laboratory module, the students should be able to:

- Understand, appreciate and effectively explain the underlying concepts of database technologies.
- Design and implement a database schema for a given problem-domain.
- Populate and query a database using SQL DML/DDL commands.
- Declare and enforce integrity constraints on a database using a state-of-the-art
- RDBMS.
- Programming PL/SQL including stored procedures, stored functions, cursors, packages.

CS-14.222 **Java Programming Lab** **Credit: 0-0-2-1**

.

Prerequisite: CS 14.225(C++ Programming Lab.)

Objectives: The objective of this course is to:

- Become comfortable with object-oriented programming and learn to think in terms of objects.
- Provide the foundation of good programming skills by discussing key issues to the design of object-oriented software, including programming design patterns, documentation.

Contents: Lab manual based upon the theory course CS 14.207 and to achieve the listed course objectives and outcomes

Outcomes: Upon completion of this course, students are able to:

- Understand the concepts of OOP as well as the purpose and usage principles of
- Inheritance, polymorphism, encapsulation and method overloading.
- Create Java application programs
- Use of development environment like Eclipse for collaborative programming/editing.

CS -14.206 **Theory of Computation** **Total Lectures: 40**
Credit:3-1-0-4

Prerequisite(s): CS 14.201(Discrete Structures)

Objective(s): The goal of this course is to

- Provide students with an understanding of basic concepts in the theory of computation.
- To understand variety of issues in the mathematical development of computer science theory, particularly finite representations for languages and machines, as well as gain a more formal understanding of algorithms and procedures.

1. **Finite Automata and Regular Expression:** Finite state systems, basic definitions, regular languages and regular expression, finite automata ,Equivalence of DFA and NDFA , Kleen's theorem, pumping lemma for regular sets, regular expression with algebraic method Using Arden's Theorem, closure properties of regular sets, minimization of finite automata, Mealy and Moore machine - conversion of Mealy machine into Moore machine and vice versa. [11]
2. **Context-Free Grammars:** Context-free grammars, union, concatenation of CFG, derivation trees, simplification of context-free grammars, Chomsky normal form, Greibach Normal form, ambiguous context-free grammar. [9]
3. **Context-Free Languages and Pushdown Automata:** Pushdown automata and context-free languages, pumping lemma for CFL, closure properties of CFL, decision, algorithms for CFL. [8]
4. **Turing Machine:** Turing machine model, techniques for Turing machine construction, Turing machines as language acceptor, combining Turing machines, properties of recursive and recursively enumerable languages, universal Turing machine. [8]
5. **Chomsky Hierarchy of Languages:** Regular grammars, unrestricted grammars and Turing machines, context-sensitive grammars and linear bounded automata. [4]

Outcome(s):

- Be able to prove the equivalence of languages described by finite state machines and regular expressions.
- Be able to construct pushdown automata and the equivalent context free grammars.
- Be able to prove the equivalence of languages described by pushdown automata and context free grammars.
- Be able to construct Turing machines and Post machines.
- Be able to prove the equivalence of languages described by Turing machines and Post Machines.

Text Books:

1. Peter Linz, An Introduction to Formal Languages and Automata, Third Edition, Jones and Bartlett, 2001.
2. Hopcroft, Motwani, Ullmann, Introduction to Automata Theory, Languages and Computation, Pearson Education, Second Edition, 2005.

Reference Books:

1. Daniel I. A. Cohen, Introduction to Computer Theory, Prentice-Hall, Second Edition,1997.
2. Martin, Introduction to Languages and the theory of Computation, Tata McgrawHill, Third Edition, 2006

CS 14.270 **Comprehensive-I**

Credit: 0-0-0-3

Prerequisite(s): CS-14.101(Programming Language),CS-14.203(Discrete Structures),CS-14.205(Data Structures),CS-14.207(Computer Information System), CS-14.202(Java Programming), CS-14.204(Database Management System), CS14.206(Theory of Computation) ,CS-14.232(Computer Organization and Architecture)

Objective(s):

- To examine the understanding of the student in different fields of computer science in concise manner.

1. **Elementary Computer Science:** Software, hardware, firmware, algorithm, coding, data, information, programming methodologies, logic, software development life cycle.
2. **Digital Logic:** Logic functions, minimization, design and synthesis of combinational and sequential circuits; number representation and computer arithmetic (fixed and floating point).
3. **Computer Organization and Architecture:** Machine instructions and addressing modes, ALU and data-path, CPU control design, memory interface, I/O interface (interrupt and DMA mode), instruction pipelining, cache and main memory, secondary storage.
4. **Programming and Data Structures:** Programming in C; functions, recursion, parameter passing, scope, binding; abstract data types, arrays, stacks, queues, linked lists, trees, binary search trees, binary heaps.
5. **Databases:** ER-model, relational model (relational algebra, tupple calculus), database design (integrity constraints, normal forms), query languages (SQL), file structures (sequential files, indexing, B and B+ trees), transactions and concurrency control.
6. **Object Oriented Programming (C++ & Java):** Classes and objects, overloading, inheritance, overriding, polymorphism, exception handling, I/O streams, templates in C++, interfaces and packages in JAVA, multithreading in JAVA
7. **Automata theory:** Finite automata and regular expression, context-free languages and pushdown automata, Turing machine, Chomsky hierarchy of languages.

Outcome(s):

- At the end of this course students should be able to inspect her knowledge precisely acquired in the field of programming, data structures and databases.

CS-14.232 **Computer Organization and Architecture** **Total Lectures: 40**
Credit:3-0-0-3

Prerequisite(s): CS-14.207 (Computer Information System)

Objective(s):

- To have a thorough understanding of the basic structure and operation of a digital computer.
- To discuss in detail the operation of the arithmetic unit including the algorithms &
- implementation of fixed-point and floating-point addition, subtraction, multiplication & division.
- To study the different ways of communicating with I/O devices and standard I/O interfaces. To study the hierarchical memory system including cache memories and virtual memory.

1. **Introduction:** Von-Neuman architecture, register transfer and micro operations: register transfer language, arithmetic micro-operations, logic micro-operations, shift micro- operations, bus and memory transfers, computer organization and design: instruction cycle, computer registers, common bus system, computer instructions, addressing modes, design of a basic computer. [8]
2. **Central Processing Unit:** General register organization, stack organization, instruction formats, data transfer and manipulation, program control, RISC, CISC characteristics, pipeline and vector processing: pipeline structure, speedup, efficiency, throughput and bottlenecks, arithmetic pipeline and instruction pipeline [8]
3. **Computer Arithmetic:** Hardware implementation of addition and subtraction, multiplication algorithms, Booths multiplier, array multiplier, division algorithms, floating point arithmetic: floating point representation, add, subtract, multiplication, division. [8]
4. **Memory & I/O Organization:** Memory hierarchy, RAM, ROM chips, memory address map, memory connection, associative memory, cache memory and virtual memory: paging and segmentation, auxiliary memory: magnetic disks, magnetic tapes, Input-output interface, Asynchronous data transfer, modes of transfer, priority interrupt, DMA, IOP. [8]
5. **Hardwired and Microprogrammed Control:** Hardwired control, microprogrammed control: microinstruction, microprogram sequencing, wide-branch addressing, microinstruction with next-address field, prefetching microinstruction. [6]
6. **Advance Topics:** Case study on Pentium series processors. [2]

Outcome(s): On the successful completion of the course, the student will be able to:

- Understand basic structure of a digital computer.
- Perform arithmetic operations of binary number system.
- Know the organization of the control unit, arithmetic and logical unit, memory unit and the
- I/Ounit.

Text Books:

1. M. Morris Mano, Computer System Architecture, Pearson Education, 3rd edition, 2008.
2. Carl Hamacher, ZvonkoVranesic and SafwatZaky, Computer Organization, Tata McGraw Hill, 5th edition, 2002.

Reference Books:

1. Patterson and John L. Hennessy, Computer Organization and Design: The Hardware/ Software interface, Elsevier, 3rd edition, 2005.
2. William Stallings, Computer Organization and Architecture – Designing for Performance, Pearson Education, 6th edition, 2000.
3. John P. Hayes, Computer Architecture and Organization, Tata McGraw Hill,3rd edition,1998.

CS-14.301 **Design and Analysis of Algorithms** **Total Lectures: 40**
Credit:3-1-0-4

Prerequisite(s): CS-14.201(Discrete Structures), CS-14.203(Data Structures)

Objective(s):
- To learn the algorithm analysis techniques.
- To become familiar with the different algorithm design techniques.
- To understand the limitations of the algorithms power.

1. **Introduction:** Fundamentals of algorithms and problem solving, asymptotic notations, time complexity and analysis of algorithms, solutions of recurrence relations, master theorem and summations techniques. [8]
2. **Analysis of Sorting and Searching Algorithms:** Linear, binary and interpolation search, insertion, selection, merge, quick and heap sort, stability and other issues, hashing. [8]
3. **Algorithm Design Approaches:** Greedy method (knapsack problem, job sequencing problem), dynamic programming (assembly line scheduling, matrix chain multiplication), backtracking (8 queens problem, sum of subsets), branch and bound (0/1 knapsack problem), divide and conquer algorithms (Strassen matrix multiplication), problems based on these design paradigms. [8]
4. **Tree and Graph algorithms:** Spanning trees, Prim and Kruskal's algorithm, Huffman coding, BFS and DFS, disjoint set operations, connected components, shortest path algorithms in a graph such as Dijkstra, Bellman Ford, Warshall's etc. [8]
5. **Complexity Classes:** P,NP,NP hard and NP complete problems, reducibility, decision and optimization problems, examples of NP complete problems such as 3 CNF, clique, vertex cover and traveling salesman problem, basic introduction of approximation algorithms. [8]

Outcome(s): On the successful completion of the course, the student will be able to:
- Design algorithms for various computing problems.
- Analyze the time and space complexity of algorithms.
- Critically analyze the different algorithm design techniques for a given problem.
- Modify existing algorithms to improve efficiency.

Text Books:
3. Thomas H.Cormen, Charles E.Leiserson, Ronald L. Rivest and Clifford Stein, Introduction to Algorithms, PHI Learning Private Limited, 3rd edition, 2016.
4. Ellis Horowitz, SartajSahni, SanguthevarRajasekaran, Computer Algorithms, Silicon Press, 2nd edition, 2008.

Reference Books:
3. Anany Levitin, Introduction to the Design and Analysis of Algorithms, Pearson Education, 3rd edition, 2012.
4. Alfred V. Aho, John E. Hopcroft and Jeffrey D. Ullman, Data Structures and Algorithms, Pearson Education, 1st edition, 2006.
5. Donald E. Knuth, The Art of Computer Programming, Volumes 1& 3, Pearson Education, 2009.
6. Steven S. Skiena, The Algorithm Design Manual, Springer, 2nd edition, 2008.

CS-14.303 **Operating System** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS-14.207 (Computer Information System)

Objective(s):

- Understand the fundamental operating system abstractions like processes, threads, files, semaphores, IPC and deadlocks.
- Understand operating system from user's perspective as well as from system's perspective.
- Understand the principles of concurrency and synchronization.
- Understand basic resource management techniques.
- Understand different theoretical principles in depth through hands on high level programming.

1. **Overview:** Definition, types of operating systems: mainframe, server, multiprocessor, personal computer, real-time, embedded and smart card, system calls and utilities, batch, multiprogramming and multitasking operating system. [3]
2. **File Systems:** File concept, user and system programmer view of file systems, different modules of a file system, disk structure, disk-space allocation methods: contiguous, linked, indexed directory structures, file protection, disk scheduling algorithms. [6]
3. **Process Management:** Process concepts, threads, scheduling concepts, types of schedulers, scheduling algorithms, process state diagram, comparison of various CPU scheduling algorithms, multi-level queue scheduling. [6]
4. **Memory Management:** Logical and physical address spaces, base, limit and relocation registers, address binding, dynamic loading and linking, partitioning, swapping, contiguous memory allocation, non-contiguous memory allocation: segmentation, paging and segmentation. [8]
5. **Process Synchronization and deadlock:** Independent and concurrent processes, shared memory approach and message passing approach, mutual exclusion, synchronization, inter process communication, critical section problem and its solution to semaphores: binary and counting semaphores, wait/signal operations and their implementation, classical problems of synchronization, deadlock. [11]
6. **Case Studies:** Windows, UNIX and Linux: scheduling and memory management. [6]

Outcome(s): On successful completion of this course, students will be able to

- Analyze the primary functionalities of operating system.
- Manage system resources efficiently as an operating system designer.
- Develop new operating systems as well as work on existing ones to develop them further.

Text Books:

1. Galvin, Silberschatz, Gagne, Operating System Concepts, Wiley India, 9th edition, 2015.

Reference Books:

1. Andrew S. Tanenbaum, Modern Operating Systems - Prentice-Hall, Inc., 4th edition, 2015.
2. Deitel, Operating Systems, Pearson Education , 3rd edition, (2012 reprint).
3. **Stallings, Operating Systems: Internals and Design Principles, Pearson education, 7th edition 2013.**

CS-14.305 **Logic in Computer Science** **Total Lectures: 40**
Credit: 3-0-0-3

Prerequisite(s): CS-14.201(Discrete Structures), CS-14.207(Computer Information Systems)

Objective(s):

- To introduce the main notions of mathematical logic: logical notations (syntax) and how to assign meaning to them (semantics).
- To study formal frameworks (in the sense of being rigorous as well as in the sense of manipulating "form") for constructing logical arguments (proof theory).
- To study some deductive systems for propositional and first-order logic.
- To introduce the concept of fuzzy logic.

1. **Introduction:** Role of logic in computer science, problem representation, review of the principle of mathematical induction, the principle of structural induction, review of Boolean algebra, language, models, interpretations, validity, proof, decision problems in logic, decidability. [6]
2. **Propositional Logic:** Syntax, semantics, logical and algebraic concepts, identities and normal forms, tautology checking, propositional satisfiability, propositional resolution and tableaux method. [10]
3. **First Order Predicate Logic:** Quantifiers, first order models, validity and satisfiability, forward and backward chaining, Skolmization, normal forms, unification, Horn formulas and programs, resolution and tableaux. [12]
4. **Binary Decision Diagrams:** Representing Boolean functions, algorithms for ordered reduced binary decision diagram (OBDD), geometric templates from spatial relations, image based rendering, symbolic model checking, relational Mu-calculus, coding CTL models and specification [8]
5. **Fuzzy Logic:** Classic sets, fuzzy sets and membership, fuzzy set operations, Cartesian product, operations and properties of crisp relationship, operations and properties of fuzzy relationship. [4]

Outcome(s): On successful completion of this course, the students will be able to

- Use propositional and first-order logic.
- Apply of logic in specifying properties.
- Develop proof by induction.
- Design binary decision diagrams.
- Identify the scope for fuzzy logic.

Text Books:

2. M. Ben-Ari, Mathematical Logic for Computer Science, Springer, 2nd edition, 2003.
3. Rich E., and Knight K., Artificial Intelligence, Tata McGraw-Hill, 3rd edition, 2009.
4. C. L. Chang and R. C. T. Lee, Symbolic Logic and Mechanical Theorem Proving, Academic Press, 1st edition, 1973.

CS 14.309 **Microprocessor and Assembly Language Programming** **Total Lectures: 40**
Credit: 3-0-0 -3

Prerequisite(s): CS 14.207 (Computer Information System)

Objective(s):
- To study architecture and memory management of 8-bit and 16-bit microprocessor (8085 & 8086)
- To study assembly language programming and use it to solve various problems.

1. **Introduction:** Evolution of Microprocessor and its types, 8085 microprocessor architecture, buses, registers, flags, 8085 pin configuration & function. [6]
2. **8085 Instruction Set:** Addressing modes of 8085, 8085 instruction set, data transfer arithmetic, logical and branch instructions, 8085 interrupt structure, limitations of 8085 microprocessor. [8]
3. **Interfacing:** Memory mapped I/O, I/O mapped I/O, address decoding, interfacing of memory with 8085, interfacing of I/O with 8085. [8]
4. **Advance Microprocessors:** 8086 microprocessor architecture, 8086 pin configuration & function, addressing modes of 8086, instruction set of 8086, 8086 interrupts, study of advance processors of the family (8088, 80286, 80386, 80486 and Pentium). [10]
5. **Assembly Language Programming:** Introduction, assembler directives, looping, condition and jump, subroutines, procedures, macros, parameter passing. [8]

Outcome(s): On successful completion of this course, students will be able to:
- Draw block diagram of 8085/86 processor and know the pin function
- Know the instruction set and addressing modes
- Write the assembly language program for different problems and know the use of procedures and macros.
- Design interface of memory chips.

Text Books:
1. **Gaonkar R. S., "Microprocessor Architecture, Programming and Applications", 6th Ed., Penram International, 2013.**

3. Ray, A.K. and Bhurchandi, K.M., "Advanced Microprocessor and Peripherals Architecture, Programming and Interfacing", Tata Mc-Graw Hill, 2006
4. Chhabra, "The Intel 8086/8088 microprocessor architecture programming design & interfacing", Dhanpat Rai Publication

MT 201 **Engineering Economics** **Total Lectures: 24Credit: 2-0-0-2**

Prerequisite(s): NIL

Objective(s):

- To know about the basic concepts of Engineering Economics and its role in Indian economy.
- To understand about the elements of economics with application to the industrial sector and its impact on Economy.
- To discuss about the market demand analysis, production analysis and pricing mechanism for decision making.
- To find the role of consumer perception in market demand and its features and infrastructure development in India.
- To discuss about cost analysis and optimization techniques with multiple objectives.

1. **Introduction to Engineering Economics:**Origin, principles, engineering economics and design process, engineering for economic competitiveness, engineering economy and the engineer. [3]
2. **Elements of Economics:**Definition, demand and supply, income, equilibrium, utility. [3]
3. **Economics applied to Industries:**Market demand analysis, production analysis for decision Making, cost analysis, pricing techniques in regards of goods and services, break even analysis, interest, annuities and profits. [12]
4. **Replacement Analysis:**Capital recovery, depreciation methods for replacement studies. [2]
5. **Optimization Techniques:**Economics and optimization, price mechanism and optimal resource allocation, optimization under constraints, optimization under risk and uncertainty, [4]

Outcome(s): Students would

- Be able to perform and evaluate payback period and capitalized cost on one or more than one economic alternatives.
- Be able to carry out and evaluate the benefit/cost, break even analysis on one or more alternatives.
- Have the knowledge of fundamentals of Engineering Economics for the purpose of economic condition of the country.

Text Books:

1. **Salvetore Dominick, Managerial Economics, Prentice Hall of India,6th Edition, 2008.**
2. **Christopher Thomas, S Charles Maurice, Managerial Economics, Mc-Graw Hill,11th Edition, 2012.**

Reference Book:

1. **Van Horne,James C., Fundamentals of Financial Management, Pearson Education,13thEdition, 2009.**

CS 14.315 **Python Programming** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): Programming Language (CS 14.101)

Objective(s): Python is a general-purpose, versatile and popular programming language. It's great as a first language because it is concise and easy to read, and it is also a good language to have in any programmer's stack as it can be used for everything from web development to software development and scientific applications.

5. **Introduction**: The basic elements of python, python syntax, compiled vs interpreted languages, formal and natural languages, built in python types, python as a calculator, basic input, branching programs, control structures, strings, tuples, lists and input iteration. [6]
6. **Functions and Abstraction**: Functions and scoping flow of execution, specifications, recursion, global variables, modules, stack diagrams, files, system functions and parameters, input and output, making your own module. [7]
7. **Structured Types and Higher-Order Functions**: Mutability strings, tuples, lists and dictionaries, lists and mutability, functions as Objects. [5]
8. **Classes and Object-Oriented Programming and Data Structure**: Abstract data types and classes, inheritance, encapsulation and information hiding, simple algorithms and data structures, list, tuple, sequence, set, search algorithms, sorting algorithms, hash tables. [8]
9. **Testing and Debugging**: Exceptions and assertions, types of testing – black-box and glass-box, debugging, handling exceptions, assertions. [6]
10. **Advance Python:** Regular expressions – REs and Python, plotting using PyLab, networking and Multithreaded Programming – sockets, threads and processes, chat Application, security – encryption and decryption, classical cyphers, graphics and GUI programming – drawing using Turtle, Tkinter and Python, Other GUIs. [8]

Outcome(s): Upon completion of this course students will be

- Familiar with Python syntax.
- Able to use python to implement a given logic.

Text Books:

1. John V Guttag, Introduction to Computation and Programming using Python, Prentice Hall of India, 2nd Edition, 2013.
2. Swaroop C H. , A Byte of Python, URL: https://python.swaroopch.com

Reference Books:

1. Zed A. Shaw ,Learn Python the hard way: a very simple introduction to the terrifyingly beautiful world of computers and code, Third edition, 2014.
2. Richard L. Halterman,Learning to Program with python, 2011.
3. Allen Downey ,Think Python How to Think Like a Computer Scientist, Version 2.0.17, Green Tea Press Needham, Massachusetts,2012.

CS-14.317 **Advance Web Technology** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 14.207 (Computer Information System)

Objective(s):

- To learn the platform neutral fundamentals of secure, dynamic web application development.
- To learn how to implement a web application using one specific set of open source server side tools: PHP and MySQL.

1. **Introduction:**HTTPprotocol:request and response, web browser and web servers, concepts of effective web design, web design issues including browser, bandwidth and cache, display resolution, look and feel of the website, page layout and linking, user centric design, sitemap, planning and publishing website, designing effective navigation. [4]

2. **JavaScript and XML:** Client side scripting with JavaScript, variables, functions, conditions, loops and repetition, pop up boxes, advance JavaScript: JavaScript and objects, JavaScript own objects, the DOM and web, browser environments, manipulation using DOM, forms and validations, Introduction to XML, uses of XML, simple XML, XML key components, DTD and Schemas, using XML with application, transforming XML using XSL and XSLT. [12]

3. **PHP:** Introduction and basic syntax of PHP, decision and looping with examples, PHP and HTML, arrays, functions, browser control and detection, string, form processing, files, advance features: Cookies and sessions, Object Oriented Programming with PHP. [12]

4. **PHP and MySQL:** Basic commands with PHP examples, connection to server, creating database, selecting a database, listing database, listing table names, creating a table, inserting data, altering tables, queries, deleting database, deleting data and tables, PhpMyadmin and database bugs. [12]

Outcome(s): Upon completion of the course students will be able to:

- Use the JavaScript to develop the dynamic web pages.
- Use server side scripting with PHP to generate the web pages dynamically using the database connectivity.
- Develop the modern Web applications using the client and server side technologies and the web design fundamentals.

Text Books:

1. Luke Welling, Laura Thomson: PHP and MySQL Web Development, Pearson, 2016.
2. Robin Nixon: Learning PHP, MySQL, and JavaScript, O'Reilly Media, 2012.

Reference Books:

1. Elizabeth Naramore, Jason Gerner, Yann Le Scouarnec, Jeremy Stolz, MichaelK. Glass, Beginning PHP5, Apache, and MySQL Web Development, Wrox, 2005.
2. Developing Web Applications in PHP and AJAX, Harwani, McGrawHill, 2010.
3. W. Jason Gilmore: Beginning PHP and MySQL 5 From Novice to Professional, Apress, 2010.

CS- 14.319 **Advanced Java** **Total Lectures: 40Credit: 3-1-0-4**

Prerequisite(s): CS 14.202 (Java)

Objective(s): This course extends the study of Web Programming Fundamentals. Advanced concepts of program design, implementation and testing will be introduced with J2EE framework. Student will learn various concept of advance Java for implementation of small to medium sized application programs that illustrate professionally acceptable coding and performance standards.

1. **Introduction:** OOPS principle, class and objects, basics of HTML, web development introduction, web framework, J2EE building blocks, web application structure [3]
2. **Servlets:** Servlet needs, servlet request-response model, servlet life cycle (init, service, doGet, doPost), servlet configuration, scopes (session, request, page), servlet parameters, servlet context, forms processing (get, post), HTTP header processing, HTTP responses. [5]
3. **Java Server Pages**: JSP life cycle, JSP a servlets, creating dynamic content with use of JSP elements: expressions, scriptlets& declarations, JSP composition, redirecting, forwarding, accessing default objects (request, response, session, application, config, pageContext), error processing with use of JSP, Servlets vs. JSP pages [8]
4. **Session management**: Http session, the Http session interface session tracking: cookies, hidden fields, cookies and JSP, sending and receiving cookies. [4]
5. **Using Beans and tag libraries**: Separating presentation and business logic, JSP actions, JavaBeans, working with properties, <jsp:useBean>, <jsp:getProperty> and <jsp:setProperty>,using form parameters with Beans, custom tags, types of tags. [10]
6. **Web application:** Case study of a web application, the web.xml deployment descriptor, web.xml – document definition, web.xml – adding servlets, web.xml – mapping servlets, web.xml – sending parameters, web.xml – pre-loading servlets, web application archive, deployment of web application [10]

Outcome(s): Upon successful completion of this course you should be able to:

- Demonstrate knowledge of the advance Java along with object oriented development process and apply this understanding to the analysis and design of solutions for small to medium scale problems.
- Implement web application using all the feature of J2EE covered in the course.

Text Books:

1. By Martin Bond, Debbie Law, Andy Longshaw, Dan Haywood, Peter Roxburgh, Sams Teach Yourself J2EE in 21 Days, 2nd Edition,SAMS , 2004.
2. Phillip Hanna , Osborne, JSP 2.0: The Complete Reference, 2nd edition, McGraw-Hill,2003.

Reference Book:

1. Bryan Basham, Kathy Sierra & Bert Bets, Head First Servlets and JSP, 2nd Edition, , Oreilly publication, 2008.

CS-14.321 **Windows Programming** **Total Lectures:40**
Credit : 3-1-0-4

Prerequisite(s): CS-14.101(Programming Language)

Objective(s):

- To provide knowledge of windows programming using Visual Basic .NET.
- To focus on Visual Basic program structure, language syntax and implementation details.

1. **Overview of Windows Programming:** The Windows environment, history of Windows, aspects of Windows, Windows programming options, APIs and memory [4]

models, programming environment

2. **Visual Basic 2010:** The Visual Studio development environment, writing the code, building and deploying the application, working with Toolbox control,working with specific data types, working with operators, if…then structure, select case structure, the for…next loop, using counter variable, complex for…next loop, do loops, using timer object, processing errors by using try…catch statement, using finally clause, the exception object, using nested try…catch, the exit try statement. [12]
3. **Modules and Procedures:** Working with modules, creating public variables, creating procedures, writing sub procedure, passing arguments by value,working with array, using ReDim, the array class, working with object collections, for each…next loop, creating your own collection. [8]
4. **Designing User Interface:** Managing windows forms and controls at run time, adding graphics, the system drawing namespace, adding animation to your program, inheriting forms and creating base classes, working with printers. [6]
5. **Database:** Exploring text files, reading and writing text files, getting started with ADO.NET, SQL statements and LINQ, data presentation using DataGridView control. [6]
6. **Web Programming:** Creating websites and webpages using Visual Web Developer and ASP.NET, difference between webpages and web forms, server controls, HTML controls, using webpage designer, adding server controls to a webpage. [4]

Outcome(s): Upon completion of the course the student should be

- Able to analyze program requirements.
- Design/develop programs with GUI.
- Code program and develop interface using Visual Basic .NET.
- Perform tests, resolve defects and revise existing code.

Text Books:

1. Michael Halvorson, Microsoft Visual Basic 2010, Microsoft Press, 2010
2. Bradley and Millspaugh, Programming in Visual Basic 2010, Mcgraw-Hill, 2010

Reference Books:

1. Shelly Hoisington, Microsoft Visual Basic 2010 for Windows, Web, Office and Database Applications: Comprehensive, Cengage Learning, 2010.
2. Sheldon Bill et. al., Professional Visual Basic 2010 and .NET 4, John Wiley & Sons, 2010
3. Andrew Moore, Visual Studio 2010 All-in-one for Dummies, John Wiley & Sons, 2010

CS -14.323 **Shell Programming** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): Programming Language (CS 14.101)

Objective(s):
- To familiarize students with the Unix/Linux environment
- To learn the fundamentals of shell scripting/programming
- To familiarize students with basic Unix/Linux administration

1. **UNIX-Basic Concepts:** Introduction, file systems, visual editors, Unix philosophy and features, understanding the Unix commands and general purpose utilities and navigating the file system, the shell and kernel. [8]

2. **UNIX-Advanced Features:** File and directory structures, file systems and peripheral devices, handling ordinary files, file attributes. UNIX system administration, data blocks and i-nodes. [8]

3. **Unix Editors and Filters:** Vi Editor, simple filters, regular expression and grep family, advanced filters: sed and awk, awk pattern scanning and processing, awk arithmetic, operators and variables. [8]

4. **Shell Fundamentals:** Command syntax, Shell variables, pattern matching, escaping, command substitution, input /output redirection, pipes, tees, [6]

5. **Shell Scripting:** Bourne shell, C shell; scripts, meta characters and environment, shell programming and scripts, logical operators, control and looping statements and programs. Shell reliability, maintainability, efficiency, portability and usability. [10]

Outcome(s): After completion of the course students will be able to
- Work confidently in Unix/Linux environment
- Write shell scripts to automate various tasks
- Master the basics of Unix/Linux administration
- Understand the basic difference between high level programming and shell programming

Text Books:
1. Sumitabha Das, UNIX, Tata McGraw-Hill Companies, 4th edition, 2011.
2. **Cameron Newham, Learning the bash Shell:Unix Shell Programming, 3rdedition,O'Reilly Media,2009.**

Reference Books:
1. 1. Bill Rosenblatt , Learning the Korn Shell, O'Reilly Media, 2002.
2. 2**.** Mark G. Sobell **,**A practical guide to Linux commands, editors, and shell programming, 2nded. Prentice Hall, 2013.

ET 465 **Agile Software Development** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS14.332 (Software Engineering)

Objective(s):

- To learn the fundamental principles and practices associated with each of the agile development methods.
- To learn how agile methods scale to large and distributed projects.
- To learn the essentials of collaboration as they apply to agile methods.
- To perform in-depth explorations into aspects of agile development that are particularly relevant to each student through detailed discussion sessions.

1. **Fundamentals of Agile:** The genesis of Agile, introduction and background, Agile manifesto and principles, overview of Scrum, extreme programming, feature driven development, lean software development, Agile project management, design and development practices in Agile projects, test driven development, continuous integration, refactoring, pair programming, simple design, user stories, Agile testing, Agile tools. [7]
2. **Agile Scrum Framework:** Introduction to Scrum, project phases, Agile estimation, planning game, product backlog, sprint backlog, iteration planning, user story definition, characteristics and content of user stories, acceptance tests and verifying stories, project velocity, burn down chart, sprint planning and retrospective, daily scrum, Scrum roles – product owner, Scrum master, Scrum team, Scrum case study, tools for Agile project management. [9]
3. **Agile Testing:** The Agile lifecycle and its impact on testing, test driven development (TDD), unit framework and tools for TDD, testing user stories – acceptance tests and scenarios, planning and managing testing cycle, exploratory testing, risk based testing, regression tests, test automation, tools to support the Agile tester, securing Agile software. [10]
4. **Agile Software Design and Development:** Agile design practices, role of design principles including single responsibility principle, open closed principle, Liskov substitution principle, interface segregation principles, dependency inversion principle, Agile design, need and significance of refactoring, refactoring techniques, continuous integration, automated build tools, version control. [10]
5. **Industry Trends:** Market scenario and adoption of Agile, Agile ALM, roles in an Agile project, Agile applicability, Agile in distributed teams, business benefits, challenges in Agile, risks and mitigation, Agile project on cloud, balancing Agility with discipline, Agile rapid development technologies. [4]

Outcome(s): On successful completion of this course, students will be able to

- Understand concept of agile software engineering and its advantages in software development. Recognize various agile methods.
- Design and manage a project using Scrum.
- Write user stories for project requirements.
- Write test cases for developing features.

Text Books:

1. Ken Schawber, Mike Beedle, Agile Software Development with Scrum, Pearson, 2008.
2. Robert C. Martin, Agile Software Development Principles, Patterns and Practices, Prentice Hall
3. Lisa Crispin, Janet Gregory, Agile Testing: A Practical Guide for Testers and Agile Teams, Addison Wesley.

Reference Books:

1. Alistair Cockburn, Agile Software Development: The Cooperative Game, Addition Wesley, 2006
2. Mike Cohn, User Stories Applied for Agile Software, Addison Wesley, 2004

CS-14.351 **DAA Laboratory** **Credit: 0-0-4-2**

Prerequisite(s): CS14.111(Programming Language Laboratory)

Objective(s):

- To analyze the asymptotic performance/Time complexity of algorithms.
- To demonstrate familiarity with major algorithms and data structures.
- To apply important algorithmic design paradigms, techniques and methods for the solution of real life problems.
- To synthesize efficient algorithms in common engineering design situations.

Contents: Lab manual based upon the theory course CS 14.301 and to achieve the listed course objectives and outcomes.

Outcome(s): On successful completion of this course, the students will be able to

- Evaluate and compare different algorithms using worst-, average-, and best-case analysis.
- Describe the divide-and-conquer paradigm and explain when an algorithmic design situation calls for it. Recite algorithms that employ this paradigm. Synthesize divide-and-conquer algorithms. Derive and solve recurrences describing the performance of divide-and-conquer algorithms.
- Describe the dynamic-programming paradigm and explain when an algorithmic design situation calls for it. Recite algorithms that employ this paradigm. Synthesize dynamic-programming algorithms, and analyze them.
- Describe the greedy paradigm and explain when an algorithmic design situation calls for it. Recite algorithms that employ this paradigm. Synthesize greedy algorithms, and analyze them.
- Explain the major graph algorithms and their analysis. Employ graphs to model engineering problems, when appropriate. Synthesize new graph algorithms and algorithms that employ graph computations as key components, and analyze them.
- Explain the different ways to analyze randomized algorithms (expected running time, probability of error). Recite algorithms that employ randomization. Explain the difference between a randomized algorithm and an algorithm with probabilistic inputs.
- Understand the difference between tractable and intractable problems, and to deal with them in approximation for finding the practical solutions.

CS-14.353 **Operating System Laboratory** **Credit: 0-0-2-1**

Prerequisite(s): CS14.111(Programming Language Lab.) CS 14.223(Data Structures Lab)

Objective(s):

- Learn basic operating system abstractions like process, file, page etc. through hands on programming.
- Comprehend problems of resource sharing in operating system and develop software solutions for the same.
- Work in groups to come out with solutions that require collective application of skills learnt.

Lab manual based upon the theory course CS 14.303 and to achieve the listed course objectives and outcomes.

Outcome(s): On successful completion of this course, the students will be able to

- Simulate different operating system scenarios like, process scheduling, memory management, disk scheduling, page replacement and deadlocks.
- Comprehend real life issues in operating system design and would design software level solutions for the same.
- Work in a group to come out with piecemeal solutions individually for a large problem in operating system and would be able enough to make handshaking between different modules to develop a single solution for the same.

CS 14.359 **Microprocessor and Assembly Language Programming Laboratory** **Credit: 0-0-2 -1**

Prerequisite(s): CS 14.227 (Computer Information Systems Laboratory)

Objective(s):

- To implement programs in assembly language
- To debug assembly language programs

Content: Lab manual based upon the theory course CS 14.309 and to achieve the listed course objectives and outcomes.

Outcome(s): On successful completion of this course, students will be able to:

- Solve basic arithmetic operations using the assembly language
- Write program to find smallest/largest number
- Use stack for solving various problems
- Use program counter, status register and show how these are used to execute machine code programs

CS-14.371 **Colloquium** **Credit: 0-0-0-1**

Prerequisite(s): NIL

Objective(s):

- To observe and analyze some popular technology and gain insights
- To comprehend the acquired knowledge.
- To present the acquired knowledge to larger audience.

Content: Students have to comprehend and present on some popular technology in the field of computing.

Outcome(s): On successful completion of this course, the students will be able to

- Communicate effectively to arrange of audience.
- Recognize the need for continuous learning.
- Recognize the social impact of engineering solutions.

CS-14.332 **Software Engineering** **Total Lectures:40**

Credit:3-0-0-3

Prerequisite(s): CS-14.101 (Programming Language), CS-14.203 (Data Structures)

Objective(s):

- To understand the basic software engineering approaches, software development process models, project planning, software size estimation, software effort and cost estimation and risk management.
- To know about software requirements specification, requirement elicitation, structured system analysis and introduction of object-oriented analysis and design, design techniques.
- To acquire knowledge on implementation issues such as modularity and coding standards.
- To learn coding style guidelines and standard and software testing, different type of testing strategies and their application in real time system.
- To study web based-system and application, software re-use, software re-engineering, agile software engineering, software engineering and testing tools.
- To develop teamwork and have project based experience.

1. **Introduction:** Programs versus software products, software crisis, need for software engineering, attributes of effective software, software myths, software characteristics, and role of management in software development, overview of quality standards like ISO 9001, SEI-CMM. [6]

2. **Software Processes and Requirement Analysis:** Software engineering: a layered technology, the software process, software process models, component based development, problem analysis, requirement engineering, requirement elicitation, requirement analysis, software requirement and specifications, data flow diagrams, data dictionaries, entity-relationship diagrams. [8]

3. **Software Project Planning:** Responsibilities & skills of a project manager, project planning, and project size estimation: LOC, function point & feature point metric, project estimation techniques, COCOMO model, staffing level estimation, scheduling, risk management, software configuration management. [9]

4. **Software Design:** The design process, design principles, design concepts, effective modular design: cohesion & coupling, classification of cohesiveness & coupling, design notations, design techniques, structure charts, introduction to object-oriented design. [8]

5. **Coding and Testing:** Software testing fundamentals, test case design, white box testing:-basis path testing, control structure testing, black box testing: boundary value analysis, equivalence class testing, decision table testing, cause effect graphing, level of testing, debugging, testing tools &standards, testing for client/server architecture, real time systems and GUIs testing. Brief of software re-use, reverse engineering, software re-engineering, agile software engineering. [9]

Outcome(s):

On successful completion of this course, students will be able to

- Demonstrate knowledge of the distinction between critical and non-critical systems and ability to manage a project including planning, scheduling and risk assessment/management.
- Author a software requirements document and understanding of the proper contents of a software requirements document.
- Demonstrate proficiency of different life cycle models.
- Identify specific components of a software design that can be targeted for reuse.
- Demonstrate proficiency in software development cost estimation, software testing plan and advanced topics of software engineering.

Text Books:

1. R. S. Pressman, Software Engineering – A practitioner's approach,Tata-McGraw- Hill Int. Ed., 8th edition, 2014.
2. K. K. Aggarwal, Yogesh Singh, Software Engineering, New Age International, 1st edition, 2008.

Reference Books:

1. Pankaj Jalote, An Integrated Approach to Software Engineering, Narosa Publisher, 3rdedition, 2005.
2. Rajib Mall, Fundamentals of Software Engineering, Prentice-Hall, 2ndedition, 2004.
3. Robert C. Martin, Agile Software Development, Principles, Patterns and Practices, 1st edition, 2002.

CS-14.336 **Computer Networks** **Total Lectures: 40**
Credit: 3-0-0-3

Prerequisite(s): CS-14.203 (Data Structures), CS-14.207 (Computer Information Systems)

Objective(s):

- To become familiar with layered communication architectures (OSI and TCP/IP).
- To understand the client/server model and key application layer protocols.
- To construct large-scale computer networks
- To understand fundamentals of computer networks and major protocols.
- To analysis and evaluate major Internet protocols.
- To program simple network applications using socket API
- To learn and adopt newly introduced computer network technologies by themselves.

1. **Introduction to Network Model:** History and development of computer networks, networks topologies, MANET, categories of networks, layering and protocols. [5]
2. **Physical Layer:** Different types of transmission media, transmission impairments, encoding schemes (NRZ, NRZI, Manchester, 4B/5B, Manchester etc.), packet and circuit switching. [5]
3. **MAC Layer:** Aloha, CSMA/CA, CSMA/CD protocols, performance evaluation and characteristics. [3]
4. **Data Link Layer:** Framing concept, error detection (parity, CRC), sliding window, stop and wait protocols, stop performance and efficiency. [5]
5. **Local Area Network:** IEEE 802.3, 802.4, 802.5, 802.11, performance evaluation. [5]
6. **Network Layer:** IPv4, IP address classes, classless addressing, IPv6, ARP, RARP, DHCP, ICMP, routing algorithms: distance vector, metrics, RIP, OSPF, BGP, congestion control algorithms, leaky bucket, token bucket. [8]
7. **Transport Layer:** Duties of the transport layer, connection, TCP, TCP services, TCP header, UDP, evaluating protocol such as TCP/UDP using simulator like NS2. [5]
8. **Application Layer:** DNS, FTP, HTTP, SMTP, POP, basics of network security (cryptography, digital signature and firewall). [4]

Outcome(s): On successful completion of this course, students will be able to

- Analyze computer network component and devices.
- Synthesize how communication works in a network and internet.
- Formulate the concept of topologies and their applications.
- Analyze protocol at different layers and how they play important role in network implementation.
- Identify and analyze the latest technology with existing one.
- Enumerate the layers of OSI and TCP/IP models.
- Configure network and wireless technology including client/server programming.

Text Books:

1. Tanenbaum A. S., Computer Networks, Prentice-Hall of India, 5th edition, 2010.
2. Stallings W., Data and Computer Communications, Prentice-Hall of India, 10th edition, 2013.

Reference Books:

1. **Forouzan B. A., Data Communications and Networking, Tata McGraw-Hill, 5th edition, 2013.**
2. Hayes J. F., Modeling and Analysis of Computer Communication Networks, Plenum Press, 1st edition, 1987.

CS-14.316 **Computer Graphics** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): CS-14.101 (Programming Languages), MA-14.101 Mathematics I

Objective(s):

- To introduce the students with the graphics mode, with the help of basic algorithms and methodologies.
- The objective of the course is to equip students with fundamental knowledge and basic technical competence in the field of computer graphics.
- Provide an understanding of how a computer draws the fundamental graphics primitives.
- To learn Computer Graphics methodologies/Algorithms and techniques and their implementations.

1. **Introduction to Computer Graphics and graphics primitives**: Overview of interactive graphics model, applications of computer graphics, graphics devices, random and raster scan systems, color models: RGB, YIQ, scan conversion: point, line, circle and ellipse. [7]
2. **2D Transformation and Viewing**: Basic transformations (translation, rotation, scaling), homogeneous coordinates, composite transformations, reflection and shearing, filling: scan line filling, flood filling, boundary filling, clipping: point clipping, line clipping, polygon clipping, and character generation. [7]
3. **Curves and Surfaces**: Introduction to curves, conic curves, polygon surfaces, tables, quadric surfaces, spline representation, cubic spline interpolation methods, Bezier curves and surfaces, B-spline curves and surfaces, fractals and its applications. [7]
4. **3D Transformation and Viewing**: 3D transformation, composite transformation, viewing pipeline, parallel and perspective projection, visible surface detection: classification of visible surface detection algorithms, back face detection, depth buffer method, A-buffer method, scan-line method, depth sorting method. [7]
5. **Illumination Model and Surface Rendering Techniques**: Basic illumination models, Halftone patterns and dithering techniques, polygon rendering methods, ray tracing methods. [6]
6. **Introduction to Animation and Multimedia:** Introduction to animation, key-frame animation, construction of an animation sequence, animation techniques, multimedia: introduction, features of multimedia system, components of multimedia systems and application of multimedia systems. [6]

Outcome(s): On successful completion of this course, students will be able to

- Understand basic concepts of computer graphics.
- Acquire knowledge about drawing basic shapes such as lines, circle ellipse, polygon.
- Perform processing of basic shapes by various processing algorithms /techniques.
- Implement two and three dimensional transformations.
- Apply various algorithms of clipping.
- Acquire knowledge about illumination models, color models and surface rendering.

Text Books:

1. Donald D. Hearn & M. Pauline Baker, Computer Graphics-C Version, Pearson Education, 2nd edition, 2002.
2. James D. Foley, Andries van Dam, Steven K Feiner, John F. Hughes, Computer Graphics Principles and Practice, 2nd Edition in C, Addison Wesley, 1995.

Reference Books:

1. Donald Hearn and M Pauline Baker, Computer Graphics with OpenGL, Pearson Education, 4th edition, 2010.
2. David F. Rogers, Procedural Elements for Computer Graphics, Tata McGraw Hill Publications, 2nd edition, 2001.

CS-14.318 **Artificial Intelligence** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS-14.101 (Programming Language), CS-14.207(Computer Information Systems)

Objective(s):

- To understand the basic problem solving in Artificial Intelligence.
- To learn different blind as well as heuristic search strategies.
- To understand the various ways of knowledge representation in Artificial Intelligence.
- To know the concepts of game theory and natural language processing.

1. **Overview of Artificial Intelligence:** Introduction to artificial intelligence and intelligent agents, brief history of artificial intelligence, related research fields, AI techniques, AI problems, applications of AI, future of AI, basic concepts of LISP and PROLOG. [6]
2. **Problem Solving and Search Techniques:** Basics of problem solving, Problem representation paradigms, defining problem as a state space representation, uninformed search, depth first search, breadth first search, heuristic search, heuristic functions, generate and test, hill climbing, best first search, A* algorithm, problem reduction, AND/OR graph, AO* algorithm. [10]
3. **Knowledge Representation and Logic:** Representation and mappings, procedural versus declarative knowledge, approaches and issues in knowledge representation, introduction to logic-based problem solving, Boolean logic, first order logic, higher order logic, unification and resolution for performing logical inference, fuzzy logic, probabilistic logic. [8]
4. **Game Theory:** Minimax search, alpha-beta cutoffs, iterative deepening, references on specific games. [5]
5. **Natural Language Processing:** Introduction to NLP, syntactic processing, semantic analysis, discourse and pragmatic processing. [5]
6. **Learning:** Learning from observation, rote learning, inductive learning, explanation basedlearning, statistical learning methods, supervised and unsupervised learning, basics of neural network, reinforcement learning discovery, analogy. [6]

Outcome(s): On successful completion of this course, students will be able to

- Solve the basic problems and apply searching techniques used in Artificial Intelligence.
- To select knowledge representations to solve AI problems.
- Apply various game playing algorithms.
- Work with natural language processing and apply learning techniques.

Text Books:

1. Rich E., and Knight K., Artificial Intelligence, Tata McGraw-Hill, 3rd edition, 2009.
2. Russell S., and Norvig P., Artificial Intelligence – A Modern Approach, Prentice-Hall of India, 3rd edition, 2014.

Reference Books:

1. Patterson D. W., Introduction to Artificial Intelligence and Expert Systems, Prentice-Hall of India, 1st edition, 2015.
2. George F. Luger, Artificial Intelligence: Structures and Strategies for Complex Problem Solving, Pearson Education, 5th edition, 2009.

CS-14.320 **Cryptography** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS-14.201 (Discrete Structures), CS-14.207 (Computer Information Systems)

Objective(s):

- To understand the classical encryption and decryption algorithms, their techniques as well cryptanalysis.
- To acquire basic knowledge of finite fields and number theory.
- To understand the various block ciphers, stream cipher models, principles of public key cryptosystems, hash functions and digital signatures.
- To understand the different authentication techniques.

1. **General Overview and Classical Cryptography:** General overview of threats, risks and consequences, sources of threats, attacks, classification and preventive measures, introduction to some simple ciphers such as shift cipher, substitution cipher, affine cipher, Vigener cipher, hill cipher, permutation cipher and stream ciphers, rigorous cryptanalysis of all the above ciphers. [8]
2. **Symmetric/Secret Key Cryptography:** Block ciphers and their principles- boxes, P-boxes, DES, 3 DES, AES. [6]
3. **Elementary Number Theory:** Euclid's algorithm, extended Euclid's algorithm, groups, solving modular linear equations, Chinese remainder theorem, modular exponentiation, discrete logarithm problem, prime numbers and primality testing, factorization problem, Fermat's and Euler's theorem, computation of generators of primes. [8]
4. **Key Exchange/Distribution Schemes:** Diffie - Hellman key exchange, man- in- the-middle attack,Fiat-Naor key distribution, Needham – Schroeder scheme and attack possible on it, Kerberos. [6]
5. **Asymmetric Key/Public Key Cryptosystems:** RSA description, different attacks on RSA and remedies, other public keycryptosystems such as ElGamal and Rabin cryptosystems and possible attacks on them. [6]
6. **Digital Signature Schemes:**Security requirements for digital signatures, ElGamal digital signature scheme and its security analysis, the digital signature algorithm (DSA), Schnorr digital signature scheme, provably secure signature schemes and undeniable signatures. [6]

Outcome(s): On successful completion of this course, students will be able to :

- Analyze the security threats.
- Design robust cryptographic algorithms.

Text Books:

1. Douglas R. Stinson, Cryptography: Theory and Practice, (Discrete Mathematics and Its Applications) Chapman and Hall/CRC, 3rd edition, 2005.

Reference Books:

1. Jonathan Katz , Yehuda Lindell, Introduction to Modern Cryptography, (Cryptography and Network Security Series), Chapman and Hall/CRC; 2nd edition, 2014.
2. William Stallings, Cryptography and Network Security: Principles and Practice, Pearson Education, 6th edition 2013.
3. Wenbo Mao, Modern Cryptography Theory & Practice, 1st edition, 2004.

CS-14.322 **Data Mining** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS-14.204 (Database Management System), CS-14.301(Design and Analysis of Algorithms), MA-14.202 (Statistics and Probability Theory).

Objective(s):

- Understand the functionality of the various data mining and data warehousing components.
- Appreciate the strengths and limitations of various data mining and data warehousing models.
- Compare the various approaches to data warehousing and data mining implementations
- Describe and utilize a range of techniques for designing data warehousing and data mining systems for real-world applications.

1. **Overview:**Evolution of the database system technology, concept of data mining and warehousing, data warehouse roles and structures, cost of warehousing data, approaches to data exploration and data mining, foundations of data mining, web warehousing, introduction to knowledge management and knowledge bases. [5]
2. **Data Warehouse:**Overview of data warehousing, data marts, data warehouse architecture, multidimensional data model, online analytical processing (OLAP), OLAP operations, data about data - metadata. [4]
3. **Data Mining and Data Visualization:** Data mining general approach, classification and clustering, introduction to DM tool (Weka,Rapidminer), techniques used to mine the data, current limitations and challenges to DM, data visualization, visualization tools. [6]
4. **Data Preprocessing:** Overview, data cleaning, data integration, data reduction strategies, principal component analysis, sampling, histograms, clustering, data cube aggregation, data transformation and discretization. [6]
5. **Machine Learning:**Supervised and unsupervised machine learning, market basket analysis (Apriori algorithm), fuzzy logic and linguistic ambiguity, artificial neural networks, genetic algorithms,genetically evolved networks, applications for machine learning. [7]
6. **Text Mining:**Information retrieval and search, text classification, text clustering, unsupervised learning, mining frequent patterns and correlations, classification concepts, backpropagation, decision tree induction, rule based classification, clustering basic concepts and methods, K-means centroid based technique. [6]
7. **Web Based Statistical Analysis:** Delivering information over the web, query and reporting tools and business value, business value from analytical tools, statistical analysis applications, data discovery tools overview, data discovery applications, search engines and the web, search engine architecture, future of data mining. [6]

Outcome(s): On successful completion of this course, students will be able to

- Identify, formulate, and solve data science related problems by applying principles of the course.
- Understand both analysis and synthesis in the design process with the help of data mining and data warehousing tools.
- Develop and conduct appropriate experiments, analyze and interpret data, and use data visualization to draw conclusions.
- Function effectively on teams that establish goals, plan tasks,meet deadlines, and analyze risk and uncertainty.

Text Books:

1. George M Marakas, Modern Data Warehousing, Mining and Visualization, Pearson Education, 1st edition, 2002.
2. **Ian H. Witten and Eibe Frank, Data Mining: Practical Machine Learning Tools and Techniques, Morgan Kaufmann, 3rd edition, 2011.**
3. Mattison R., Web Warehousing and Knowledge Management, Tata McGraw-Hill, 1st edition, 1999.

Reference Books:

1. W.H. Inmon, BuildingtheData Warehouse, Wiley Publishing Inc., 3rdedition, 2005.
2. Anahory and Murray, Data Warehousing in the Real World, Pearson Education/Addison

Wesley, 1st edition, 1997.

3. Prabhu C.S.R., Data Warehousing, Prentice-Hall of India, 2nd edition, 2002.

CS-14.324 **Data Compression** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): MA-14.202 (Statistics and Probability Theory)

Objective(s):

- To develop theoretical foundations of data compression.
- To know the concepts and algorithms for lossy and lossless data compression.
- To understand signal modeling and its extension to compression with applications to speech, image and video processing.

1. **Introduction:** Compression techniques, measures of performance, modeling and coding, information theory, Shannon coding theory, physical models, probability models, Markov models, composite source model, fixed and variable length codes, uniquely decodable codes, prefix codes, Kraft's theorem. [10]

2. **Lossless Compression:** The Huffman coding algorithm: minimum variance Huffman codes, adaptive Huffman coding, Golomb codes, rice codes, Tunstall codes, coding a sequence, generating a binary code, comparison of binary and Huffman coding, diagram coding, dictionary based compression techniques, adaptive dictionary, LZ77, LZ78 and LZW approach, predictive coding, prediction with partial match, the Burrows-Wheeler transform, facsimile encoding, dynamic Markov compression. [10]

3. **Lossy Compression:** Distortion criteria, distortion measurement models, scalar quantization, uniform quantizer, adaptive quantization, non-uniform quantization, advantages of vector quantization over scalar quantization, the Linde-Buzo-Gray algorithm, tree structured vector quantizers, structured vector quantizers. [10]

4. **Multimedia Compression:** M-law and A-law commanding, DPCM and ADPCM audio compression, MPEG audio standard, frequency domain coding, lossless techniques of image compression, gray codes, transform coding, GIF**,** JPEG, predictive techniques, PCM and DPCM, video compression and MPEG industry standard, wavelet based compression. [10]

Outcome(s): On successful completion of this course, students will be able to

- Understand the concepts, applications and models of data compression.
- Apply the methods of lossy and lossless data compression.
- Apply the methods and standards of image, audio and video data compression.

Text Books:

1. **Khalid Sayood, Introduction to data compression, Morgan Kaufmann Publishers, 4th edition, 2012.**

Reference Books:

1. Mark Nelson and Jean-Loup Gailly: The Data Compression Book, M&T Books, 2nd edition, 1996.
2. David Salomon, Data Compression: The Complete Reference, Springer, 4th edition, 2006.

ET 471 **Cloud Computing (Infosys)** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s):
Objective(s):

1. **Overview of Cloud Computing:** Brief history and evolution - History of Cloud Computing, Evolution of Cloud Computing, Traditional vs. Cloud Computing. Why Cloud Computing, Cloud service models (IaaS, PaaS & SaaS). Cloud deployment models (Public, Private, Hybrid and Community Cloud), Benefits and Challenges of Cloud Computing. Introduction to AWS Public Cloud Vendor. Cost optimization in AWS. [10]

2. **Virtualization**: Basics of virtualization, Virtualization technologies, Server virtualization, VM migration techniques, Role of virtualization in Cloud Computing. Introduction to EC2 service of AWS. [8]

3. **Working with Private Cloud:** Private Cloud Definition, Characteristics of Private Cloud, Private Cloud deployment models, Private Cloud Vendors - CloudStack, OpenStack, Eucalyptus Microsoft, Private Cloud – Benefits and Challenges. Private Cloud implementation in Amazon EC2 service. [8]

4. **Working with Public Clouds:** What is Public Cloud, Why Public Cloud, When to opt for Public Cloud, Public Cloud Service Models, and Public Cloud Players. Infrastructure as a Service Offerings, IaaS Vendors, PaaS offerings, PaaS vendors, Software as a Service. Demonstrating public cloud with AWS – Storage and Database services. Private vs. Public Cloud – When to choose. [12]

5. **Overview of Cloud Security:** Explain the security concerns in Traditional IT, Introduce challenges in Cloud Computing in terms of Application Security, Server Security, and Network Security. Security reference model, Abuse and Nefarious Use of Cloud Computing, Insecure Interfaces and APIs, Malicious Insiders, Shared Technology Issues, Data Loss or Leakage, Account or Service Hijacking, Unknown Risk Profile, Shared security model between vendor and customer in IAAS/PAAS/SAAS, Implementingsecurity in AWS. [8]

6. **Future directions in Cloud Computing:** When and not to migrate to Cloud, Migration paths for cloud, Selection criteria for cloud deployment, Issues/risks in cloud computing, Future technology trends in Cloud Computing. [4]

Text Books:

2. Cloud Computing, By Michael Miller, 2008.
3. Cloud Computing for dummies, By Judith Hurwitz, Robin Bllor, Marcia Kaufman, Fern Halper, 2009.
4. Cloud Computing: A Practical Approach, By Anthony T. Velte, Toby J. Velte, and Robert Elsenpeter, McGraw Hill, 2010.
5. Handbook of Cloud Computing, By BorkoFurht, Armando Escalante (Editors), Springer, 2010.

Reference Books:

1. Cloud computing: Implementation, management and security By Rittinghouse, John, W.
2. Cloud Computing Bible, By Barrie Sosinsky, Wiley, 2011.
3. Cloud Computing Architected: Solution Design Handbook by Rhoton, John.
4. Cloud Security, A comprehensive Guide to Secure Cloud Computing by Krutz, Ronald L.; Vines, Russell Dean

CS-14.352 **Software Engineering Laboratory** **Credit:0-0-2-1**

Prerequisite(s): CS-14.111 (Programming Language Lab),CS-14.223 (Data Structures Lab.) CS-14.351(DAA Lab), CS-14.224(Database Management Systems Lab.)

Objective(s):

- studying various phases of software development life cycle.
- Problem definition of any system (e.g. ATM system,health care, airlines, banking, insurance, retail, education or latest systems).
- Feasibility study of the system.
- Identifying the requirements from problem statements(IEEE Std:830-1993)
- Requirements, categorization of requirements, functional requirements, identifying functional requirements, non functional requirements.
- data flow diagram, graphical notations for data flow diagram, explanation of symbols used in DFD,context diagram and leveling DFD.
- Entity Relationship Model,entity set and relationship set , attributes of entity ,keys ,ER diagram ,graphical notations for ER ,estimation of projects, project metrics.
- Project estimation techniques ,COCOMO , Calculate effort using FP oriented estimation model , LOC based estimation for size oriented metrics
- Designing test suites, unit testing, integration testing, system testing, black box testing, and white box testing.
- Use some of the tools that are used in the different software development stages.

Contents:

Lab manual based upon the theory course CS 14.302 and to achieve the listed course objectives and outcomes.

Outcome(s): **On successful completion of this lab, students will be able to**

- Plan a software engineering process life cycle (SDLC Models) , including the specification, design, implementation, and testing of software systems that meet specification, performance,

maintenance and quality requirements

- Elicit, analyze and specify software requirements through a productive working relationship with various stakeholders of the project.
- Analyze and translate a specification into a design, and then realize that design practically, using an appropriate software engineering methodology and students are also able to calculate the approximate cost, time estimation of the project or system.
- Develop the code from the design and effectively apply relevant standards and perform testing, and quality management and practice, and students are also able to remove some errors, bugs, of the project or system.
- Use modern engineering tools necessary for software project management, time management.
- Apply software engineering principle for developing real life web and mobile applications.

CS-14.354 **Compiler Design Laboratory** **Credit: 0-0-2-1**

Prerequisite(s): CS 14.111(Programming Language Lab.) CS 14.223(Data Structures Lab.)

Objective(s):

- To design and implement a lexical analyzer
- To design and implement a parser
- To design and implement symbol tables
- To understand and design code generation schemes
- To learn the working of some compiler writing tools

Contents:

Lab manual based upon the theory course CS 14.304 and to achieve the listed course objectives and outcomes.

Outcome(s): On successful completion of this course, the students will be able to

- understand the peculiarities of a language translator
- get the practical approach of how a compiler works
- work in the development phase of new computer languages in industry
- understand the working of compiler construction tools
- visualize and design a new compiler of her own language

CS-14.356 **Computer Network Laboratory** **Credit: 0-0-2-1**

Prerequisite(s): CS14.111 (Programming Language Lab.), CS 14.223(Data Structures Lab.)

Objective(s):

- To implementing the client/server model with its application aspects.
- Sniffing packets in network as a network analyzer
- To implement protocols at various types communicating protocols
- To implement socket programming application with inbuilt API
- To code error correction and detection technique like CRC, checksum and parity

Contents: Lab manual based upon the theory course CS 14.306 and to achieve the listed course objectives and outcomes

Outcome(s): On successful completion of this course, students will be able

- To know how communication works at different layers of TCP/IP model
- To understand practically the purpose of various key protocol.
- To learn how a network can be efficiently deployed.
- To identify and analyze the latest technology with existing one.
- To configure network with client/server programming
- To understand computer network component and devices.

CS-14.374 **Comprehensive-II** **Credit: 0-0-0-4**

Prerequisite(s): CS-14.220 (Comprehensive-I), CS-14.301 (Design and Analysis of Algorithms), CS-14.303 (Operating System), CS-14.305 (Logic in Computer Science), CS-14.309 (Microprocessor and Assembly Language Programming), CS-14.332 (Software Engineering), CS-14.334 (Compiler Design), CS-14.336 (Computer Networks)

Objective(s):

- To examine the understanding of the student in different fields of computer science in concise manner.

1. **Design and Analysis of Algorithms:** Sorting, divide and conquer, graph theory, greedy algorithms, dynamic programming, backtracking, NP complete.
2. **Operating System:** Batch processing, multiprogramming, multiprocessing, and multitasking, process management, CPU scheduling, I/O scheduling, resource scheduling, deadlock and scheduling algorithms. Banker's algorithm for deadlock handling, memory management: virtual memory, paging, segmentation, concurrent processing: mutual exclusion, critical regions lock and unlock, scheduling.
3. **Logic in Computer Science:** Propositional (Boolean) logic, predicate logic, well–formed–formulae (WFF), satisfiability and tautology.
4. **Microprocessor:** Introduction to microprocessor, microprocessor instruction set, architecture of microprocessor, register set, mapping of memory and I/O devices, addressing modes, counters and time delays.
5. **Software Engineering**: Information gathering, requirement and feasibility analysis, data flow diagrams, process specifications, input/output design, process life cycle, planning and managing the project, design, coding, testing, implementation, maintenance.
6. **Compiler Design:** Context free languages and push-down automata, recursively enumerable sets and Turing machines, undecidability, lexical analysis, syntax and semantic analysis, intermediate code generation, code generation and optimization.
7. **Computer Networks:**ISO/OSI stack, LAN technologies (Ethernet, token ring), flow and error control techniques, routing algorithms, congestion control, TCP/UDP and sockets, IPv4, application layer protocols (ICMP, DNS, SMTP, POP, FTP, HTTP), basic concepts of hubs, switches, gateways, and routers, network security, basic concepts of public key and private key cryptography, digital signature, firewalls.

Outcome(s):

- At the end of this course students will be able to comprehend her knowledge gained in the entire year.

RM 17.101 **ResearchMethodology** **2-0-0-2**

1. **Introduction:** Meaning of research, Objectives, Motivation for Research, Types of Research, Research Approaches,ResearchProcess,ValidityandReliabilityin Research. [2]

2.**ProblemFormulation:**Identification,Selection andFormulation ofa ResearchProblem, Criteria ofagoodResearchProblem,Reviewof Literature, Research Gaps. [4]

3.**Research Design:**ResearchFramework, Meaning &SignificanceofResearchDesigns,Featuresofa goodResearch Design, Types of Research Design. [4]

4.**Dataforresearch:**TypesofData,Sources of Data, Methods of CollectingData,DataPresentation Techniques.Methodsof DataAnalysis.[4]

5. **Data Analysis and Simulation Tool:**Introduction to SPSS, MATLAB, Network Simulators, ETAP, Solid Works, MultiSim. [8]

6. **ReportWriting:**Types of Reports,Contents, Style Manuals, Results & Findings, Contributions, Implications, Scope for future work and conclusion, Referencing Styles, Anti Plagiarism Policy. [4]

CS 14.401 **Soft Computing** **Total Lectures: 40**
Credit: 3-0-0-3

Prerequisite(s): CS 14.305(Logic in Computer Science)

Objective(s):
- To familiarize with soft computing concepts
- To introduce the idea of neural networks, fuzzy logic and use of heuristics based on human experience
- To introduce the concept of genetic algorithm and its applications to soft computing using some applications

7. **Introduction**: Introduction of soft computing, types of soft computing, applications of soft computing, introduction of artificial intelligence, production system, various search techniques, hill climbing, best first search, knowledge representation, monotonic and non-monotonic reasoning. [8]
8. **Neural Networks:**Structure and function of a single neuron, definition of ANN, characteristics of ANN, applications of ANN, single layer networks, perceptron training algorithm, linear separability, various learning rules, delta rule, ADALINE, MEDALINE, multi-layer networks, activation functions, error back propagation algorithms, characteristics of EBPA. [8]
9. **Neral Network Architectures**: Counter propagation networks, architecture, functioning, characteristics, Hopfield network, configuration, associative memory, limitations and applications, Hopfield vs Boltzman machine, adaptive resonance theory, architecture, classification, implementation and training [8]
10. **Fuzzy Logic :**Fuzzy logic, fuzzy set theory, fuzzy set vs crisp set, crisp relation and fuzzy relation, introduction and features of membership functions, fuzzy rule based system, fuzzy propositions, formation, decomposition and aggregation of fuzzy rules, fuzzy reasoning, fuzzy interference system, fuzzy decision making, applications of fuzzy logic. [8]
11. **Genetic Algorithms :**Genetic algorithm, fundamentals, basic concepts, working principle, encoding, fitness function, reproduction, genetic modelling, inheritance operator, cross over, inversion and deletion, mutation operator, bitwise operator, generational cycle, convergence of GA, applications and advances in GA, difference and similarities between GA and other traditional methods. [8]

Outcome(s): On successful completion the students will be able to:
- Identify and describe soft computing techniques and their roles in building intelligent machines
- Apply fuzzy logic and reasoning to handle uncertainty and solve engineering problems
- Apply genetic algorithms to combinatorial optimization problems
- Apply neural networks to pattern classification and regression problems
- Evaluate and compare solutions by various soft computing approaches for a given problem

Text Books:

2. Timothy J.Ross, "Fuzzy Logic with Engineering Applications", McGraw-Hill, 3rdEdition, 2009.
3. Davis E. Goldberg, "Genetic Algorithms: Search, Optimization and Machine Learning", Pearson Education , 2006

CS 14.403 **Parallel Computing** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 14.208 (Computer Organization and Architecture)

Objective(s):

- To provide students with contemporary knowledge in parallel computing.
- To equip students with skills to design and analyze parallel applications.
- Describe the various design issues in a parallel computing System e.g. system performance and reliability, distributed file system etc.
- Describe and program the communication among processes at different hosts to facilitate parallel computing.

1. **Introduction**: scope and issues of parallel and distributed computing, taxonomy of parallel structures, control mechanism, address-space organization, interconnection connection networks: static and dynamic interconnection networks, evaluating static interconnection networks, embedding other networks (linear array, mesh, binary tree) into a hypercube, routing mechanisms for static interconnection networks: store and forward (SF) routing, cut - theory (CT) routing, cost-performance trade-off, architectural models for parallel algorithm design. [8]
2. **Basic Communication Operation**: Simple message transfer between two processors, one-to-all broadcast, all-to-all broadcast, reduction and prefix sums, one-to-all personalized communication, all-to-all personalized communication, circular shift. [7]
3. **Performance and Scalability of Parallel Systems**: Performance matrices for parallel systems: run time, speed up, efficiency and cost, the effect of granularity and data mapping on performance, scalability of parallel systems, ISO-efficiency metric of scalability. [7]
4. **Models of Distributed Computing**: Mini computer model, workstation pool model, client-server model, pool of processors model, hybrid model. [6]
5. **Inter Process Communication and Remote Procedure Calling**: Building blocks, client-server communication,group communication, case study: inter processor communication in Unix, design issues in remote procedure calling, implementation. [6]
6. **Parallel Computing Algorithms**: Various sorting and searching algorithms, performance metrics for parallel algorithm implementations. [6]

Outcome(s): At the end of this course, student will be able to accomplish following.

- Define terminology commonly used in parallel computing, such as efficiency and speedup.
- Describe different parallel architectures, inter-connect networks, programming models, and algorithms for common operations such as matrix-vector multiplication.
- Given a problem, develop an efficient parallel algorithm to solve it.
- Given a parallel algorithm, analyze its time complexity as a function of the problem size and number of processors.
- Given a parallel algorithm, an input to it, and the number of processors, show the steps performed by that algorithm on that input.

Text Books:

2. George Coulouris, Jean Dollimore and Tim Kindberg," Distributed Systems Concepts and Design", 4th Ed., Pearson Education, 2009.

Reference Books:

1. S G Akl, "The Decision and Analysis of Parallel Algorithms", Prentice Hall, 1989.
2. Hwang, Kai, "Advanced Computer Architecture: Parallelism, Scalability, Programmability", 2nd Ed., McGraw Hill, 2011.
3. J Jaja, "An Introduction to Parallel Algorithms", Addison Wesley, 1992.
4. T G Lewis and H El Rewini, "Introduction to Parallel Computing", Prentice-Hall 1992.

CS-14.405 **Digital Image Processing** **Total Lectures: 40**
Credit: 3-0-0-3

Prerequisite(s): CS-14.101 (Programming Language), MA-14.201(Applied Mathematics)

Objective(s):

- To study the image fundamentals and mathematical transforms necessary for image processing.
- To study the image enhancement techniques
- To study image restoration procedures.
- To study the image compression procedures.
- To study the image segmentation and representation techniques
- To study the image representation in form of features and descriptors

1. **Digital Image Fundamentals:** Elements of digital image processing systems, elements of visual perception, brightness, contrast, hue, saturation, mach band effect, color image fundamentals - RGB, HSI models, image sampling, quantization, dither, two-dimensional mathematical preliminaries, 2D transforms - DFT, DCT, KLT, SVD. [7]
2. **Image Enhancement and Restoration:** Histogram equalization and specification techniques, noise distributions, spatial averaging, directional smoothing, median, geometric mean, harmonic mean, contra harmonic mean filters, image restoration - degradation model, unconstrained restoration, inverse filtering, removal of blur caused by uniform linear motion. [7]
3. **Morphological Image Processing:** Basics, structuring element, erosion, dilation, opening, closing, hit-or-miss transform, boundary detection, hole filling, connected components, convex hull, thinning, thickening, skeletons, pruning, and reconstruction by dilation and erosion. [7]
4. **Image Segmentation:** Edge detection, edge linking via Hough transform, thresholding, region based segmentation, region growing, region splitting and merging, and segmentation by morphological watersheds, basic concepts, dam construction, and watershed segmentation algorithm. [7]
5. **Image Representation:** Boundary representation, chain code, polygonal approximation, signature, boundary segments, boundary description, shape number, Fourier descriptor, regional descriptors, and topological features. [6]
6. **Image Compression:**Need for data compression, Huffman, run length encoding, shift codes, arithmetic coding, vector quantization, transform coding, JPEG standard, MPEG. [6]

Outcome(s): On successful completion of this course, students will be able to

- Discuss digital image fundamentals.
- Apply image enhancement and restoration techniques.
- Use image compression and segmentation Techniques.
- Represent features of images.

Text Books:

3. Rafael C. Gonzales, Richard E. Woods, “Digital Image Processing”, Third Edition, Pearson Education, 2010.
4. Anil Jain K. “Fundamentals of Digital Image Processing”, PHI Learning Pvt. Ltd., 2011.
5. Bernd Jähne, Digital Image Processing, Springer Science & Business Media, 29-Jun-2013.

Reference Books:

6. Rafael C. Gonzalez, Richard E. Woods, Steven L. Eddins, “Digital Image Processing Using MATLAB”, Third Edition Tata Mc Graw Hill Pvt. Ltd., 2011.
7. William K Pratt, “Introduction to Digital Image Processing”, CRC Press, 13-Sep-2013.

CS 14.411 **Advanced Computer Architecture** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 14.101 (Programming languages), CS 14.208 (Computer Organization and Architecture)

Objective(s):

- To discuss the organization of computer-based systems and how a range of choices are influenced by application.
- To understand the organization and operation of current generation computer systems including multiprocessor and multicore systems.
- To understand the principles of I/O in computer systems including viable mechanism for I/O and secondary storage organization.

1. **Introduction**: Overview of parallel processing and pipelining, study and comparison of uni-processors and parallel processors, architectural classification, applications of parallel processors, instruction level parallelism, performance matrices and measures, speedup. [6]
2. **Pipelining:**Principles and implementation of pipelining, classification of pipelining processors, pipeline architecture, general pipelining reservation table, design aspect of arithmetic and instructional pipeline, pipelining hazards and resolving techniques, advanced pipelining techniques, software pipelining, implementation issues. [8]
3. **Vector and Array Processors** : Vector and array processors, basic vector architecture, issues in vector processing, SIMD computer architecture, masking and data network mechanism, interconnection networks of SIMD, static vs dynamic networks, parallel algorithm for array processors, matrix multiplication, sorting, implementation issues. [10]
4. **Multiprocessor Architecture** : Multiprocessor architecture, loosely and tightly coupled multiprocessors, characteristics of multiprocessor, inter-processor communication network, memory contention and arbitration techniques, cache coherence, bus snooping, massively parallel processors, inter process communication and synchronization. [10]
5. **Parallel Algorithms:**Multithreading, synchronous and asynchronous message passing, shared memory, study of parallel programming concepts, parallel algorithm for multiprocessors, operating system for multiprocessors, message passing interfaces, parallel programming languages, Fortran 90, Occam, C-Linda, CCC. [6]

Outcome(s): On successful completion of this course, students will be able to

- Describe the operation of performance enhancements such as pipelines, dynamic scheduling, branch prediction, cache, and vector processors.
- Describe modern architectures such as RISC, super scalar, multiprocessor and multicore systems.
- Develop applications for high performance computing systems.

Text Books:

1. Kai Hwang, Naresh Jotwani, “Advanced Computer Architecture”, McGraw-Hill Education, 2011.
2. John L Hennessey, David A Patterson, “Computer Architecture – A Quantitative Approach”, Morgan Kaufmann, Elsevier Publishers, 5thedition, 2012.

Reference Books:

1. Kai Hwang, Zhi Wei Xu, “Scalable Parallel Computing”, McGraw Hill,1998.
2. Kai Hwang, Faye A Briggs, “Computer Architecture and Parallel Processing”, McGraw Hill, 1984.

CS 14.413 **Foundations and Applications of IoT** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 14.101 (Programming Language), CS 14.303 (Operating System), CS 14.306 (Computer Networks)

Objective(s):
- To introduce the vision and impact of IoT.
- To understand IoT Market perspective.
- To understand the challenges that must be overcome by IoT technology.

1. **M2M to IoT:** The vision-introduction, from M2M to IoT, M2M towards IoT-the global context, a use case example, differing characteristics. [5]

2. **M2M to IoT – A Market Perspective:** Introduction, some definitions, M2M value chains, IoT value chains, an emerging industrial structure for IoT, the international driven global value chain and global information monopolies, M2M toIoT-an architectural overview, building an architecture, main design principles and needed capabilities, an IoT architecture outline, standards considerations. [9]

3. **M2M and IoT Technology Fundamentals:** Devices and gateways, local and wide area networking, data management, business processes in IoT, everything as a service (XaaS), M2M and IoT analytics, knowledge management. [7]

4. **IoT Architecture- Introduction, State of the art:** Architecture reference model-introduction, reference model and architecture, IoT reference model. [6]

5. **IoT Reference Architecture:**IoT reference architecture- introduction, functional view, information view, deployment and operational view, other relevant architectural views, real-world design constraints- introduction, technical design constraints-hardware is popular again, data representation and visualization, interaction and remote control. [8]

6. **Implementation Examples:** Industrial automation, the smart grid, smart cities. [5]

Outcome(s): On successful completion of this course, students will be able to
- Understand the vision of IoT from a global context.
- Determine the Market perspective of IoT.
- Understand the use of Devices, Gateways and Data Management in IoT.
- Build architecture in IoT
- Analyze, design and develop parts of IoT solution

Text Books:

1. Jan Holler, VlasiosTsiatsis, Catherine Mulligan, Stefan Avesand, Stamatis Karnouskos, David Boyle, “From Machine-to-Machine to the Internet of Things: Introduction to a New Age of Intelligence”, 1st Edition, Academic Press, 2014.
2. Malcolm Frank, Paul Roehrig, Ben Pring,"What To Do When Machines Do Everything" ,John Wiley & Sons, 13-Feb-2017

2. Peter Waher, "Learning Internet of Things", Packt Publishing Ltd, 27-Jan-2015.
3. Francis daCosta, “Rethinking the Internet of Things: A Scalable Approach to Connecting Everything”, 1st Edition, Apress Publications, 2013

CS 14.415 **Data Science and Big Data Analytics** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 14.204 (Database Management System)

Objective(s): To understand the fundamental concept of Data Science and Big Data Analytics and its application in various fields.

1. **Data and its Classifications**: Data, information, knowledge and wisdom, digital and analog data, unstructured data,semi-structured data ,structured data, sources of data, dealing with unstructured data, data science and responsibilities of data scientist, database, data warehouse, data mining and big data. [10]
2. **Introduction to Big Data**: Big data, characteristics of big data-volume, velocity, variety,challenges with big data, applications of big data in healthcare, agriculture, education, scientific experiments, advertising, stock market etc., integrity and privacy of big data, big data and cloud computing, big data and IoT. [10]
3. **Classification of Analytics:** Descriptive, diagnostic, discovery, prescriptive and predictive analytics, big data analytics, semantic analytics, in-memory analytics, analytics and decision making, shared nothing architecture, CAP theorem, parallel and distributed system, massively parallel processing. [10]
4. **Hadoop and its Architecture**: RDBMS and Hadoop, master slave architecture, HDFS, name node, secondary name node, data node, HDFS client, replica placement strategy, MapReduce, job tracker, task tracker, map phase, reduce phase, shuffle phase, Hadoop 1.0 and Hadoop 2.0, YARN, Installation of Hadoop in pseudo distributed mode and full distributed mode. [10]

Outcome(s): On successful completion of this course, students will be able to

- Apply learning and knowledge ofData Science and Big Data Analytics to solve real life problems in various areas of social importance.

Text Books:

ET 463 **Enterprise Computing – I** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS14.101 (Programming Language), CS 14.204 (Database Management System)

Objective(s):

- To define enterprise computing
- To provide an in-depth and comprehensive knowledge of the hardware and software architecture of enterprise system
- To introduce about the enterprise standards

1. **Characteristics of Enterprise Computing:** Reliability, availability, scalability, capacity, access to large amount of data, integrity and security, system management, autonomic capabilities. [5]
2. **Introduction to TSO & ISPF:** Logging in a mainframe, understanding ISPF menus, understanding datasets & record length, sequential, partitioned VSAM, creation of a PDS for programs, JCL etc. vs Loadlib, creation of a sequential DS for application data, understanding catalog, using ISPF editor. [10]
3. **JCL & SDSF Basics:** Basic JCL programming, modifying an existing compile, link and execute JCL for specific use, JOBCARD, DD statements, understanding JOB-STEP, understanding JOBLIB and STEPLIB, understanding PARM to move data from JCL to program, understanding SDSF outputs. [10]
4. **Basic Application Programming:** Understanding logical file name (used in program) and physical file name (used in JCL) and how they are mapped, writing a simple COBOL program with data stored in a VSAM file or a flat file (intent is not to teach COBOL language, the student should be able to apply the language in the environment, student will be provided with sample JCLs & VSAM file that will be used in program). [10]
5. **Introduction to SPUFI:** Understanding how to use SPUFI environment to write and execute SQL statements. [5]

Outcome(s): On successful completion of this course, students will be able to

- Describe the hardware and software architecture of an actual enterprise platform and explain the main functionality of the physical and virtual components.
- Perform basic administrative tasks in an enterprise computer system such as: the creation of new users, job monitoring and management, and back-ups and re- store operations.
- Possess basic practical knowledge regarding the process of installing, configuring and operating applications in an enterprise computer system as well as applying updates to the operating system

Text Book:

1. Alex Leon , IBM Mainframe Handbook, 1/e PB 1st Edition.
2. Alan Simon, “Network Re-engineering: Foundations of Enterprise Computing”, Academic Press, 2012.
3. Mike Ebbers, John Kettner, Wayne O'Brien, Bill Ogden, IBM Redbooks, “Introduction to the New Mainframe: z/OS Basics”, IBM Redbooks, 2012.

ET-362 **Mobile Apps Development** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): CS 14.202(Java Programming)

Objective(s):

- To learn how mobile apps are different from others traditional apps by learning those aspects of mobile programming that make it unique from other platforms
- Program mobile applications for the Android operating system that use basic and advanced phone features
- Deploy applications to the Android marketplace for distribution.

1. **Getting started with Mobility:** Mobility landscape, mobile platform, mobile apps development, overview of android platform, setting up the mobile app development environment along with an emulator, a case study on mobile app development. [8]
2. **Building blocks of mobile apps: Apps user:** Interface designing-mobile UI resources (Layout,UI elements, Draw-able,Menu), activity-states and life-cycle, interaction amongst activities. app-functionality beyond user interface- threads, async task, service –state and life cycle, notification, broad cast receivers, telephony and smsapis native data handling-on device file I/O, shared preferences, mobile database such as SQLite, and enterprise data access(via Internet/Intranet) [15]
3. **Sprucing up mobile apps:** Graphics and animation- custom views, canvas, animation APIs, multimedia-audio/video playback and record, location awareness, and native hardware access (sensor such as accelerometer and gyroscope). [8]
4. **Testing mobile apps:** Debugging mobile apps, whiteboxtesting,blackbox testing, and test automation of mobile app, JUnit for Android, Robotium, Monkey Talk. [6]
5. **Taking apps to market:** Versioning signing and packaging mobileapps, distributing apps on mobile market place. [3]

Outcome(s): On successful completion of this course, students will be able to

- Understand the android operating system in details
- Create mobile application for various screens
- Deploy on play store market
- Use various sensors available in mobile

Text Books:

1. Barry Burd, Android Application Development All in One for Dummies, Johen Wiley & Sons Inc., Edition I , 2011.

2. Anubhav Pradhan ,Anil V Deshpandy, Mobile App Development, Edition I

Reference Books: 1.Lauren Darcey, Shane Conder,"Teach Yourself Android Application Development in 24 Hours",Sams Publishing, 2012, 2nd Edition , 2012.

CS-14.451 **Soft Computing Laboratory** **Credit: 0-0-2-1**

Prerequisite(s): CS14.111(Programming Language Laboratory)

Objective(s):

- To implement heuristic search techniques.
- To implement neural networks for solving problems.
- To solve problems using fuzzy logic.
- To implement genetic algorithms.

Content: Lab manual based upon the theory course CS 14.401 and to achieve the listed course objectives and outcomes

Outcome(s): On successful completion of this course, the students will be able to

- Implement soft computing techniques for different problems.
- Develop soft computing models to handle non deterministic problems.
- Analyze and synthesize the performance of developed solution with relevant parameters.

CS-14.455 **Digital Image Processing Laboratory** **Credit: 0-0-2-1**

Prerequisite(s): CS14.111(Programming Language Laboratory)

Objective(s):

- To implement image transforms and analyze their performance.
- To implement image enhancement methods.
- To apply morphological operations on images.
- To implement image compression algorithms and analyze the efficiency.

Lab manual based upon the theory course CS 14.405 and to achieve the listed course objectives and outcomes

Outcome(s): On successful completion of this course, the students will be able to

- Apply basic operations on an image like read, write, binarizeetc.
- Apply image transforms and analyze their performance.
- Develop morphing algorithms as per the need.
- Extract features from image using segmentation.
- Compress a given image and analyze its performance.

CS-14.471 **Minor Project** **Credit: 0-0-0-5**

Prerequisite(s): CS14.111(Programming Language Laboratory)

Objective(s):

- To identify and formulate an engineering problem.
- To design a model or process to solve the formulated problem.
- To develop the solution by implementing the proposed design.
- To work in team to contribute to the development of project.
- To analyze and synthesize the product against critical and relevant parameters.

Content: Students will develop (preferably in a team) a project under guidance of faculty member based upon the area of interest of both student and faculty member.

Outcome(s): Preferably should cover most of the student outcomes.

CS-14.473 **Industrial Training Seminar** **Credit: 0-0-0-2**

Prerequisite(s): NIL

Objective(s):

- To observe and analyze the problem solving process/model on ground.
- To comprehend the acquired knowledge on field.
- To get some hands on practice on relevant technologies used in real life problem solving.
- To present the acquired knowledge to larger audience.

Content:

Students have to present the findings/observation while at training at some industry. They have to submit a report also clearly mentioning the outcomes of the training.

Outcome(s):

On successful completion of this course, the students will be able to

- Communicate effectively to arrange of audience.
- Recognize the need for continuous learning.
- Analyze and synthesize engineering problems and their solutions.

CS 14.402 **Distributed Systems** **Total Lectures: 40**

Credit: 3-0-0-3

Prerequisite(s): CS 14.202 (Java Programming), CS 14.303 (Operating Systems), CS 14.306 (Computer Networks)

Objective(s): To make students aware of:

- What a distributed system is, its example, use and utilities.
- Hardware and software requirements/constraints for implementation of distributed systems.
- Abstractions like, RMI, distributed objects, RPC, distributed shared memory etc.
- Notion of time in a distributed system.
- Databases in a distributed system.

1. **Characterization of Distributed Systems:** Definition, distributed systems-Internet, intranet, mobile, ubiquitous computing, resource sharing and World Wide Web challenges-heterogeneity, openness, security scalability failure handling concurrency and transparency. [3]
2. **System Models:** Architecture models- software layers, system architecture, variations on client-server model, interfaces, design requirement for distributed architectures, fundamental and interaction models, and failure and security models. [4]
3. **Distributed Object and Remote Invocation:** Introduction to remote method invocation (RMI) and interface in distributed systems, communication between distributed objects-objects model, distributed objects, distributed objects model and design issues for RMI, implementation of RMI and distributed garbage collection, remote procedures call and sun RPC case study, events and notifications participants, JINI distributed event specification, Java RMI case study, building client and server programs, design and implementation of Java RMI. [8]
4. **Time and Global State:** Clocks, events and process states, synchronizing physical clocks-synchronization in a synchronous system, Cristian method for synchronizing clocks, Berkley algorithm, network time protocol, global state and consistent cuts. [5]
5. **Distributed Shared Memory:** Introduction, message passing versus DSM, implementation approaches to DSM, design and implementation issues-structure and synchronization model. [5]
6. **Distributed Database Systems:** Distributed DBMS architecture, distributed database design, alternate design strategies, distribution design issues, fragmentation, and allocation. [5]
7. **Processes and Processors in Distributed Systems:** Threads, system models, processor allocation, scheduling, fault tolerance. [5]
8. **Distributed File System:** Design, implementation, trends in distributed file system. [5]

Outcome(s): On successful completion of the course the student will be able to:

- Understand the concept of distributed systems.
- Explain the principles underlying the functioning of distributed systems as well as how these principles are applied in distributed systems.
- Comprehend the problems and challenges of distributed systems.
- Understand and estimate the impact of different design choices, system features on distributed systems.

Text Books:

1. Colouris, “Distributed Systems Concepts and Design”, Addison Wesley, 5th edition, 2011.
2. George Coulouris, Jean Dollimore, Tim Kindberg, Gordon Blair,"Distributed Systems" , Pearson Education Limited, 2013

Reference Books:

1. Pradeep K. Sinha,"Distributed Operating Systems",PHI Learning Pvt. Limited, 2011.
2. MukeshSinghal, NiranjanShivrathri, “Advanced Concepts in Operating Systems”, TMH,

2011.

CS 14.412 **Software Project Management** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): CS 14.302 (Software Engineering)

Objective(s):

- To introduce the concepts of Software Project Management to the students.
- To make the students understand the requirement for project evaluation.
- To make the students understand the requirement for Software quality assurance and project management along with its tools.

1. **Introduction to Software Project Management (SPM) : S**oftware Engineering problem and software product, software product attributes, definition of a Software Project (SP), SP vs. other types of projects activities covered by SPM, categorizing SPs, Project Management cycle, SPM framework, types of project plan **[6]**
2. **Project Evaluation:** Strategic assessment, technical assessment, cost benefit analysis, cash flow forecasting, cost benefit evaluation techniques, risk evaluation **[5]**
3. **Activity Planning:** Objectives, project schedule, sequencing and scheduling activities, networkplanning models, forward pass, backward pass, activity float, shortening projectduration, activity on arrow networks, risk management, nature of risk, types ofrisk, managing risk, hazard identification, hazard analysis, risk planning and control **[8]**
4. **Monitoring and Control:** Introduction, creating the frame work, collecting the data, visualizing progress, cost monitoring, earned value, prioritizing monitoring, getting the project back to target, change control **[6]**
5. **Managing people and Organizing teams:**Introduction,understandingbehaviour, organizational behaviour: a background,selecting the right person for the job, instruction in the best methods, motivation, the Oldman, Hackman job characteristics model, working in groups, becominga team, decision making leadership, organizational structures, stress, health and safety, case studies **[8]**
6. **Software Quality Assurance and Testing:** Testing principles and objectives, test plan, types and levels of testing, test strategies, program verification and validation, software quality, SEI-CMM,SQA activities, QA organization structure, SQA plan **[7]**

Outcome(s):

Upon completion of the course the student should be able to:

- Examine the fundamentals of the software project and the factors involved in using a methodology in the context of project management.
- Explain the risks, issues, and critical success factors associated with technology projects and software projects in particular.
- Create a project plan, including scope definition, risk assessment, task breakdown, team selection, estimates, communication mechanisms and progress evaluation and reporting using an appropriate project lifecycle.
- Present and justify a fully documented project plan.
- Employ appropriate software for project planning, estimation, monitoring and control, communication and reporting.

Text Books:

1. Bob Hughes, Mikecotterell, “Software Project Management”, Fourth Edition, Tata McGraw Hill, 2009.

2. AshfaqueAhmed,"Software Project Management: A Process-Driven Approach",CRC Press, 2016.

Reference Books:

1. **Ramesh, Gopalaswamy, "Managing Global Projects", Tata McGraw Hill**,2nd ed. 2005.
2. Royce, “Software Project Management”, Pearson Education, 1999.
3. Walker Royce ,Software Project Management, , 1998, Addison Wesley.

CS 14.414 **Technologies of Big Data** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 14.415 (Data Science and Big Data and Analytics)

Objective(s): To understand and learn various technologies of Big Data Analytics and apply them to solve real world problems.

1. **Hadoop and MapReduce** :Functional programming , MapReduce programming, running a MapReduce programs on Hadoop, word count, distributed sort, distributed grep. [7]

2. **Hive**: Hive, HiveQL vs SQL, Hive in Hadoop ecosystem, installation of Hive, query execution in Hive, data types and file formats, create table, alter table, drop table, loading data into tables, select-from clause, where clause ,group by clause, join statements, views and indexes. [10]

3. **Pig**: Pig , PigLatin, Pig on Hadoop, installing and running Pig, Grunt, Pig data models, load, store and dump, relational operations-foreach, filter, groupby, orderby, distinct, Join, user defined functions(UDFs),developing and testing PigLatin scripts. [10]

4. **Spark** : Spark, Hadoop versus Spark, Installation of spark, spark architecture, solving business problem with Spark, Spark streaming framework and processing models. [7]

5. **NoSQL Databases** :NoSQL, database scaling, CAP theorem , ACID versus BASE, key – value stores, column oriented databases, document databases ,graph databases, NoSQL challenges. [6]

Outcome(s): On successful completion of this course, students would be able to

- Apply learning and knowledge of Big Data technologies tosolve real world problems and acquire required skills set for industry.

Text Books:

1. Chuck Lam, “Hadoop in Action”, Manning Publications,2nd ed. 2015, ISBN: 9781935182191
2. Edward Capriolo, Dean Wampler, Jason Rutherglen,“Programming Hive”, O’Reilly Media,2016,ISBN: 978-1-449-31933-5

Reference Books:

1. Alan Gates, “Programming Pig”, O’Reilly Media,2011,ISBN: 978-1-449-30264-1
2. James A. Scott, “Getting Started with Apache Spark”, MapR Technologies,2015

CS 14.416 **Designing of IoT** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 14.101 (Programming Languages), CS 14.303 (Operating System), CS 14.306 (Computer Networks)

Objective(s):
- To understand IoT architecture and IoT design constraints
- To understand the vision and impact of IoT
- Understand IoT Market perspective.

1. **Internet/Web and Networking Basics** : OSI Model, data transfer referred with OSI model, IP addressing, point to point data transfer, point to multi point data transfer & network topologies, sub-netting, network topologies referred with web, introduction to web servers, introduction to cloud computing [5]
2. **IoT Platform Overview:** Overview of IoT supported hardware platforms such as: raspberry pi, ARM cortex processors, arduino and intel galileo boards, network fundamentals: overview and working principle of wired networking equipment's – router, switches, overview and working principle of wireless networking equipment's – access points, hubs etc. linux network configuration concepts: networking configurations in linux accessing hardware & device files interactions. [7]
3. **IoT Architecture:** History of IoT, M2M – machine to machine, web of things, IoT protocols, remote monitoring & sensing, remote controlling, performance analysis, the layering concepts , IoT communication pattern, IoT protocol architecture, the 6LoWPAN, security aspects in IoT. [8]
4. **IoT Application Development**: MQTT, REST/HTTP, CoAP, MySQL, apache for handling HTTP Requests, PHP & MySQL for data processing, MongoDB object type database, HTML, CSS & jQuery for UI designing, JSON lib for data processing, security & privacy during development, application development for mobile platforms: overview of android / IOS app development tools. [13]
5. **Case Study & advanced IoT Applications:**IoT applications in home, infrastructures, buildings, security, Industries, home appliances, other IoT electronic equipments, use of big data and visualization in IoT, industry 4.0 concepts, sensors and sensor node and interfacing using any embedded target boards (Raspberry Pi / Intel Galileo/ARM Cortex/ Arduino) [7]

Outcome(s): On successful completion of this course, students will be able to:
- Explain the current status and expected future directions of the internet of things.
- Identify and propose applications which advance the IoT.
- Develop applications which advance the IoT.

Text Books:

1. Dr.OvidiuVermesan, Dr. Peter Friess, "Internet of Things: Converging Technologies for Smart Environments and Integrated Ecosystems", River Publishers,2013
2. Jean-Philippe Vasseur, Adam Dunkels, "Interconnecting Smart Objects with IP: The Next Internet", Morgan Kuffmann, 2010.
3. Zach Shelby, Carsten Bormann, "6LoWPAN: The Wireless Embedded Internet", Wiley, 2011.

Reference Books:

1. Asoke K Talukder and Roopa R Yavagal, "Mobile Computing", 4th ed. Tata McGraw Hill, 2010.
2. F. Adelstein and S.K.S. Gupta, "Fundamentals of Mobile and Pervasive Computing", McGraw Hill, 2009.

ET 474 **Enterprise Computing – II** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 463 (Enterprise Computing – I)

Objective(s):
- To define advance JCL.
- To provide an in-depth and comprehensive knowledge of the hardware and software architecture of enterprise system.
- To introduce about the enterprise standards.

1. **Advanced JCL:** Coding a JCL, using PROCS (Catalog and In-Stream), using DFSORT, ICETOOL. [8]
2. **Advanced Datasets:** Understanding record length, allocation of SPACE, fixed and variable record length, VSAM, defining VSAM, understanding CI and CA, GDG, understanding usage of GDG, defining GDG. [12]
3. **Understanding CICS:** CICS fundamentals, understanding transactions, pseudo conversational programming, understanding CICS tables, coding BMS maps, compiling of a CICS program & NEWCOPY + CEMT entry for programs, writing simple CICS program to read key data (say StudentID) from user & display details obtained from a VSAM, CICS tables for VSAM/DB2 will be provided. [20]

Outcome(s): On successful completion of this course, students will be able to
- Describe the hardware and software architecture of an actual enterprise platform and explain the main functionality of the physical and virtual components.
- Perform basic administrative tasks in an enterprise computer system such as: the creation of new users, job monitoring and management, and back-ups and re- store operations.
- Possess basic practical knowledge regarding the process of installing, configuring and operating applications in an enterprise computer system as well as applying updates to the operating system

Text Book:

1. IBM Mainframe Handbook by Alex Leon.
4. Alan Simon, "Network Re-engineering: Foundations of Enterprise Computing", Academic Press, 2012.
2. Mike Ebbers, John Kettner, Wayne O'Brien, Bill Ogden, IBM Redbooks, "Introduction to the New Mainframe: z/OS Basics", IBM Redbooks, 2012.

CS 14.422 **Software Testing and Quality Assurance** **Total Lectures: 40**
Credit: 3-1-0 -4

Prerequisite(s): CS 14.302 (Software Engineering)

Objective(s):

- To explore the basics and goals of software testing
- To discuss various types of software testing and its techniques
- To list out various tools that can be used for automating the testing process
- To introduce various software quality standards for establishing quality environment
- To discuss various methods and evaluation procedures for improving the quality Models

1. **Basics of Software Testing**: Definition, test cases, insights from a Venn diagram, identifying test cases, error and fault taxonomies, levels of testing, examples: generalized pseudo-code, the triangle problem, the NextDate problem, the commission problem [6]
2. **Decision Table Based Testing:** Decision tables, test cases for triangle problem, test cases for Next Date problem, test cases for commission problem, data flow testing, use testing, slice based testing, guidelines and observation, traditional view of testing levels, alternative life-cycle models, separating integration and system testing, decomposition based, call graph based, path based integration, case study [10]
3. **System and Interaction Testing:** Threads, basic concepts of requirements specification, finding threads, structural strategies and functional strategies for thread testing, SATM test threads, system testing guidelines, interaction testing, a taxonomy of interactions, composition, and determinism, client-server testing, issues in object-oriented testing, inheritance and polymorphism, levels of object-oriented testing, GUI testing, dataflow testing for object-oriented software, examples and case study [10]
4. **Object-Oriented Integration Testing**: UML support for integration testing, MM paths for object-oriented software, GUI testing, unit testing, object-oriented system testing, UML based system testing, statechart based system testing [6]
5. **Quality Assurance:** Software quality, level of measurement, reliability and validity, Ishikawa's seven basic tools, cause and effect diagram, reliability models, quality and quality management metrics, software process maturity assessment [8]

Outcome(s): On successful completion the students will be able to:

- Compare and pick out the right type of software testing process for any given real world problem
- Carry out the software testing process in efficient way
- Automate the testing process by using several testing tools
- Establish a quality environment as specified in standards for developing quality software
- Analyze and improve the quality procedures based on the past experience

Text Books:

1. Paul C. Jorgensen, "Software Testing: A Craftsman's Approach", Auerbach Publications, 4th Edition, 2016.
2. Stephen H Khan, "Metrics and Models in Software Quality Engineering", Pearson, 2nd edition 2013.

Reference Books:

1. CemKaner, Rebecca L. Fiedler,"Foundations of Software Testing" , Context-Driven Press, 2013
2. Aditya P Mathur, " Foundations of Software Testing", Pearson, 2008.
3. Mauro Pezze, Michal Young,"Software Testing and Analysis – Process, Principles and Techniques", John Wiley & Sons, 2008.

CS 14.424 **Machine Learning with Big Data** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 14.322 (Data Mining)

Objective(s): To learn the fundamental concept of machine learning and apply the concept of recommendations, clustering and classifications on large scale data sets using mahout.

1. **Introduction**: learning problems, designing learning system, perspectives and issues, concept learning, version spaces and candidate elimination algorithm, inductive bias, decision tree learning, representation, heuristic space search [8]
2. **Data Mining, Machine Learning** : Data mining ,machine learning, statistical modeling, feature extraction, computational approaches to modeling, statistical limits on data mining, statistical limits on data mining, Bonferroni's principle, recommendation engines, clustering and classifications, mahout : Mahout, installation and setting up of Mahout, tackling large scale data with mahout and Hadoop [8]
3. **Recommendations:** Defining recommendation, Running a recommender engine, Evaluating a recommender, Evaluating precision and recall, evaluating the GroupLens data set, representing preference data, in-memory data models, coping without preference values, user-based recommendation, item-based recommendation, similarity metrics, slope-one recommender, distributing recommendation computations [8]
4. **Clustering**: Clustering basics, measuring the similarity of items, running a simple clustering example, distance measures, representing data, visualizing vectors, representing text documents as vectors, generating vectors from documents, clustering algorithms in Mahout, k-means clustering, different kinds of clustering problems, fuzzy k-means clustering, model-based clustering, evaluating and improving clustering quality, real-world applications of clustering [8]
5. **Classifications**:Introduction to classification, Mahout for classification, differences between classification, recommendation, and clustering, applications of classification, working of classification, training a classifier, extracting features to build a Mahout classifier, preprocessing raw data into classifiable data, converting classifiable data into vectors, evaluating and tuning a classifier, deploying a classifier [8]

Outcome(s): Students would be able to apply learning and knowledge of machine learning techniquesin the area of Big Data Analytics using Mahoutto solve real life problems.

Text Books:

1. Sean Owen, Robin Anil, Ted dunning, Ellen friedman, "Mahout in Action",Manning Publications,2012,ISBN 9781935182689
2. Jared Dean,"Big Data, Data Mining, and Machine Learning: Value Creation for Business Leaders and Practitioners", Wiley,2014, ISBN: 978-1-118-61804-2
3. Tom M. Mitchell, "Machine Learning", McGraw Hill , 2013

Reference Books:

1. Suthaharan, Shan, "Machine Learning Models and Algorithms for Big Data Classification ", Springer,2016,ISBN 978-1-4899-7641-3
2. AnandRajaraman, Jure Leskovec, Jeffrey D. Ullman, "Mining of Massive Datasets", Cambridge University Press, 2015,ISBN:978-1-107-07723-2

CS 14.426 **Wireless and Sensor Networks** **Total Lectures: 40**
Credit: 3-1-0 -4

Prerequisite(s): CS 14.306 (Computer Networks)

Objective(s):

- To provide an overview about wireless and sensor networks and emerging technologies
- To study about the network architecture of sensor nodes and its execution environment
- To understand the concepts of communication, MAC and routing protocols in WSN
- To learn about topology control and clustering for localization services with sensor tasking and control
- To study about sensor node hardware and software platforms and understand the simulation and programming techniques

1. **Overview of Wireless Sensor Networks**: Introduction, characteristics, challenges for WSN, emerging technologies for WSN, advantages of sensor networks, applications. [8]
2. **Architecture:** Single-node architecture, hardware components, energy consumption of sensor nodes, operating system and execution environment, network architecture, single hop vs multi hop, multiple sources and sinks, optimization goals and figures of merit, WSN gateway and tunneling. [8]
3. **Networking Sensors:** Physical layer, MAC protocols for WSN, low duty cycle and wakeup concept S-MAC, address and name management, assignment of MAC addresses, routing protocols, multipath unicast routing, energy efficient routing, geographic routing. [8]
4. **Infrastructure**: Topology control, clustering, multilayer clustering, time synchronization, localization and positioning, positioning in multihop environment, ranging techniques, range based localization, sensor tasking and control, information based sensor tasking, joint routing and information aggregation [8]
5. **Platforms and Tools:** Sensor node hardware, Berkeley motes, programming challenges, node level software platforms, TinyOS, nesC, TinyGALS, simulators, ns2, TOSSIM, state centric programming [8]

Outcome(s): On successful completion the students will be able to:

- Compare and pick out the right type of software testing process for any given real world problem
- Carry out the software testing process in efficient way
- Automate the testing process by using several testing tools
- Establish a quality environment as specified in standards for developing quality software
- Analyze and improve the quality procedures based on the past experience

Text Books:

1. Holger Karl & Andreas Willig, " Protocols And Architectures for Wireless Sensor Networks" , John Wiley, 2007.
2. Feng Zhao, Leonidas Guibas, Jie Liu, , “Wireless Sensor Networks- An Information Processing Approach", 2nd ed. Elsevier, 2016.

Reference Books:

1. KazemSohraby, Daniel Minoli, &TaiebZnati, “Wireless Sensor Networks- Technology, Protocols, And Applications”, John Wiley, 2007.
2. Anna Hac, “Wireless Sensor Network Designs”, John Wiley, 2003.

CS 14.418 **Software Defined Networking** **Total Lectures: 40**
Credit: 3-1-0 -4

Prerequisite(s): CS 14.302 (Software Engineering), CS 14.306 (Computer Networks)

Objective(s):

- To explore the basics of SDN
- To discuss various types plane
- To list out various controllers
- To program a simple SDN

1. **Control and Data Planes**: Introduction, evolution vs revolution, the control plane, data plane, moving information between planes, distributed control planes, convergence time, load balancing, creating the MPLS overlay, centralized control planes, logical vs literal, ATM.LANE, route servers. [8]
2. **SDN Controllers:** Wire protocol, replication, FAWG, hybrid approaches, SDN controllers, VMware, Nicira, OpenFlow, Mininet, NOX/POX, Trema, Ryu, L3VPN, RSPV-TE problem statement, bin-packing, deadlock, Plexxi, Cisco OnePK. [8]
3. **Network Programmability:** The management interface, the application-network divide, NETCONF and NETMOD, SNMP, modern programmatic interface, XMPP, JSON, I2RS, OpenStack, CloudStack, Puppet, virtual multitenant data center, SDN solution for data center networks. [8]
4. **Network Function Virtualization**: Virtualization and data plane I/O, services engineered path, service locations and chaining, NFV at ETSI, non-ETSI NFV work, network topology, LLDP, BGP-TE/LS, ALTO, I2RS topology. [8]
5. **Building an SDN framework:** Build code first, ask questions later, the Juniper SDN framework, IETF SDN framework, open daylight controller/framework, use cases for bandwidth scheduling, manipulation, data center overlays, big data, NFV, and traffic monitoring. [8]

Outcome(s): On successful completion the students will be able to:

- Describe the key benefits of SDN
- Describe the data plane
- Configure an SDN friendly network emulator
- Program a simple SDN for a given task using a low level approach and high level approach
- Evaluate a sample SDNs performance and reliability

Text Books:

1. Ken Gray, Thomas D Nadeau, “SDN: Software Defined Networks”, O’Reilly, 2013.

Reference Books:

1. Paul Goransson, Chuck Black, “Software Defined Networks: A Comprehensive Approach”, Morgan Kaufmann, First edition, 2014 .
2. Vishal Shukla, “Introduction to Software Defined Networking – OpenFlow&VxLAN”, Createspace, 2013.

CS-14.452 **Distributed Systems Laboratory** **Credit: 0-0-2-1**

Prerequisite(s): CS14.111(Programming Language Laboratory), CS 14.222(Java Programming Lab.)

Objective(s):

- To implement different abstractions of distributed systems.
- To understand the working principle of different theoretical abstractions like RMI, RPC, distributed shared memory etc.
- To understand the notion of logical clocks and event ordering in asynchronous distributed system through implementation

Content: Lab manual based upon the theory course CS 14.402 and to achieve the listed course objectives and outcomes

Outcome(s): On successful completion of this course, the students will be able to

- Analyze the working principles of different distributed system abstractions.
- Formulate programming models for DS concepts like RMI, RPC, distributed shared memory etc.
- Recognize event ordering in an asynchronous distributed system.

CS-14.472 **Major Project** **Credit: 0-0-0-10**

Prerequisite(s): CS14.111(Programming Language Laboratory)

Objective(s):

- To identify and formulate an engineering problem.
- To design a model or process to solve the formulated problem.
- To develop the solution by implementing the proposed design.
- To work in team to contribute to the development of project.
- To analyze and synthesize the product against critical and relevant parameters.

Content: Students will develop (preferably in a team) a project under guidance of faculty member based upon the area of interest of both student and faculty member.

Outcome(s): Preferably should cover most of the student outcomes.

CS-14.474 **Technical Seminar** **Credit: 0-0-0-1**

Prerequisite(s): NIL

Objective(s):

- To observe and analyze some latest technology.
- To comprehend the acquired knowledge.
- To present the acquired knowledge to larger audience.

Content:

Students have to comprehend and present on some latest development in the field of computing. They have to submit a report also clearly mentioning the significance and limitations of the technology and its social impact.

Outcome(s):

On successful completion of this course, the students will be able to

- Communicate effectively to arrange of audience.
- Recognize the need for continuous learning.
- Recognize the social impact of engineering solutions.

CS-14.301 **Design and Analysis of Algorithms** **Total Lectures: 40**
Credit:3-1-0-4

Prerequisite(s): CS-14.201(Discrete Structures), CS-14.203(Data Structures)

Objective(s):

- To learn the algorithm analysis techniques.
- To become familiar with the different algorithm design techniques.
- To understand the limitations of the algorithms power.

1. **Introduction:** Fundamentals of algorithms and problem solving, asymptotic notations, time complexity and analysis of algorithms, solutions of recurrence relations, master theorem and summations techniques. [8]
2. **Analysis of Sorting and Searching Algorithms:** Linear, binary and interpolation search, insertion, selection, merge, quick and heap sort, stability and other issues, hashing. [8]
3. **Algorithm Design Approaches:** Greedy method (knapsack problem, job sequencing problem), dynamic programming (assembly line scheduling, matrix chain multiplication), backtracking (8 queens problem, sum of subsets), branch and bound (0/1 knapsack problem), divide and conquer algorithms (Strassen matrix multiplication), problems based on these design paradigms. [8]
4. **Tree and Graph algorithms:** Spanning trees, Prim and Kruskal's algorithm, Huffman coding, BFS and DFS, disjoint set operations, connected components, shortest path algorithms in a graph such as Dijkstra, Bellman Ford, Warshall's etc. [8]
5. **Complexity Classes:** P,NP,NP hard and NP complete problems, reducibility, decision and optimization problems, examples of NP complete problems such as 3 CNF, clique, vertex cover and traveling salesman problem, basic introduction of approximation algorithms. [8]

Outcome(s): On the successful completion of the course, the student will be able to:

- Design algorithms for various computing problems.
- Analyze the time and space complexity of algorithms.
- Critically analyze the different algorithm design techniques for a given problem.
- Modify existing algorithms to improve efficiency.

Text Books:

5. Thomas H.Cormen, Charles E.Leiserson, Ronald L. Rivest and Clifford Stein, Introduction to Algorithms, PHI Learning Private Limited, 3rd edition, 2016.
6. Ellis Horowitz, SartajSahni, SanguthevarRajasekaran, Computer Algorithms, Silicon Press, 2nd edition, 2008.

Reference Books:

7. Anany Levitin, Introduction to the Design and Analysis of Algorithms, Pearson Education, 3rd edition, 2012.
8. Alfred V. Aho, John E. Hopcroft and Jeffrey D. Ullman, Data Structures and Algorithms, Pearson Education, 1st edition, 2006.
9. Donald E. Knuth, The Art of Computer Programming, Volumes 1& 3, Pearson Education, 2009.
10. Steven S. Skiena, The Algorithm Design Manual, Springer, 2nd edition, 2008.

CS-14.303 **Operating System** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS-14.207 (Computer Information System)

Objective(s):

- Understand the fundamental operating system abstractions like processes, threads, files, semaphores, IPC and deadlocks.
- Understand operating system from user's perspective as well as from system's perspective.
- Understand the principles of concurrency and synchronization.
- Understand basic resource management techniques.
- Understand different theoretical principles in depth through hands on high level programming.

7. **Overview:** Definition, types of operating systems: mainframe, server, multiprocessor, personal computer, real-time, embedded and smart card, system calls and utilities, batch, multiprogramming and multitasking operating system. [3]
8. **File Systems:** File concept, user and system programmer view of file systems, different modules of a file system, disk structure, disk-space allocation methods: contiguous, linked, indexed directory structures, file protection, disk scheduling algorithms. [6]
9. **Process Management:** Process concepts, threads, scheduling concepts, types of schedulers, scheduling algorithms, process state diagram, comparison of various CPU scheduling algorithms, multi-level queue scheduling. [6]
10. **Memory Management:** Logical and physical address spaces, base, limit and relocation registers, address binding, dynamic loading and linking, partitioning, swapping, contiguous memory allocation, non-contiguous memory allocation: segmentation, paging and segmentation. [8]
11. **Process Synchronization and deadlock:** Independent and concurrent processes, shared memory approach and message passing approach, mutual exclusion, synchronization, inter process communication, critical section problem and its solution to semaphores: binary and counting semaphores, wait/signal operations and their implementation, classical problems of synchronization, deadlock. [11]
12. **Case Studies:** Windows, UNIX and Linux: scheduling and memory management. [6]

Outcome(s): On successful completion of this course, students will be able to

- Analyze the primary functionalities of operating system.
- Manage system resources efficiently as an operating system designer.
- Develop new operating systems as well as work on existing ones to develop them further.

Text Books:

CS-14.305 **Logic in Computer Science** **Total Lectures: 40**
Credit: 3-0-0-3

Prerequisite(s): CS-14.201(Discrete Structures), CS-14.207(Computer Information Systems)

Objective(s):

- To introduce the main notions of mathematical logic: logical notations (syntax) and how to assign meaning to them (semantics).
- To study formal frameworks (in the sense of being rigorous as well as in the sense of manipulating "form") for constructing logical arguments (proof theory).
- To study some deductive systems for propositional and first-order logic.
- To introduce the concept of fuzzy logic.

6. **Introduction:** Role of logic in computer science, problem representation, review of the principle of mathematical induction, the principle of structural induction, review of Boolean algebra, language, models, interpretations, validity, proof, decision problems in logic, decidability. [6]
7. **Propositional Logic:** Syntax, semantics, logical and algebraic concepts, identities and normal forms, tautology checking, propositional satisfiability, propositional resolution and tableaux method. [10]
8. **First Order Predicate Logic:** Quantifiers, first order models, validity and satisfiability, forward and backward chaining, Skolmization, normal forms, unification, Horn formulas and programs, resolution and tableaux. [12]
9. **Binary Decision Diagrams:** Representing Boolean functions, algorithms for ordered reduced binary decision diagram (OBDD), geometric templates from spatial relations, image based rendering, symbolic model checking, relational Mu-calculus, coding CTL models and specification [8]
10. **Fuzzy Logic:** Classic sets, fuzzy sets and membership, fuzzy set operations, Cartesian product, operations and properties of crisp relationship, operations and properties of fuzzy relationship. [4]

Outcome(s): On successful completion of this course, the students will be able to

- Use propositional and first-order logic.
- Apply of logic in specifying properties.
- Develop proof by induction.
- Design binary decision diagrams.
- Identify the scope for fuzzy logic.

CS 14.309 **Microprocessor and Assembly Language Programming** **Total Lectures: 40**
Credit: 3-0-0 -3

Prerequisite(s): CS 14.207 (Computer Information System)

Objective(s):
- To study architecture and memory management of 8-bit and 16-bit microprocessor (8085 & 8086)
- To study assembly language programming and use it to solve various problems.

6. **Introduction:** Evolution of Microprocessor and its types, 8085 microprocessor architecture, buses, registers, flags, 8085 pin configuration & function. [6]
7. **8085 Instruction Set:** Addressing modes of 8085, 8085 instruction set, data transfer arithmetic, logical and branch instructions, 8085 interrupt structure, limitations of 8085 microprocessor. [8]
8. **Interfacing:** Memory mapped I/O, I/O mapped I/O, address decoding, interfacing of memory with 8085, interfacing of I/O with 8085. [8]
9. **Advance Microprocessors:** 8086 microprocessor architecture, 8086 pin configuration & function, addressing modes of 8086, instruction set of 8086, 8086 interrupts, study of advance processors of the family (8088, 80286, 80386, 80486 and Pentium). [10]
10. **Assembly Language Programming:** Introduction, assembler directives, looping, condition and jump, subroutines, procedures, macros, parameter passing. [8]

Outcome(s): On successful completion of this course, students will be able to:
- Draw block diagram of 8085/86 processor and know the pin function
- Know the instruction set and addressing modes
- Write the assembly language program for different problems and know the use of procedures and macros.
- Design interface of memory chips.

MT 201 **Engineering Economics** **Total Lectures: 24Credit: 2-0-0-2**

Prerequisite(s): NIL

Objective(s):

- To know about the basic concepts of Engineering Economics and its role in Indian economy.
- To understand about the elements of economics with application to the industrial sector and its impact on Economy.
- To discuss about the market demand analysis, production analysis and pricing mechanism for decision making.
- To find the role of consumer perception in market demand and its features and infrastructure development in India.
- To discuss about cost analysis and optimization techniques with multiple objectives.

6. **Introduction to Engineering Economics:**Origin, principles, engineering economics and design process, engineering for economic competitiveness, engineering economy and the engineer. [3]
7. **Elements of Economics:**Definition, demand and supply, income, equilibrium, utility. [3]
8. **Economics applied to Industries:**Market demand analysis, production analysis for decision Making, cost analysis, pricing techniques in regards of goods and services, break even analysis, interest, annuities and profits. [12]
9. **Replacement Analysis:**Capital recovery, depreciation methods for replacement studies. [2]
10. **Optimization Techniques:**Economics and optimization, price mechanism and optimal resource allocation, optimization under constraints, optimization under risk and uncertainty, [4]

Outcome(s): Students would

- Be able to perform and evaluate payback period and capitalized cost on one or more than one economic alternatives.
- Be able to carry out and evaluate the benefit/cost, break even analysis on one or more alternatives.
- Have the knowledge of fundamentals of Engineering Economics for the purpose of economic condition of the country.

Text Books:

CS 14.315 **Python Programming** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): Programming Language (CS 14.101)

Objective(s): Python is a general-purpose, versatile and popular programming language. It's great as a first language because it is concise and easy to read, and it is also a good language to have in any programmer's stack as it can be used for everything from web development to software development and scientific applications.

11. **Introduction**: The basic elements of python, python syntax, compiled vs interpreted languages, formal and natural languages, built in python types, python as a calculator, basic input, branching programs, control structures, strings, tuples, lists and input iteration. [6]
12. **Functions and Abstraction**: Functions and scoping flow of execution, specifications, recursion, global variables, modules, stack diagrams, files, system functions and parameters, input and output, making your own module. [7]
13. **Structured Types and Higher-Order Functions**: Mutability strings, tuples, lists and dictionaries, lists and mutability, functions as Objects. [5]
14. **Classes and Object-Oriented Programming and Data Structure**: Abstract data types and classes, inheritance, encapsulation and information hiding, simple algorithms and data structures, list, tuple, sequence, set, search algorithms, sorting algorithms, hash tables. [8]
15. **Testing and Debugging**: Exceptions and assertions, types of testing – black-box and glass-box, debugging, handling exceptions, assertions. [6]
16. **Advance Python:** Regular expressions – REs and Python, plotting using PyLab, networking and Multithreaded Programming – sockets, threads and processes, chat Application, security – encryption and decryption, classical cyphers, graphics and GUI programming – drawing using Turtle, Tkinter and Python, Other GUIs. [8]

Outcome(s): Upon completion of this course students will be

- Familiar with Python syntax.
- Able to use python to implement a given logic.

Text Books:

3. John V Guttag, Introduction to Computation and Programming using Python, Prentice Hall of India, 2nd Edition, 2013.

6. Allen Downey ,Think Python How to Think Like a Computer Scientist, Version 2.0.17, Green Tea Press Needham, Massachusetts,2012.

CS-14.317 **Advance Web Technology** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 14.207 (Computer Information System)

Objective(s):

- To learn the platform neutral fundamentals of secure, dynamic web application development.
- To learn how to implement a web application using one specific set of open source server side tools: PHP and MySQL.

5. **Introduction:**HTTPprotocol:request and response, web browser and web servers, concepts of effective web design, web design issues including browser, bandwidth and cache, display resolution, look and feel of the website, page layout and linking, user centric design, sitemap, planning and publishing website, designing effective navigation. [4]

6. **JavaScript and XML:** Client side scripting with JavaScript, variables, functions, conditions, loops and repetition, pop up boxes, advance JavaScript: JavaScript and objects, JavaScript own objects, the DOM and web, browser environments, manipulation using DOM, forms and validations, Introduction to XML, uses of XML, simple XML, XML key components, DTD and Schemas, using XML with application, transforming XML using XSL and XSLT. [12]

7. **PHP:** Introduction and basic syntax of PHP, decision and looping with examples, PHP and HTML, arrays, functions, browser control and detection, string, form processing, files, advance features: Cookies and sessions, Object Oriented Programming with PHP. [12]

8. **PHP and MySQL:** Basic commands with PHP examples, connection to server, creating database, selecting a database, listing database, listing table names, creating a table, inserting data, altering tables, queries, deleting database, deleting data and tables, PhpMyadmin and database bugs. [12]

Outcome(s): Upon completion of the course students will be able to:

- Use the JavaScript to develop the dynamic web pages.
- Use server side scripting with PHP to generate the web pages dynamically using the database connectivity.
- Develop the modern Web applications using the client and server side technologies and the web design fundamentals.

Text Books:

3. Luke Welling, Laura Thomson: PHP and MySQL Web Development, Pearson, 2016.
4. Robin Nixon: Learning PHP, MySQL, and JavaScript, O'Reilly Media, 2012.

Reference Books:

4. Elizabeth Naramore, Jason Gerner, Yann Le Scouarnec, Jeremy Stolz, MichaelK. Glass, Beginning PHP5, Apache, and MySQL Web Development, Wrox, 2005.
5. Developing Web Applications in PHP and AJAX, Harwani, McGrawHill, 2010.
6. W. Jason Gilmore: Beginning PHP and MySQL 5 From Novice to Professional, Apress, 2010.

CS- 14.319 **Advanced Java** **Total Lectures: 40Credit: 3-1-0-4**

Prerequisite(s): CS 14.202 (Java)

Objective(s): This course extends the study of Web Programming Fundamentals. Advanced concepts of program design, implementation and testing will be introduced with J2EE framework. Student will learn various concept of advance Java for implementation of small to medium sized application programs that illustrate professionally acceptable coding and performance standards.

1. **Introduction:** OOPS principle, class and objects, basics of HTML, web development introduction, web framework, J2EE building blocks, web application structure [3]
2. **Servlets:** Servlet needs, servlet request-response model, servlet life cycle (init, service, doGet, doPost), servlet configuration, scopes (session, request, page), servlet parameters, servlet context, forms processing (get, post), HTTP header processing, HTTP responses. [5]
3. **Java Server Pages**: JSP life cycle, JSP a servlets, creating dynamic content with use of JSP elements: expressions, scriptlets& declarations, JSP composition, redirecting, forwarding, accessing default objects (request, response, session, application, config, pageContext), error processing with use of JSP, Servlets vs. JSP pages [8]
4. **Session management**: Http session, the Http session interface session tracking: cookies, hidden fields, cookies and JSP, sending and receiving cookies. [4]
5. **Using Beans and tag libraries**: Separating presentation and business logic, JSP actions, JavaBeans, working with properties, <jsp:useBean>, <jsp:getProperty> and <jsp:setProperty>,using form parameters with Beans, custom tags, types of tags. [10]
6. **Web application:** Case study of a web application, the web.xml deployment descriptor, web.xml – document definition, web.xml – adding servlets, web.xml – mapping servlets, web.xml – sending parameters, web.xml – pre-loading servlets, web application archive, deployment of web application [10]

Outcome(s): Upon successful completion of this course you should be able to:

- Demonstrate knowledge of the advance Java along with object oriented development process and apply this understanding to the analysis and design of solutions for small to medium scale problems.
- Implement web application using all the feature of J2EE covered in the course.

Text Books:

3. By Martin Bond, Debbie Law, Andy Longshaw, Dan Haywood, Peter Roxburgh, Sams Teach Yourself J2EE in 21 Days, 2nd Edition,SAMS , 2004.
4. Phillip Hanna , Osborne, JSP 2.0: The Complete Reference, 2nd edition, McGraw-Hill,2003.

Reference Book:

2. Bryan Basham, Kathy Sierra & Bert Bets, Head First Servlets and JSP, 2nd Edition, , Oreilly publication, 2008.

CS-14.321 **Windows Programming** **Total Lectures:40 Credit : 3-1-0-4**

Prerequisite(s): CS-14.101(Programming Language)

Objective(s):

- To provide knowledge of windows programming using Visual Basic .NET.
- To focus on Visual Basic program structure, language syntax and implementation details.

7. **Overview of Windows Programming:** The Windows environment, history of Windows, aspects of Windows, Windows programming options, APIs and memory [4]

models, programming environment

8. **Visual Basic 2010:** The Visual Studio development environment, writing the code, building and deploying the application, working with Toolbox control,working with specific data types, working with operators, if…then structure, select case structure, the for…next loop, using counter variable, complex for…next loop, do loops, using timer object, processing errors by using try…catch statement, using finally clause, the exception object, using nested try…catch, the exit try statement. [12]
9. **Modules and Procedures:** Working with modules, creating public variables, creating procedures, writing sub procedure, passing arguments by value,working with array, using ReDim, the array class, working with object collections, for each…next loop, creating your own collection. [8]
10. **Designing User Interface:** Managing windows forms and controls at run time, adding graphics, the system drawing namespace, adding animation to your program, inheriting forms and creating base classes, working with printers. [6]
11. **Database:** Exploring text files, reading and writing text files, getting started with ADO.NET, SQL statements and LINQ, data presentation using DataGridView control. [6]
12. **Web Programming:** Creating websites and webpages using Visual Web Developer and ASP.NET, difference between webpages and web forms, server controls, HTML controls, using webpage designer, adding server controls to a webpage. [4]

Outcome(s): Upon completion of the course the student should be

- Able to analyze program requirements.
- Design/develop programs with GUI.
- Code program and develop interface using Visual Basic .NET.
- Perform tests, resolve defects and revise existing code.

Text Books:

1. Michael Halvorson, Microsoft Visual Basic 2010, Microsoft Press, 2010
2. Bradley and Millspaugh, Programming in Visual Basic 2010, Mcgraw-Hill, 2010

Reference Books:

1. Shelly Hoisington, Microsoft Visual Basic 2010 for Windows, Web, Office and Database Applications: Comprehensive, Cengage Learning, 2010.
2. Sheldon Bill et. al., Professional Visual Basic 2010 and .NET 4, John Wiley & Sons, 2010
3. Andrew Moore, Visual Studio 2010 All-in-one for Dummies, John Wiley & Sons, 2010

CS -14.323 **Shell Programming** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): Programming Language (CS 14.101)

Objective(s):
- To familiarize students with the Unix/Linux environment
- To learn the fundamentals of shell scripting/programming
- To familiarize students with basic Unix/Linux administration

6. **UNIX-Basic Concepts:** Introduction, file systems, visual editors, Unix philosophy and features, understanding the Unix commands and general purpose utilities and navigating the file system, the shell and kernel. [8]

7. **UNIX-Advanced Features:** File and directory structures, file systems and peripheral devices, handling ordinary files, file attributes. UNIX system administration, data blocks and i-nodes. [8]

8. **Unix Editors and Filters:** Vi Editor, simple filters, regular expression and grep family, advanced filters: sed and awk, awk pattern scanning and processing, awk arithmetic, operators and variables. [8]

9. **Shell Fundamentals:** Command syntax, Shell variables, pattern matching, escaping, command substitution, input /output redirection, pipes, tees, [6]

10. **Shell Scripting:** Bourne shell, C shell; scripts, meta characters and environment, shell programming and scripts, logical operators, control and looping statements and programs. Shell reliability, maintainability, efficiency, portability and usability. [10]

Outcome(s): After completion of the course students will be able to
- Work confidently in Unix/Linux environment
- Write shell scripts to automate various tasks
- Master the basics of Unix/Linux administration
- Understand the basic difference between high level programming and shell programming

Text Books:
3. Sumitabha Das, UNIX, Tata McGraw-Hill Companies, 4th edition, 2011.
4. **Cameron Newham, Learning the bash Shell:Unix Shell Programming, 3rdedition,O'Reilly Media,2009.**

Reference Books:
1. Bill Rosenblatt , Learning the Korn Shell, O'Reilly Media, 2002.
2. Mark G. Sobell ,A practical guide to Linux commands, editors, and shell programming, 2nded. Prentice Hall, 2013.

ET 465 **Agile Software Development** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS14.332 (Software Engineering)

Objective(s):

- To learn the fundamental principles and practices associated with each of the agile development methods.
- To learn how agile methods scale to large and distributed projects.
- To learn the essentials of collaboration as they apply to agile methods.
- To perform in-depth explorations into aspects of agile development that are particularly relevant to each student through detailed discussion sessions.

6. **Fundamentals of Agile:** The genesis of Agile, introduction and background, Agile manifesto and principles, overview of Scrum, extreme programming, feature driven development, lean software development, Agile project management, design and development practices in Agile projects, test driven development, continuous integration, refactoring, pair programming, simple design, user stories, Agile testing, Agile tools. [7]
7. **Agile Scrum Framework:** Introduction to Scrum, project phases, Agile estimation, planning game, product backlog, sprint backlog, iteration planning, user story definition, characteristics and content of user stories, acceptance tests and verifying stories, project velocity, burn down chart, sprint planning and retrospective, daily scrum, Scrum roles – product owner, Scrum master, Scrum team, Scrum case study, tools for Agile project management. [9]
8. **Agile Testing:** The Agile lifecycle and its impact on testing, test driven development (TDD), unit framework and tools for TDD, testing user stories – acceptance tests and scenarios, planning and managing testing cycle, exploratory testing, risk based testing, regression tests, test automation, tools to support the Agile tester, securing Agile software. [10]
9. **Agile Software Design and Development:** Agile design practices, role of design principles including single responsibility principle, open closed principle, Liskov substitution principle, interface segregation principles, dependency inversion principle, Agile design, need and significance of refactoring, refactoring techniques, continuous integration, automated build tools, version control. [10]
10. **Industry Trends:** Market scenario and adoption of Agile, Agile ALM, roles in an Agile project, Agile applicability, Agile in distributed teams, business benefits, challenges in Agile, risks and mitigation, Agile project on cloud, balancing Agility with discipline, Agile rapid development technologies. [4]

Outcome(s): On successful completion of this course, students will be able to

- Understand concept of agile software engineering and its advantages in software development. Recognize various agile methods.
- Design and manage a project using Scrum.
- Write user stories for project requirements.
- Write test cases for developing features.

Text Books:

4. Ken Schawber, Mike Beedle, Agile Software Development with Scrum, Pearson, 2008.
5. Robert C. Martin, Agile Software Development Principles, Patterns and Practices, Prentice Hall
6. Lisa Crispin, Janet Gregory, Agile Testing: A Practical Guide for Testers and Agile Teams, Addison Wesley.

Reference Books:

3. Alistair Cockburn, Agile Software Development: The Cooperative Game, Addition Wesley, 2006
4. Mike Cohn, User Stories Applied for Agile Software, Addison Wesley, 2004

CS-14.351 **DAA Laboratory** **Credit: 0-0-4-2**

Prerequisite(s): CS14.111(Programming Language Laboratory)

Objective(s):

- To analyze the asymptotic performance/Time complexity of algorithms.
- To demonstrate familiarity with major algorithms and data structures.
- To apply important algorithmic design paradigms, techniques and methods for the solution of real life problems.
- To synthesize efficient algorithms in common engineering design situations.

Contents: Lab manual based upon the theory course CS 14.301 and to achieve the listed course objectives and outcomes.

Outcome(s): On successful completion of this course, the students will be able to

- Evaluate and compare different algorithms using worst-, average-, and best-case analysis.
- Describe the divide-and-conquer paradigm and explain when an algorithmic design situation calls for it. Recite algorithms that employ this paradigm. Synthesize divide-and-conquer algorithms. Derive and solve recurrences describing the performance of divide-and-conquer algorithms.
- Describe the dynamic-programming paradigm and explain when an algorithmic design situation calls for it. Recite algorithms that employ this paradigm. Synthesize dynamic-programming algorithms, and analyze them.
- Describe the greedy paradigm and explain when an algorithmic design situation calls for it. Recite algorithms that employ this paradigm. Synthesize greedy algorithms, and analyze them.
- Explain the major graph algorithms and their analysis. Employ graphs to model engineering problems, when appropriate. Synthesize new graph algorithms and algorithms that employ graph computations as key components, and analyze them.
- Explain the different ways to analyze randomized algorithms (expected running time, probability of error). Recite algorithms that employ randomization. Explain the difference between a randomized algorithm and an algorithm with probabilistic inputs.
- Understand the difference between tractable and intractable problems, and to deal with them in approximation for finding the practical solutions.

CS-14.353 **Operating System Laboratory** **Credit: 0-0-2-1**

Prerequisite(s): CS14.111(Programming Language Lab.) CS 14.223(Data Structures Lab)

Objective(s):

- Learn basic operating system abstractions like process, file, page etc. through hands on programming.
- Comprehend problems of resource sharing in operating system and develop software solutions for the same.
- Work in groups to come out with solutions that require collective application of skills learnt.

Lab manual based upon the theory course CS 14.303 and to achieve the listed course objectives and outcomes.

Outcome(s): On successful completion of this course, the students will be able to

- Simulate different operating system scenarios like, process scheduling, memory management, disk scheduling, page replacement and deadlocks.
- Comprehend real life issues in operating system design and would design software level solutions for the same.
- Work in a group to come out with piecemeal solutions individually for a large problem in operating system and would be able enough to make handshaking between different modules to develop a single solution for the same.

CS 14.359 **Microprocessor and Assembly Language Programming Laboratory** **Credit: 0-0-2 -1**

Prerequisite(s): CS 14.227 (Computer Information Systems Laboratory)

Objective(s):

- To implement programs in assembly language
- To debug assembly language programs

Content: Lab manual based upon the theory course CS 14.309 and to achieve the listed course objectives and outcomes.

Outcome(s): On successful completion of this course, students will be able to:

- Solve basic arithmetic operations using the assembly language
- Write program to find smallest/largest number
- Use stack for solving various problems
- Use program counter, status register and show how these are used to execute machine code programs

CS-14.371 **Colloquium** **Credit: 0-0-0-1**

Prerequisite(s): NIL

Objective(s):

- To observe and analyze some popular technology and gain insights
- To comprehend the acquired knowledge.
- To present the acquired knowledge to larger audience.

Content: Students have to comprehend and present on some popular technology in the field of computing.

Outcome(s): On successful completion of this course, the students will be able to

- Communicate effectively to arrange of audience.
- Recognize the need for continuous learning.
- Recognize the social impact of engineering solutions.

CS-14.332 **Software Engineering** **Total Lectures:40**

Credit:3-0-0-3

Prerequisite(s): CS-14.101 (Programming Language), CS-14.203 (Data Structures)

Objective(s):

- To understand the basic software engineering approaches, software development process models, project planning, software size estimation, software effort and cost estimation and risk management.
- To know about software requirements specification, requirement elicitation, structured system analysis and introduction of object-oriented analysis and design, design techniques.
- To acquire knowledge on implementation issues such as modularity and coding standards.
- To learn coding style guidelines and standard and software testing, different type of testing strategies and their application in real time system.
- To study web based-system and application, software re-use, software re-engineering, agile software engineering, software engineering and testing tools.
- To develop teamwork and have project based experience.

6. **Introduction:** Programs versus software products, software crisis, need for software engineering, attributes of effective software, software myths, software characteristics, and role of management in software development, overview of quality standards like ISO 9001, SEI-CMM. [6]

7. **Software Processes and Requirement Analysis:** Software engineering: a layered technology, the software process, software process models, component based development, problem analysis, requirement engineering, requirement elicitation, requirement analysis, software requirement and specifications, data flow diagrams, data dictionaries, entity-relationship diagrams. [8]

8. **Software Project Planning:** Responsibilities & skills of a project manager, project planning, and project size estimation: LOC, function point & feature point metric, project estimation techniques, COCOMO model, staffing level estimation, scheduling, risk management, software configuration management. [9]

9. **Software Design:** The design process, design principles, design concepts, effective modular design: cohesion & coupling, classification of cohesiveness & coupling, design notations, design techniques, structure charts, introduction to object-oriented design. [8]

10. **Coding and Testing:** Software testing fundamentals, test case design, white box testing:-basis path testing, control structure testing, black box testing: boundary value analysis, equivalence class testing, decision table testing, cause effect graphing, level of testing, debugging, testing tools &standards, testing for client/server architecture, real time systems and GUIs testing. Brief of software re-use, reverse engineering, software re-engineering, agile software engineering. [9]

Outcome(s):

On successful completion of this course, students will be able to

- Demonstrate knowledge of the distinction between critical and non-critical systems and ability to manage a project including planning, scheduling and risk assessment/management.
- Author a software requirements document and understanding of the proper contents of a software requirements document.
- Demonstrate proficiency of different life cycle models.
- Identify specific components of a software design that can be targeted for reuse.
- Demonstrate proficiency in software development cost estimation, software testing plan and advanced topics of software engineering.

Text Books:

3. R. S. Pressman, Software Engineering – A practitioner's approach,Tata-McGraw- Hill Int. Ed., 8th edition, 2014.
4. K. K. Aggarwal, Yogesh Singh, Software Engineering, New Age International, 1st edition, 2008.

Reference Books:

4. Pankaj Jalote, An Integrated Approach to Software Engineering, Narosa Publisher, 3rdedition, 2005.
5. Rajib Mall, Fundamentals of Software Engineering, Prentice-Hall, 2ndedition, 2004.
6. Robert C. Martin, Agile Software Development, Principles, Patterns and Practices, 1st edition, 2002.

CS-14.336 **Computer Networks** **Total Lectures: 40**
Credit: 3-0-0-3

Prerequisite(s): CS-14.203 (Data Structures), CS-14.207 (Computer Information Systems)

Objective(s):

- To become familiar with layered communication architectures (OSI and TCP/IP).
- To understand the client/server model and key application layer protocols.
- To construct large-scale computer networks
- To understand fundamentals of computer networks and major protocols.
- To analysis and evaluate major Internet protocols.
- To program simple network applications using socket API
- To learn and adopt newly introduced computer network technologies by themselves.

9. **Introduction to Network Model:** History and development of computer networks, networks topologies, MANET, categories of networks, layering and protocols. [5]
10. **Physical Layer:** Different types of transmission media, transmission impairments, encoding schemes (NRZ, NRZI, Manchester, 4B/5B, Manchester etc.), packet and circuit switching. [5]
11. **MAC Layer:** Aloha, CSMA/CA, CSMA/CD protocols, performance evaluation and characteristics. [3]
12. **Data Link Layer:** Framing concept, error detection (parity, CRC), sliding window, stop and wait protocols, stop performance and efficiency. [5]
13. **Local Area Network:** IEEE 802.3, 802.4, 802.5, 802.11, performance evaluation. [5]
14. **Network Layer:** IPv4, IP address classes, classless addressing, IPv6, ARP, RARP, DHCP, ICMP, routing algorithms: distance vector, metrics, RIP, OSPF, BGP, congestion control algorithms, leaky bucket, token bucket. [8]
15. **Transport Layer:** Duties of the transport layer, connection, TCP, TCP services, TCP header, UDP, evaluating protocol such as TCP/UDP using simulator like NS2. [5]
16. **Application Layer:** DNS, FTP, HTTP, SMTP, POP, basics of network security (cryptography, digital signature and firewall). [4]

Outcome(s): On successful completion of this course, students will be able to

- Analyze computer network component and devices.
- Synthesize how communication works in a network and internet.
- Formulate the concept of topologies and their applications.
- Analyze protocol at different layers and how they play important role in network implementation.
- Identify and analyze the latest technology with existing one.
- Enumerate the layers of OSI and TCP/IP models.
- Configure network and wireless technology including client/server programming.

CS-14.316 **Computer Graphics** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS-14.101 (Programming Languages), MA-14.101 Mathematics I

Objective(s):

- To introduce the students with the graphics mode, with the help of basic algorithms and methodologies.
- The objective of the course is to equip students with fundamental knowledge and basic technical competence in the field of computer graphics.
- Provide an understanding of how a computer draws the fundamental graphics primitives.
- To learn Computer Graphics methodologies/Algorithms and techniques and their implementations.

1. **Introduction to Computer Graphics and graphics primitives**: Overview of interactive graphics model, applications of computer graphics, graphics devices, random and raster scan systems, color models: RGB, YIQ, scan conversion: point, line, circle and ellipse. [7]
2. **2D Transformation and Viewing**: Basic transformations (translation, rotation, scaling), homogeneous coordinates, composite transformations, reflection and shearing, filling: scan line filling, flood filling, boundary filling, clipping: point clipping, line clipping, polygon clipping, and character generation. [7]
3. **Curves and Surfaces**: Introduction to curves, conic curves, polygon surfaces, tables, quadric surfaces, spline representation, cubic spline interpolation methods, Bezier curves and surfaces, B-spline curves and surfaces, fractals and its applications. [7]
4. **3D Transformation and Viewing**: 3D transformation, composite transformation, viewing pipeline, parallel and perspective projection, visible surface detection: classification of visible surface detection algorithms, back face detection, depth buffer method, A-buffer method, scan-line method, depth sorting method. [7]
5. **Illumination Model and Surface Rendering Techniques**: Basic illumination models, Halftone patterns and dithering techniques, polygon rendering methods, ray tracing methods. [6]
6. **Introduction to Animation and Multimedia:** Introduction to animation, key-frame animation, construction of an animation sequence, animation techniques, multimedia: introduction, features of multimedia system, components of multimedia systems and application of multimedia systems. [6]

Outcome(s): On successful completion of this course, students will be able to

- Understand basic concepts of computer graphics.
- Acquire knowledge about drawing basic shapes such as lines, circle ellipse, polygon.
- Perform processing of basic shapes by various processing algorithms /techniques.
- Implement two and three dimensional transformations.
- Apply various algorithms of clipping.
- Acquire knowledge about illumination models, color models and surface rendering.

Text Books:

3. Donald D. Hearn & M. Pauline Baker, Computer Graphics-C Version, Pearson Education, 2nd edition, 2002.
4. James D. Foley, Andries van Dam, Steven K Feiner, John F. Hughes, Computer Graphics Principles and Practice, 2nd Edition in C, Addison Wesley, 1995.

Reference Books:

3. Donald Hearn and M Pauline Baker, Computer Graphics with OpenGL, Pearson Education, 4th edition, 2010.
4. David F. Rogers, Procedural Elements for Computer Graphics, Tata McGraw Hill Publications, 2nd edition, 2001.

CS-14.318 **Artificial Intelligence** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS-14.101 (Programming Language), CS-14.207(Computer Information Systems)

Objective(s):
- To understand the basic problem solving in Artificial Intelligence.
- To learn different blind as well as heuristic search strategies.
- To understand the various ways of knowledge representation in Artificial Intelligence.
- To know the concepts of game theory and natural language processing.

7. **Overview of Artificial Intelligence:** Introduction to artificial intelligence and intelligent agents, brief history of artificial intelligence, related research fields, AI techniques, AI problems, applications of AI, future of AI, basic concepts of LISP and PROLOG. [6]
8. **Problem Solving and Search Techniques:** Basics of problem solving, Problem representation paradigms, defining problem as a state space representation, uninformed search, depth first search, breadth first search, heuristic search, heuristic functions, generate and test, hill climbing, best first search, A* algorithm, problem reduction, AND/OR graph, AO* algorithm. [10]
9. **Knowledge Representation and Logic:** Representation and mappings, procedural versus declarative knowledge, approaches and issues in knowledge representation, introduction to logic-based problem solving, Boolean logic, first order logic, higher order logic, unification and resolution for performing logical inference, fuzzy logic, probabilistic logic. [8]
10. **Game Theory:** Minimax search, alpha-beta cutoffs, iterative deepening, references on specific games. [5]
11. **Natural Language Processing:** Introduction to NLP, syntactic processing, semantic analysis, discourse and pragmatic processing. [5]
12. **Learning:** Learning from observation, rote learning, inductive learning, explanation basedlearning, statistical learning methods, supervised and unsupervised learning, basics of neural network, reinforcement learning discovery, analogy. [6]

Outcome(s): On successful completion of this course, students will be able to
- Solve the basic problems and apply searching techniques used in Artificial Intelligence.
- To select knowledge representations to solve AI problems.
- Apply various game playing algorithms.
- Work with natural language processing and apply learning techniques.

Text Books:
3. Rich E., and Knight K., Artificial Intelligence, Tata McGraw-Hill, 3rd edition, 2009.
4. Russell S., and Norvig P., Artificial Intelligence – A Modern Approach, Prentice-Hall of India, 3rd edition, 2014.

Reference Books:
8. Patterson D. W., Introduction to Artificial Intelligence and Expert Systems, Prentice-Hall of India, 1st edition, 2015.
9. George F. Luger, Artificial Intelligence: Structures and Strategies for Complex Problem Solving, Pearson Education, 5th edition, 2009.

CS-14.320 **Cryptography** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS-14.201 (Discrete Structures), CS-14.207 (Computer Information Systems)

Objective(s):

- To understand the classical encryption and decryption algorithms, their techniques as well cryptanalysis.
- To acquire basic knowledge of finite fields and number theory.
- To understand the various block ciphers, stream cipher models, principles of public key cryptosystems, hash functions and digital signatures.
- To understand the different authentication techniques.

7. **General Overview and Classical Cryptography:** General overview of threats, risks and consequences, sources of threats, attacks, classification and preventive measures, introduction to some simple ciphers such as shift cipher, substitution cipher, affine cipher, Vigener cipher, hill cipher, permutation cipher and stream ciphers, rigorous cryptanalysis of all the above ciphers. [8]
8. **Symmetric/Secret Key Cryptography:** Block ciphers and their principles- boxes, P-boxes, DES, 3 DES, AES. [6]
9. **Elementary Number Theory:** Euclid's algorithm, extended Euclid's algorithm, groups, solving modular linear equations, Chinese remainder theorem, modular exponentiation, discrete logarithm problem, prime numbers and primality testing, factorization problem, Fermat's and Euler's theorem, computation of generators of primes. [8]
10. **Key Exchange/Distribution Schemes:** Diffie - Hellman key exchange, man- in- the-middle attack,Fiat-Naor key distribution, Needham – Schroeder scheme and attack possible on it, Kerberos. [6]
11. **Asymmetric Key/Public Key Cryptosystems:** RSA description, different attacks on RSA and remedies, other public keycryptosystems such as ElGamal and Rabin cryptosystems and possible attacks on them. [6]
12. **Digital Signature Schemes:**Security requirements for digital signatures, ElGamal digital signature scheme and its security analysis, the digital signature algorithm (DSA), Schnorr digital signature scheme, provably secure signature schemes and undeniable signatures. [6]

Outcome(s): On successful completion of this course, students will be able to :

- Analyze the security threats.
- Design robust cryptographic algorithms.

Text Books:

2. Douglas R. Stinson, Cryptography: Theory and Practice, (Discrete Mathematics and Its Applications) Chapman and Hall/CRC, 3rd edition, 2005.

Reference Books:

4. Jonathan Katz , Yehuda Lindell, Introduction to Modern Cryptography, (Cryptography and Network Security Series), Chapman and Hall/CRC; 2nd edition, 2014.
5. William Stallings, Cryptography and Network Security: Principles and Practice, Pearson Education, 6th edition 2013.
6. Wenbo Mao, Modern Cryptography Theory & Practice, 1st edition, 2004.

CS-14.322 **Data Mining** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS-14.204 (Database Management System), CS-14.301(Design and Analysis of Algorithms), MA-14.202 (Statistics and Probability Theory).

Objective(s):

- Understand the functionality of the various data mining and data warehousing components.
- Appreciate the strengths and limitations of various data mining and data warehousing models.
- Compare the various approaches to data warehousing and data mining implementations
- Describe and utilize a range of techniques for designing data warehousing and data mining systems for real-world applications.

8. **Overview:**Evolution of the database system technology, concept of data mining and warehousing, data warehouse roles and structures, cost of warehousing data, approaches to data exploration and data mining, foundations of data mining, web warehousing, introduction to knowledge management and knowledge bases. [5]
9. **Data Warehouse:**Overview of data warehousing, data marts, data warehouse architecture, multidimensional data model, online analytical processing (OLAP), OLAP operations, data about data - metadata. [4]
10. **Data Mining and Data Visualization:** Data mining general approach, classification and clustering, introduction to DM tool (Weka,Rapidminer), techniques used to mine the data, current limitations and challenges to DM, data visualization, visualization tools. [6]
11. **Data Preprocessing:** Overview, data cleaning, data integration, data reduction strategies, principal component analysis, sampling, histograms, clustering, data cube aggregation, data transformation and discretization. [6]
12. **Machine Learning:**Supervised and unsupervised machine learning, market basket analysis (Apriori algorithm), fuzzy logic and linguistic ambiguity, artificial neural networks, genetic algorithms,genetically evolved networks, applications for machine learning. [7]
13. **Text Mining:**Information retrieval and search, text classification, text clustering, unsupervised learning, mining frequent patterns and correlations, classification concepts, backpropagation, decision tree induction, rule based classification, clustering basic concepts and methods, K-means centroid based technique. [6]
14. **Web Based Statistical Analysis:** Delivering information over the web, query and reporting tools and business value, business value from analytical tools, statistical analysis applications, data discovery tools overview, data discovery applications, search engines and the web, search engine architecture, future of data mining. [6]

Outcome(s): On successful completion of this course, students will be able to

- Identify, formulate, and solve data science related problems by applying principles of the course.
- Understand both analysis and synthesis in the design process with the help of data mining and data warehousing tools.
- Develop and conduct appropriate experiments, analyze and interpret data, and use data visualization to draw conclusions.
- Function effectively on teams that establish goals, plan tasks,meet deadlines, and analyze risk and uncertainty.

Text Books:

4. George M Marakas, Modern Data Warehousing, Mining and Visualization, Pearson Education, 1st edition, 2002.
5. **Ian H. Witten and Eibe Frank, Data Mining: Practical Machine Learning Tools and Techniques, Morgan Kaufmann, 3rd edition, 2011.**
6. Mattison R., Web Warehousing and Knowledge Management, Tata McGraw-Hill, 1st edition, 1999.

Reference Books:

4. W.H. Inmon, BuildingtheData Warehouse, Wiley Publishing Inc., 3rdedition, 2005.
5. Anahory and Murray, Data Warehousing in the Real World, Pearson Education/Addison

Wesley, 1st edition, 1997.

6. Prabhu C.S.R., Data Warehousing, Prentice-Hall of India, 2nd edition, 2002.

CS-14.324 **Data Compression** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): MA-14.202 (Statistics and Probability Theory)

Objective(s):

- To develop theoretical foundations of data compression.
- To know the concepts and algorithms for lossy and lossless data compression.
- To understand signal modeling and its extension to compression with applications to speech, image and video processing.

5. **Introduction:** Compression techniques, measures of performance, modeling and coding, information theory, Shannon coding theory, physical models, probability models, Markov models, composite source model, fixed and variable length codes, uniquely decodable codes, prefix codes, Kraft's theorem. [10]

6. **Lossless Compression:** The Huffman coding algorithm: minimum variance Huffman codes, adaptive Huffman coding, Golomb codes, rice codes, Tunstall codes, coding a sequence, generating a binary code, comparison of binary and Huffman coding, diagram coding, dictionary based compression techniques, adaptive dictionary, LZ77, LZ78 and LZW approach, predictive coding, prediction with partial match, the Burrows-Wheeler transform, facsimile encoding, dynamic Markov compression. [10]

7. **Lossy Compression:** Distortion criteria, distortion measurement models, scalar quantization, uniform quantizer, adaptive quantization, non-uniform quantization, advantages of vector quantization over scalar quantization, the Linde-Buzo-Gray algorithm, tree structured vector quantizers, structured vector quantizers. [10]

8. **Multimedia Compression:** M-law and A-law commanding, DPCM and ADPCM audio compression, MPEG audio standard, frequency domain coding, lossless techniques of image compression, gray codes, transform coding, GIF**,** JPEG, predictive techniques, PCM and DPCM, video compression and MPEG industry standard, wavelet based compression. [10]

Outcome(s): On successful completion of this course, students will be able to

- Understand the concepts, applications and models of data compression.
- Apply the methods of lossy and lossless data compression.
- Apply the methods and standards of image, audio and video data compression.

Text Books:

2. **Khalid Sayood, Introduction to data compression, Morgan Kaufmann Publishers, 4th edition, 2012.**

Reference Books:

3. Mark Nelson and Jean-Loup Gailly: The Data Compression Book, M&T Books, 2nd edition, 1996.
4. David Salomon, Data Compression: The Complete Reference, Springer, 4th edition, 2006.

ET 471 **Cloud Computing (Infosys)** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s):
Objective(s):

1. **Overview of Cloud Computing:** Brief history and evolution - History of Cloud Computing, Evolution of Cloud Computing, Traditional vs. Cloud Computing. Why Cloud Computing, Cloud service models (IaaS, PaaS & SaaS). Cloud deployment models (Public, Private, Hybrid and Community Cloud), Benefits and Challenges of Cloud Computing. Introduction to AWS Public Cloud Vendor. Cost optimization in AWS. [10]

2. **Virtualization**: Basics of virtualization, Virtualization technologies, Server virtualization, VM migration techniques, Role of virtualization in Cloud Computing. Introduction to EC2 service of AWS. [8]

3. **Working with Private Cloud:** Private Cloud Definition, Characteristics of Private Cloud, Private Cloud deployment models, Private Cloud Vendors - CloudStack, OpenStack, Eucalyptus Microsoft, Private Cloud – Benefits and Challenges. Private Cloud implementation in Amazon EC2 service. [8]

4. **Working with Public Clouds:** What is Public Cloud, Why Public Cloud, When to opt for Public Cloud, Public Cloud Service Models, and Public Cloud Players. Infrastructure as a Service Offerings, IaaS Vendors, PaaS offerings, PaaS vendors, Software as a Service. Demonstrating public cloud with AWS – Storage and Database services. Private vs. Public Cloud – When to choose. [12]

5. **Overview of Cloud Security:** Explain the security concerns in Traditional IT, Introduce challenges in Cloud Computing in terms of Application Security, Server Security, and Network Security. Security reference model, Abuse and Nefarious Use of Cloud Computing, Insecure Interfaces and APIs, Malicious Insiders, Shared Technology Issues, Data Loss or Leakage, Account or Service Hijacking, Unknown Risk Profile, Shared security model between vendor and customer in IAAS/PAAS/SAAS, Implementingsecurity in AWS. [8]

6. **Future directions in Cloud Computing:** When and not to migrate to Cloud, Migration paths for cloud, Selection criteria for cloud deployment, Issues/risks in cloud computing, Future technology trends in Cloud Computing. [4]

Text Books:

1. Cloud Computing: Principles and paradigms By Raj Kumar Buyya, James Broberg, AndrezeiM.Goscinski, 2011
2. Cloud Computing, By Michael Miller, 2008.
3. Cloud Computing for dummies, By Judith Hurwitz, Robin Bllor, Marcia Kaufman, Fern Halper, 2009.
4. Cloud Computing: A Practical Approach, By Anthony T. Velte, Toby J. Velte, and Robert Elsenpeter, McGraw Hill, 2010.
5. Handbook of Cloud Computing, By BorkoFurht, Armando Escalante (Editors), Springer, 2010.

Reference Books:

1. Cloud computing: Implementation, management and security By Rittinghouse, John, W.
2. Cloud Computing Bible, By Barrie Sosinsky, Wiley, 2011.
3. Cloud Computing Architected: Solution Design Handbook by Rhoton, John.
4. Cloud Security, A comprehensive Guide to Secure Cloud Computing by Krutz, Ronald L.; Vines, Russell Dean

CS-14.352 **Software Engineering Laboratory** **Credit:0-0-2-1**

Prerequisite(s): CS-14.111 (Programming Language Lab),CS-14.223 (Data Structures Lab.) CS-14.351(DAA Lab), CS-14.224(Database Management Systems Lab.)

Objective(s):

- studying various phases of software development life cycle.
- Problem definition of any system (e.g. ATM system,health care, airlines, banking, insurance, retail, education or latest systems).
- Feasibility study of the system.
- Identifying the requirements from problem statements(IEEE Std:830-1993)
- Requirements, categorization of requirements, functional requirements, identifying functional requirements, non functional requirements.
- data flow diagram, graphical notations for data flow diagram, explanation of symbols used in DFD,context diagram and leveling DFD.
- Entity Relationship Model,entity set and relationship set , attributes of entity ,keys ,ER diagram ,graphical notations for ER ,estimation of projects, project metrics.
- Project estimation techniques ,COCOMO , Calculate effort using FP oriented estimation model , LOC based estimation for size oriented metrics
- Designing test suites, unit testing, integration testing, system testing, black box testing, and white box testing.
- Use some of the tools that are used in the different software development stages.

Contents:

Lab manual based upon the theory course CS 14.302 and to achieve the listed course objectives and outcomes.

Outcome(s): **On successful completion of this lab, students will be able to**

- Plan a software engineering process life cycle (SDLC Models) , including the specification, design, implementation, and testing of software systems that meet specification, performance,

maintenance and quality requirements

- Elicit, analyze and specify software requirements through a productive working relationship with various stakeholders of the project.
- Analyze and translate a specification into a design, and then realize that design practically, using an appropriate software engineering methodology and students are also able to calculate the approximate cost, time estimation of the project or system.
- Develop the code from the design and effectively apply relevant standards and perform testing, and quality management and practice, and students are also able to remove some errors, bugs, of the project or system.
- Use modern engineering tools necessary for software project management, time management.
- Apply software engineering principle for developing real life web and mobile applications.

CS-14.354 **Compiler Design Laboratory** **Credit: 0-0-2-1**

Prerequisite(s): CS 14.111(Programming Language Lab.) CS 14.223(Data Structures Lab.)

Objective(s):

- To design and implement a lexical analyzer
- To design and implement a parser
- To design and implement symbol tables
- To understand and design code generation schemes
- To learn the working of some compiler writing tools

Contents:

Lab manual based upon the theory course CS 14.304 and to achieve the listed course objectives and outcomes.

Outcome(s): On successful completion of this course, the students will be able to

- understand the peculiarities of a language translator
- get the practical approach of how a compiler works
- work in the development phase of new computer languages in industry
- understand the working of compiler construction tools
- visualize and design a new compiler of her own language

CS-14.356 **Computer Network Laboratory** **Credit: 0-0-2-1**

Prerequisite(s): CS14.111 (Programming Language Lab.), CS 14.223(Data Structures Lab.)

Objective(s):

- To implementing the client/server model with its application aspects.
- Sniffing packets in network as a network analyzer
- To implement protocols at various types communicating protocols
- To implement socket programming application with inbuilt API
- To code error correction and detection technique like CRC, checksum and parity

Contents: Lab manual based upon the theory course CS 14.306 and to achieve the listed course objectives and outcomes

Outcome(s): On successful completion of this course, students will be able

- To know how communication works at different layers of TCP/IP model
- To understand practically the purpose of various key protocol.
- To learn how a network can be efficiently deployed.
- To identify and analyze the latest technology with existing one.
- To configure network with client/server programming
- To understand computer network component and devices.

CS-14.374 **Comprehensive-II** **Credit: 0-0-0-4**

Prerequisite(s): CS-14.220 (Comprehensive-I), CS-14.301 (Design and Analysis of Algorithms), CS-14.303 (Operating System), CS-14.305 (Logic in Computer Science), CS-14.309 (Microprocessor and Assembly Language Programming), CS-14.332 (Software Engineering), CS-14.334 (Compiler Design), CS-14.336 (Computer Networks)

Objective(s):

- To examine the understanding of the student in different fields of computer science in concise manner.

8. **Design and Analysis of Algorithms:** Sorting, divide and conquer, graph theory, greedy algorithms, dynamic programming, backtracking, NP complete.
9. **Operating System:** Batch processing, multiprogramming, multiprocessing, and multitasking, process management, CPU scheduling, I/O scheduling, resource scheduling, deadlock and scheduling algorithms. Banker's algorithm for deadlock handling, memory management: virtual memory, paging, segmentation, concurrent processing: mutual exclusion, critical regions lock and unlock, scheduling.
10. **Logic in Computer Science:** Propositional (Boolean) logic, predicate logic, well–formed–formulae (WFF), satisfiability and tautology.
11. **Microprocessor:** Introduction to microprocessor, microprocessor instruction set, architecture of microprocessor, register set, mapping of memory and I/O devices, addressing modes, counters and time delays.
12. **Software Engineering**: Information gathering, requirement and feasibility analysis, data flow diagrams, process specifications, input/output design, process life cycle, planning and managing the project, design, coding, testing, implementation, maintenance.
13. **Compiler Design:** Context free languages and push-down automata, recursively enumerable sets and Turing machines, undecidability, lexical analysis, syntax and semantic analysis, intermediate code generation, code generation and optimization.
14. **Computer Networks:**ISO/OSI stack, LAN technologies (Ethernet, token ring), flow and error control techniques, routing algorithms, congestion control, TCP/UDP and sockets, IPv4, application layer protocols (ICMP, DNS, SMTP, POP, FTP, HTTP), basic concepts of hubs, switches, gateways, and routers, network security, basic concepts of public key and private key cryptography, digital signature, firewalls.

Outcome(s):

- At the end of this course students will be able to comprehend her knowledge gained in the entire year.

RM 17.101 **Research Methodology** **2-0-0-2**

1. **Introduction:** Meaning of research, Objectives, Motivation for Research, Types of Research, Research Approaches, Research Process,Validity and Reliabilityin Research. [2]

2.**ProblemFormulation:**Identification,Selection andFormulation ofa ResearchProblem, Criteria ofagood Research Problem, Reviewof Literature, Research Gaps. [4]

3.**Research Design:**ResearchFramework, Meaning &Significance of ResearchDesigns,Featuresofa good Research Design, Types of Research Design. [4]

4.**Dataforresearch:**TypesofData,Sources of Data, Methods of Collecting Data,DataPresentation Techniques. Methodsof DataAnalysis.[4]

5. **Data Analysis and Simulation Tool:** Introduction to SPSS, MATLAB, Network Simulators, ETAP, Solid Works, MultiSim. [8]

6. **ReportWriting:**Types of Reports,Contents, Style Manuals, Results & Findings, Contributions, Implications, Scope for future work and conclusion, Referencing Styles, Anti Plagiarism Policy. [4]

TextBooks:

1. R.Pannershelvam, "ResearchMethodology" PrenticeHall India, New Delhi, 2nd Edition, 2013.
2. C.R.Kothari,"ResearchMethodology: MethodsandTechniques",New Age International (p) Limited,Publishers New Delhi, 4ndedition,2018.

CS 14.401 **Soft Computing** **Total Lectures: 40**
Credit: 3-0-0-3

Prerequisite(s): CS 14.305(Logic in Computer Science)

Objective(s):
- To familiarize with soft computing concepts
- To introduce the idea of neural networks, fuzzy logic and use of heuristics based on human experience
- To introduce the concept of genetic algorithm and its applications to soft computing using some applications

13. **Introduction**: Introduction of soft computing, types of soft computing, applications of soft computing, introduction of artificial intelligence, production system, various search techniques, hill climbing, best first search, knowledge representation, monotonic and non-monotonic reasoning. [8]
14. **Neural Networks:**Structure and function of a single neuron, definition of ANN, characteristics of ANN, applications of ANN, single layer networks, perceptron training algorithm, linear separability, various learning rules, delta rule, ADALINE, MEDALINE, multi-layer networks, activation functions, error back propagation algorithms, characteristics of EBPA. [8]
15. **Neral Network Architectures**: Counter propagation networks, architecture, functioning, characteristics, Hopfield network, configuration, associative memory, limitations and applications, Hopfield vs Boltzman machine, adaptive resonance theory, architecture, classification, implementation and training [8]
16. **Fuzzy Logic :**Fuzzy logic, fuzzy set theory, fuzzy set vs crisp set, crisp relation and fuzzy relation, introduction and features of membership functions, fuzzy rule based system, fuzzy propositions, formation, decomposition and aggregation of fuzzy rules, fuzzy reasoning, fuzzy interference system, fuzzy decision making, applications of fuzzy logic. [8]
17. **Genetic Algorithms :**Genetic algorithm, fundamentals, basic concepts, working principle, encoding, fitness function, reproduction, genetic modelling, inheritance operator, cross over, inversion and deletion, mutation operator, bitwise operator, generational cycle, convergence of GA, applications and advances in GA, difference and similarities between GA and other traditional methods. [8]

Outcome(s): On successful completion the students will be able to:
- Identify and describe soft computing techniques and their roles in building intelligent machines
- Apply fuzzy logic and reasoning to handle uncertainty and solve engineering problems
- Apply genetic algorithms to combinatorial optimization problems
- Apply neural networks to pattern classification and regression problems
- Evaluate and compare solutions by various soft computing approaches for a given problem

5. Timothy J.Ross, "Fuzzy Logic with Engineering Applications", McGraw-Hill, 3rdEdition, 2009.
6. Davis E. Goldberg, "Genetic Algorithms: Search, Optimization and Machine Learning", Pearson Education , 2006

CS 14.403 **Parallel Computing** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): CS 14.208 (Computer Organization and Architecture)

Objective(s):

- To provide students with contemporary knowledge in parallel computing.
- To equip students with skills to design and analyze parallel applications.
- Describe the various design issues in a parallel computing System e.g. system performance and reliability, distributed file system etc.
- Describe and program the communication among processes at different hosts to facilitate parallel computing.

1. **Introduction**: scope and issues of parallel and distributed computing, taxonomy of parallel structures, control mechanism, address-space organization, interconnection connection networks: static and dynamic interconnection networks, evaluating static interconnection networks, embedding other networks (linear array, mesh, binary tree) into a hypercube, routing mechanisms for static interconnection networks: store and forward (SF) routing, cut - theory (CT) routing, cost-performance trade-off, architectural models for parallel algorithm design. [8]
2. **Basic Communication Operation**: Simple message transfer between two processors, one-to-all broadcast, all-to-all broadcast, reduction and prefix sums, one-to-all personalized communication, all-to-all personalized communication, circular shift. [7]
3. **Performance and Scalability of Parallel Systems**: Performance matrices for parallel systems: run time, speed up, efficiency and cost, the effect of granularity and data mapping on performance, scalability of parallel systems, ISO-efficiency metric of scalability. [7]
4. **Models of Distributed Computing**: Mini computer model, workstation pool model, client-server model, pool of processors model, hybrid model. [6]
5. **Inter Process Communication and Remote Procedure Calling**: Building blocks, client-server communication,group communication, case study: inter processor communication in Unix, design issues in remote procedure calling, implementation. [6]
6. **Parallel Computing Algorithms**: Various sorting and searching algorithms, performance metrics for parallel algorithm implementations. [6]

Outcome(s): At the end of this course, student will be able to accomplish following.

- Define terminology commonly used in parallel computing, such as efficiency and speedup.
- Describe different parallel architectures, inter-connect networks, programming models, and algorithms for common operations such as matrix-vector multiplication.
- Given a problem, develop an efficient parallel algorithm to solve it.
- Given a parallel algorithm, analyze its time complexity as a function of the problem size and number of processors.
- Given a parallel algorithm, an input to it, and the number of processors, show the steps performed by that algorithm on that input.

8. T G Lewis and H El Rewini, "Introduction to Parallel Computing", Prentice-Hall 1992.

CS-14.405 **Digital Image Processing** **Total Lectures: 40**
Credit: 3-0-0-3

Prerequisite(s): CS-14.101 (Programming Language), MA-14.201(Applied Mathematics)

Objective(s):

- To study the image fundamentals and mathematical transforms necessary for image processing.
- To study the image enhancement techniques
- To study image restoration procedures.
- To study the image compression procedures.
- To study the image segmentation and representation techniques
- To study the image representation in form of features and descriptors

7. **Digital Image Fundamentals:** Elements of digital image processing systems, elements of visual perception, brightness, contrast, hue, saturation, mach band effect, color image fundamentals - RGB, HSI models, image sampling, quantization, dither, two-dimensional mathematical preliminaries, 2D transforms - DFT, DCT, KLT, SVD. [7]
8. **Image Enhancement and Restoration:** Histogram equalization and specification techniques, noise distributions, spatial averaging, directional smoothing, median, geometric mean, harmonic mean, contra harmonic mean filters, image restoration - degradation model, unconstrained restoration, inverse filtering, removal of blur caused by uniform linear motion. [7]
9. **Morphological Image Processing:** Basics, structuring element, erosion, dilation, opening, closing, hit-or-miss transform, boundary detection, hole filling, connected components, convex hull, thinning, thickening, skeletons, pruning, and reconstruction by dilation and erosion. [7]
10. **Image Segmentation:** Edge detection, edge linking via Hough transform, thresholding, region based segmentation, region growing, region splitting and merging, and segmentation by morphological watersheds, basic concepts, dam construction, and watershed segmentation algorithm. [7]
11. **Image Representation:** Boundary representation, chain code, polygonal approximation, signature, boundary segments, boundary description, shape number, Fourier descriptor, regional descriptors, and topological features. [6]
12. **Image Compression:**Need for data compression, Huffman, run length encoding, shift codes, arithmetic coding, vector quantization, transform coding, JPEG standard, MPEG. [6]

Outcome(s): On successful completion of this course, students will be able to

- Discuss digital image fundamentals.
- Apply image enhancement and restoration techniques.
- Use image compression and segmentation Techniques.
- Represent features of images.

Text Books:

10. Rafael C. Gonzales, Richard E. Woods, “Digital Image Processing”, Third Edition, Pearson Education, 2010.
11. Anil Jain K. “Fundamentals of Digital Image Processing”, PHI Learning Pvt. Ltd., 2011.
12. Bernd Jähne, Digital Image Processing, Springer Science & Business Media, 29-Jun-2013.

CS 14.411 **Advanced Computer Architecture** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 14.101 (Programming languages), CS 14.208 (Computer Organization and Architecture)

Objective(s):

- To discuss the organization of computer-based systems and how a range of choices are influenced by application.
- To understand the organization and operation of current generation computer systems including multiprocessor and multicore systems.
- To understand the principles of I/O in computer systems including viable mechanism for I/O and secondary storage organization.

6. **Introduction**: Overview of parallel processing and pipelining, study and comparison of uni-processors and parallel processors, architectural classification, applications of parallel processors, instruction level parallelism, performance matrices and measures, speedup. [6]
7. **Pipelining:**Principles and implementation of pipelining, classification of pipelining processors, pipeline architecture, general pipelining reservation table, design aspect of arithmetic and instructional pipeline, pipelining hazards and resolving techniques, advanced pipelining techniques, software pipelining, implementation issues. [8]
8. **Vector and Array Processors** : Vector and array processors, basic vector architecture, issues in vector processing, SIMD computer architecture, masking and data network mechanism, interconnection networks of SIMD, static vs dynamic networks, parallel algorithm for array processors, matrix multiplication, sorting, implementation issues. [10]
9. **Multiprocessor Architecture** : Multiprocessor architecture, loosely and tightly coupled multiprocessors, characteristics of multiprocessor, inter-processor communication network, memory contention and arbitration techniques, cache coherence, bus snooping, massively parallel processors, inter process communication and synchronization. [10]
10. **Parallel Algorithms:**Multithreading, synchronous and asynchronous message passing, shared memory, study of parallel programming concepts, parallel algorithm for multiprocessors, operating system for multiprocessors, message passing interfaces, parallel programming languages, Fortran 90, Occam, C-Linda, CCC. [6]

Outcome(s): On successful completion of this course, students will be able to

- Describe the operation of performance enhancements such as pipelines, dynamic scheduling, branch prediction, cache, and vector processors.
- Describe modern architectures such as RISC, super scalar, multiprocessor and multicore systems.
- Develop applications for high performance computing systems.

Text Books:

3. Kai Hwang, Naresh Jotwani, “Advanced Computer Architecture”, McGraw-Hill Education, 2011.
4. John L Hennessey, David A Patterson, “Computer Architecture – A Quantitative Approach”, Morgan Kaufmann, Elsevier Publishers, 5thedition, 2012.

Reference Books:

3. Kai Hwang, Zhi Wei Xu, “Scalable Parallel Computing”, McGraw Hill,1998.
4. Kai Hwang, Faye A Briggs, “Computer Architecture and Parallel Processing”, McGraw Hill, 1984.

CS 14.413 **Foundations and Applications of IoT** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 14.101 (Programming Language), CS 14.303 (Operating System), CS 14.306 (Computer Networks)

Objective(s):
- To introduce the vision and impact of IoT.
- To understand IoT Market perspective.
- To understand the challenges that must be overcome by IoT technology.

7. **M2M to IoT:** The vision-introduction, from M2M to IoT, M2M towards IoT-the global context, a use case example, differing characteristics. [5]

8. **M2M to IoT – A Market Perspective:** Introduction, some definitions, M2M value chains, IoT value chains, an emerging industrial structure for IoT, the international driven global value chain and global information monopolies, M2M toIoT-an architectural overview, building an architecture, main design principles and needed capabilities, an IoT architecture outline, standards considerations. [9]

9. **M2M and IoT Technology Fundamentals:** Devices and gateways, local and wide area networking, data management, business processes in IoT, everything as a service (XaaS), M2M and IoT analytics, knowledge management. [7]

10. **IoT Architecture- Introduction, State of the art:** Architecture reference model-introduction, reference model and architecture, IoT reference model. [6]

11. **IoT Reference Architecture:**IoT reference architecture- introduction, functional view, information view, deployment and operational view, other relevant architectural views, real-world design constraints- introduction, technical design constraints-hardware is popular again, data representation and visualization, interaction and remote control. [8]

12. **Implementation Examples:** Industrial automation, the smart grid, smart cities. [5]

Outcome(s): On successful completion of this course, students will be able to
- Understand the vision of IoT from a global context.
- Determine the Market perspective of IoT.
- Understand the use of Devices, Gateways and Data Management in IoT.
- Build architecture in IoT
- Analyze, design and develop parts of IoT solution

Text Books:

6. Francis daCosta, “Rethinking the Internet of Things: A Scalable Approach to Connecting Everything”, 1st Edition, Apress Publications, 2013

CS 14.415 **Data Science and Big Data Analytics** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 14.204 (Database Management System)

Objective(s): To understand the fundamental concept of Data Science and Big Data Analytics and its application in various fields.

5. **Data and its Classifications**: Data, information, knowledge and wisdom, digital and analog data, unstructured data,semi-structured data ,structured data, sources of data, dealing with unstructured data, data science and responsibilities of data scientist, database, data warehouse, data mining and big data. [10]
6. **Introduction to Big Data**: Big data, characteristics of big data-volume, velocity, variety,challenges with big data, applications of big data in healthcare, agriculture, education, scientific experiments, advertising, stock market etc., integrity and privacy of big data, big data and cloud computing, big data and IoT. [10]
7. **Classification of Analytics:** Descriptive, diagnostic, discovery, prescriptive and predictive analytics, big data analytics, semantic analytics, in-memory analytics, analytics and decision making, shared nothing architecture, CAP theorem, parallel and distributed system, massively parallel processing. [10]
8. **Hadoop and its Architecture**: RDBMS and Hadoop, master slave architecture, HDFS, name node, secondary name node, data node, HDFS client, replica placement strategy, MapReduce, job tracker, task tracker, map phase, reduce phase, shuffle phase, Hadoop 1.0 and Hadoop 2.0, YARN, Installation of Hadoop in pseudo distributed mode and full distributed mode. [10]

Outcome(s): On successful completion of this course, students will be able to

- Apply learning and knowledge ofData Science and Big Data Analytics to solve real life problems in various areas of social importance.

Text Books:

4. Seema Acharya, SubhashiniChellapan, “Big Data and Analytics”, Wiley,,ISBN:978-81-265-5478-2, 2015

ET 463 **Enterprise Computing – I** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS14.101 (Programming Language), CS 14.204 (Database Management System)

Objective(s):
- To define enterprise computing
- To provide an in-depth and comprehensive knowledge of the hardware and software architecture of enterprise system
- To introduce about the enterprise standards

6. **Characteristics of Enterprise Computing:** Reliability, availability, scalability, capacity, access to large amount of data, integrity and security, system management, autonomic capabilities. [5]
7. **Introduction to TSO & ISPF:** Logging in a mainframe, understanding ISPF menus, understanding datasets & record length, sequential, partitioned VSAM, creation of a PDS for programs, JCL etc. vs Loadlib, creation of a sequential DS for application data, understanding catalog, using ISPF editor. [10]
8. **JCL & SDSF Basics:** Basic JCL programming, modifying an existing compile, link and execute JCL for specific use, JOBCARD, DD statements, understanding JOB-STEP, understanding JOBLIB and STEPLIB, understanding PARM to move data from JCL to program, understanding SDSF outputs. [10]
9. **Basic Application Programming:** Understanding logical file name (used in program) and physical file name (used in JCL) and how they are mapped, writing a simple COBOL program with data stored in a VSAM file or a flat file (intent is not to teach COBOL language, the student should be able to apply the language in the environment, student will be provided with sample JCLs & VSAM file that will be used in program). [10]
10. **Introduction to SPUFI:** Understanding how to use SPUFI environment to write and execute SQL statements. [5]

Outcome(s): On successful completion of this course, students will be able to
- Describe the hardware and software architecture of an actual enterprise platform and explain the main functionality of the physical and virtual components.
- Perform basic administrative tasks in an enterprise computer system such as: the creation of new users, job monitoring and management, and back-ups and re- store operations.
- Possess basic practical knowledge regarding the process of installing, configuring and operating applications in an enterprise computer system as well as applying updates to the operating system

Text Book:

5. Alex Leon , IBM Mainframe Handbook, 1/e PB 1st Edition.
6. Alan Simon, "Network Re-engineering: Foundations of Enterprise Computing", Academic Press, 2012.
7. Mike Ebbers, John Kettner, Wayne O'Brien, Bill Ogden, IBM Redbooks, "Introduction to the New Mainframe: z/OS Basics", IBM Redbooks, 2012.

ET-362 **Mobile Apps Development** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): CS 14.202(Java Programming)

Objective(s):

- To learn how mobile apps are different from others traditional apps by learning those aspects of mobile programming that make it unique from other platforms
- Program mobile applications for the Android operating system that use basic and advanced phone features
- Deploy applications to the Android marketplace for distribution.

6. **Getting started with Mobility:** Mobility landscape, mobile platform, mobile apps development, overview of android platform, setting up the mobile app development environment along with an emulator, a case study on mobile app development. [8]

7. **Building blocks of mobile apps: Apps user:** Interface designing-mobile UI resources (Layout,UI elements, Draw-able,Menu), activity-states and life-cycle, interaction amongst activities. app-functionality beyond user interface- threads, async task, service –state and life cycle, notification, broad cast receivers, telephony and smsapis native data handling-on device file I/O, shared preferences, mobile database such as SQLite, and enterprise data access(via Internet/Intranet) [15]

8. **Sprucing up mobile apps:** Graphics and animation- custom views, canvas, animation APIs, multimedia-audio/video playback and record, location awareness, and native hardware access (sensor such as accelerometer and gyroscope). [8]

9. **Testing mobile apps:** Debugging mobile apps, whiteboxtesting,blackbox testing, and test automation of mobile app, JUnit for Android, Robotium, Monkey Talk. [6]

10. **Taking apps to market:** Versioning signing and packaging mobileapps, distributing apps on mobile market place. [3]

Outcome(s): On successful completion of this course, students will be able to

- Understand the android operating system in details
- Create mobile application for various screens
- Deploy on play store market
- Use various sensors available in mobile

Text Books:

1. Barry Burd, Android Application Development All in One for Dummies, Johen Wiley & Sons Inc., Edition I , 2011.

2. Anubhav Pradhan ,Anil V Deshpandy, Mobile App Development, Edition I

Reference Books: 1.Lauren Darcey, Shane Conder,"Teach Yourself Android Application Development in 24 Hours",Sams Publishing, 2012, 2nd Edition , 2012.

CS-14.451 **Soft Computing Laboratory** **Credit: 0-0-2-1**

Prerequisite(s): CS14.111(Programming Language Laboratory)

Objective(s):

- To implement heuristic search techniques.
- To implement neural networks for solving problems.
- To solve problems using fuzzy logic.
- To implement genetic algorithms.

Content: Lab manual based upon the theory course CS 14.401 and to achieve the listed course objectives and outcomes

Outcome(s): On successful completion of this course, the students will be able to

- Implement soft computing techniques for different problems.
- Develop soft computing models to handle non deterministic problems.
- Analyze and synthesize the performance of developed solution with relevant parameters.

CS-14.455 **Digital Image Processing Laboratory** **Credit: 0-0-2-1**

Prerequisite(s): CS14.111(Programming Language Laboratory)

Objective(s):

- To implement image transforms and analyze their performance.
- To implement image enhancement methods.
- To apply morphological operations on images.
- To implement image compression algorithms and analyze the efficiency.

Lab manual based upon the theory course CS 14.405 and to achieve the listed course objectives and outcomes

Outcome(s): On successful completion of this course, the students will be able to

- Apply basic operations on an image like read, write, binarizeetc.
- Apply image transforms and analyze their performance.
- Develop morphing algorithms as per the need.
- Extract features from image using segmentation.
- Compress a given image and analyze its performance.

CS-14.471 **Minor Project** **Credit: 0-0-0-5**

Prerequisite(s): CS14.111(Programming Language Laboratory)

Objective(s):

- To identify and formulate an engineering problem.
- To design a model or process to solve the formulated problem.
- To develop the solution by implementing the proposed design.
- To work in team to contribute to the development of project.
- To analyze and synthesize the product against critical and relevant parameters.

Content: Students will develop (preferably in a team) a project under guidance of faculty member based upon the area of interest of both student and faculty member.

Outcome(s): Preferably should cover most of the student outcomes.

CS-14.473 **Industrial Training Seminar** **Credit: 0-0-0-2**

Prerequisite(s): NIL

Objective(s):

- To observe and analyze the problem solving process/model on ground.
- To comprehend the acquired knowledge on field.
- To get some hands on practice on relevant technologies used in real life problem solving.
- To present the acquired knowledge to larger audience.

Content:

Students have to present the findings/observation while at training at some industry. They have to submit a report also clearly mentioning the outcomes of the training.

Outcome(s):

On successful completion of this course, the students will be able to

- Communicate effectively to arrange of audience.
- Recognize the need for continuous learning.
- Analyze and synthesize engineering problems and their solutions.

CS 14.402 **Distributed Systems** **Total Lectures: 40**

Credit: 3-0-0-3

Prerequisite(s): CS 14.202 (Java Programming), CS 14.303 (Operating Systems), CS 14.306 (Computer Networks)

Objective(s): To make students aware of:

- What a distributed system is, its example, use and utilities.
- Hardware and software requirements/constraints for implementation of distributed systems.
- Abstractions like, RMI, distributed objects, RPC, distributed shared memory etc.
- Notion of time in a distributed system.
- Databases in a distributed system.

9. **Characterization of Distributed Systems:** Definition, distributed systems-Internet, intranet, mobile, ubiquitous computing, resource sharing and World Wide Web challenges-heterogeneity, openness, security scalability failure handling concurrency and transparency. [3]
10. **System Models:** Architecture models- software layers, system architecture, variations on client-server model, interfaces, design requirement for distributed architectures, fundamental and interaction models, and failure and security models. [4]
11. **Distributed Object and Remote Invocation:** Introduction to remote method invocation (RMI) and interface in distributed systems, communication between distributed objects-objects model, distributed objects, distributed objects model and design issues for RMI, implementation of RMI and distributed garbage collection, remote procedures call and sun RPC case study, events and notifications participants, JINI distributed event specification, Java RMI case study, building client and server programs, design and implementation of Java RMI. [8]
12. **Time and Global State:** Clocks, events and process states, synchronizing physical clocks-synchronization in a synchronous system, Cristian method for synchronizing clocks, Berkley algorithm, network time protocol, global state and consistent cuts. [5]
13. **Distributed Shared Memory:** Introduction, message passing versus DSM, implementation approaches to DSM, design and implementation issues-structure and synchronization model. [5]
14. **Distributed Database Systems:** Distributed DBMS architecture, distributed database design, alternate design strategies, distribution design issues, fragmentation, and allocation. [5]
15. **Processes and Processors in Distributed Systems:** Threads, system models, processor allocation, scheduling, fault tolerance. [5]
16. **Distributed File System:** Design, implementation, trends in distributed file system. [5]

Outcome(s): On successful completion of the course the student will be able to:

- Understand the concept of distributed systems.
- Explain the principles underlying the functioning of distributed systems as well as how these principles are applied in distributed systems.
- Comprehend the problems and challenges of distributed systems.
- Understand and estimate the impact of different design choices, system features on distributed systems.

Text Books:

3. Colouris, “Distributed Systems Concepts and Design”, Addison Wesley, 5th edition, 2011.
4. George Coulouris, Jean Dollimore, Tim Kindberg, Gordon Blair,"Distributed Systems" , Pearson Education Limited, 2013

Reference Books:

3. Pradeep K. Sinha,"Distributed Operating Systems",PHI Learning Pvt. Limited, 2011.
4. MukeshSinghal, NiranjanShivrathri, “Advanced Concepts in Operating Systems”, TMH,

2011.

CS 14.412 **Software Project Management** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): CS 14.302 (Software Engineering)

Objective(s):

- To introduce the concepts of Software Project Management to the students.
- To make the students understand the requirement for project evaluation.
- To make the students understand the requirement for Software quality assurance and project management along with its tools.

18. **Introduction to Software Project Management (SPM) : S**oftware Engineering problem and software product, software product attributes, definition of a Software Project (SP), SP vs. other types of projects activities covered by SPM, categorizing SPs, Project Management cycle, SPM framework, types of project plan **[6]**
19. **Project Evaluation:** Strategic assessment, technical assessment, cost benefit analysis, cash flow forecasting, cost benefit evaluation techniques, risk evaluation **[5]**
20. **Activity Planning:** Objectives, project schedule, sequencing and scheduling activities, networkplanning models, forward pass, backward pass, activity float, shortening projectduration, activity on arrow networks, risk management, nature of risk, types ofrisk, managing risk, hazard identification, hazard analysis, risk planning and control **[8]**
21. **Monitoring and Control:** Introduction, creating the frame work, collecting the data, visualizing progress, cost monitoring, earned value, prioritizing monitoring, getting the project back to target, change control **[6]**
22. **Managing people and Organizing teams:**Introduction,understandingbehaviour, organizational behaviour: a background,selecting the right person for the job, instruction in the best methods, motivation, the Oldman, Hackman job characteristics model, working in groups, becominga team, decision making leadership, organizational structures, stress, health and safety, case studies **[8]**
23. **Software Quality Assurance and Testing:** Testing principles and objectives, test plan, types and levels of testing, test strategies, program verification and validation, software quality, SEI-CMM,SQA activities, QA organization structure, SQA plan **[7]**

Outcome(s):

Upon completion of the course the student should be able to:

- Examine the fundamentals of the software project and the factors involved in using a methodology in the context of project management.
- Explain the risks, issues, and critical success factors associated with technology projects and software projects in particular.
- Create a project plan, including scope definition, risk assessment, task breakdown, team selection, estimates, communication mechanisms and progress evaluation and reporting using an appropriate project lifecycle.
- Present and justify a fully documented project plan.
- Employ appropriate software for project planning, estimation, monitoring and control, communication and reporting.

Text Books:

3. Bob Hughes, Mikecotterell, “Software Project Management”, Fourth Edition, Tata McGraw Hill, 2009.

4. AshfaqueAhmed,"Software Project Management: A Process-Driven Approach",CRC Press, 2016.

Reference Books:

4. **Ramesh, Gopalaswamy, "Managing Global Projects", Tata McGraw Hill**,2nd ed. 2005.
5. Royce, “Software Project Management”, Pearson Education, 1999.
6. Walker Royce ,Software Project Management, , 1998, Addison Wesley.

CS 14.414 **Technologies of Big Data** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 14.415 (Data Science and Big Data and Analytics)

Objective(s): To understand and learn various technologies of Big Data Analytics and apply them to solve real world problems.

6. **Hadoop and MapReduce** :Functional programming , MapReduce programming, running a MapReduce programs on Hadoop, word count, distributed sort, distributed grep. [7]

7. **Hive**: Hive, HiveQL vs SQL, Hive in Hadoop ecosystem, installation of Hive, query execution in Hive, data types and file formats, create table, alter table, drop table, loading data into tables, select-from clause, where clause ,group by clause, join statements, views and indexes. [10]

8. **Pig**: Pig , PigLatin, Pig on Hadoop, installing and running Pig, Grunt, Pig data models, load, store and dump, relational operations-foreach, filter, groupby, orderby, distinct, Join, user defined functions(UDFs),developing and testing PigLatin scripts. [10]

9. **Spark** : Spark, Hadoop versus Spark, Installation of spark, spark architecture, solving business problem with Spark, Spark streaming framework and processing models. [7]

10. **NoSQL Databases** :NoSQL, database scaling, CAP theorem , ACID versus BASE, key – value stores, column oriented databases, document databases ,graph databases, NoSQL challenges. [6]

Outcome(s): On successful completion of this course, students would be able to

- Apply learning and knowledge of Big Data technologies tosolve real world problems and acquire required skills set for industry.

Text Books:

3. Chuck Lam, “Hadoop in Action”, Manning Publications,2nd ed. 2015, ISBN: 9781935182191
4. Edward Capriolo, Dean Wampler, Jason Rutherglen,“Programming Hive”, O’Reilly Media,2016,ISBN: 978-1-449-31933-5

Reference Books:

3. Alan Gates, “Programming Pig”, O’Reilly Media,2011,ISBN: 978-1-449-30264-1
4. James A. Scott, “Getting Started with Apache Spark”, MapR Technologies,2015

CS 14.416 **Designing of IoT** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 14.101 (Programming Languages), CS 14.303 (Operating System), CS 14.306 (Computer Networks)

Objective(s):
- To understand IoT architecture and IoT design constraints
- To understand the vision and impact of IoT
- Understand IoT Market perspective.

6. **Internet/Web and Networking Basics** : OSI Model, data transfer referred with OSI model, IP addressing, point to point data transfer, point to multi point data transfer & network topologies, sub-netting, network topologies referred with web, introduction to web servers, introduction to cloud computing [5]
7. **IoT Platform Overview:** Overview of IoT supported hardware platforms such as: raspberry pi, ARM cortex processors, arduino and intel galileo boards, network fundamentals: overview and working principle of wired networking equipment's – router, switches, overview and working principle of wireless networking equipment's – access points, hubs etc. linux network configuration concepts: networking configurations in linux accessing hardware & device files interactions. [7]
8. **IoT Architecture:** History of IoT, M2M – machine to machine, web of things, IoT protocols, remote monitoring & sensing, remote controlling, performance analysis, the layering concepts , IoT communication pattern, IoT protocol architecture, the 6LoWPAN, security aspects in IoT. [8]
9. **IoT Application Development**: MQTT, REST/HTTP, CoAP, MySQL, apache for handling HTTP Requests, PHP & MySQL for data processing, MongoDB object type database, HTML, CSS & jQuery for UI designing, JSON lib for data processing, security & privacy during development, application development for mobile platforms: overview of android / IOS app development tools. [13]
10. **Case Study & advanced IoT Applications:**IoT applications in home, infrastructures, buildings, security, Industries, home appliances, other IoT electronic equipments, use of big data and visualization in IoT, industry 4.0 concepts, sensors and sensor node and interfacing using any embedded target boards (Raspberry Pi / Intel Galileo/ARM Cortex/ Arduino) [7]

Outcome(s): On successful completion of this course, students will be able to:
- Explain the current status and expected future directions of the internet of things.
- Identify and propose applications which advance the IoT.
- Develop applications which advance the IoT.

Text Books:

4. Dr.OvidiuVermesan, Dr. Peter Friess, "Internet of Things: Converging Technologies for Smart Environments and Integrated Ecosystems", River Publishers,2013
5. Jean-Philippe Vasseur, Adam Dunkels, "Interconnecting Smart Objects with IP: The Next Internet", Morgan Kuffmann, 2010.
6. Zach Shelby, Carsten Bormann, "6LoWPAN: The Wireless Embedded Internet", Wiley, 2011.

Reference Books:

3. Asoke K Talukder and Roopa R Yavagal, "Mobile Computing", 4th ed. Tata McGraw Hill, 2010.
4. F. Adelstein and S.K.S. Gupta, "Fundamentals of Mobile and Pervasive Computing", McGraw Hill, 2009.

ET 474 **Enterprise Computing – II** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 463 (Enterprise Computing – I)

Objective(s):
- To define advance JCL.
- To provide an in-depth and comprehensive knowledge of the hardware and software architecture of enterprise system.
- To introduce about the enterprise standards.

4. **Advanced JCL:** Coding a JCL, using PROCS (Catalog and In-Stream), using DFSORT, ICETOOL. [8]
5. **Advanced Datasets:** Understanding record length, allocation of SPACE, fixed and variable record length, VSAM, defining VSAM, understanding CI and CA, GDG, understanding usage of GDG, defining GDG. [12]
6. **Understanding CICS:** CICS fundamentals, understanding transactions, pseudo conversational programming, understanding CICS tables, coding BMS maps, compiling of a CICS program & NEWCOPY + CEMT entry for programs, writing simple CICS program to read key data (say StudentID) from user & display details obtained from a VSAM, CICS tables for VSAM/DB2 will be provided. [20]

Outcome(s): On successful completion of this course, students will be able to
- Describe the hardware and software architecture of an actual enterprise platform and explain the main functionality of the physical and virtual components.
- Perform basic administrative tasks in an enterprise computer system such as: the creation of new users, job monitoring and management, and back-ups and re- store operations.
- Possess basic practical knowledge regarding the process of installing, configuring and operating applications in an enterprise computer system as well as applying updates to the operating system

CS 14.422 **Software Testing and Quality Assurance** **Total Lectures: 40**
Credit: 3-1-0 -4

Prerequisite(s): CS 14.302 (Software Engineering)

Objective(s):

- To explore the basics and goals of software testing
- To discuss various types of software testing and its techniques
- To list out various tools that can be used for automating the testing process
- To introduce various software quality standards for establishing quality environment
- To discuss various methods and evaluation procedures for improving the quality Models

6. **Basics of Software Testing**: Definition, test cases, insights from a Venn diagram, identifying test cases, error and fault taxonomies, levels of testing, examples: generalized pseudo-code, the triangle problem, the NextDate problem, the commission problem [6]
7. **Decision Table Based Testing:** Decision tables, test cases for triangle problem, test cases for Next Date problem, test cases for commission problem, data flow testing, use testing, slice based testing, guidelines and observation, traditional view of testing levels, alternative life-cycle models, separating integration and system testing, decomposition based, call graph based, path based integration, case study [10]
8. **System and Interaction Testing:** Threads, basic concepts of requirements specification, finding threads, structural strategies and functional strategies for thread testing, SATM test threads, system testing guidelines, interaction testing, a taxonomy of interactions, composition, and determinism, client-server testing, issues in object-oriented testing, inheritance and polymorphism, levels of object-oriented testing, GUI testing, dataflow testing for object-oriented software, examples and case study [10]
9. **Object-Oriented Integration Testing**: UML support for integration testing, MM paths for object-oriented software, GUI testing, unit testing, object-oriented system testing, UML based system testing, statechart based system testing [6]
10. **Quality Assurance:** Software quality, level of measurement, reliability and validity, Ishikawa's seven basic tools, cause and effect diagram, reliability models, quality and quality management metrics, software process maturity assessment [8]

Outcome(s): On successful completion the students will be able to:

- Compare and pick out the right type of software testing process for any given real world problem
- Carry out the software testing process in efficient way
- Automate the testing process by using several testing tools
- Establish a quality environment as specified in standards for developing quality software
- Analyze and improve the quality procedures based on the past experience

6. Mauro Pezze, Michal Young,"Software Testing and Analysis – Process, Principles and Techniques", John Wiley & Sons, 2008.

CS 14.424 **Machine Learning with Big Data** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 14.322 (Data Mining)

Objective(s): To learn the fundamental concept of machine learning and apply the concept of recommendations, clustering and classifications on large scale data sets using mahout.

6. **Introduction**: learning problems, designing learning system, perspectives and issues, concept learning, version spaces and candidate elimination algorithm, inductive bias, decision tree learning, representation, heuristic space search [8]
7. **Data Mining, Machine Learning** : Data mining ,machine learning, statistical modeling, feature extraction, computational approaches to modeling, statistical limits on data mining, statistical limits on data mining, Bonferroni's principle, recommendation engines, clustering and classifications, mahout : Mahout, installation and setting up of Mahout, tackling large scale data with mahout and Hadoop [8]
8. **Recommendations:** Defining recommendation, Running a recommender engine, Evaluating a recommender, Evaluating precision and recall, evaluating the GroupLens data set, representing preference data, in-memory data models, coping without preference values, user-based recommendation, item-based recommendation, similarity metrics, slope-one recommender, distributing recommendation computations [8]
9. **Clustering**: Clustering basics, measuring the similarity of items, running a simple clustering example, distance measures, representing data, visualizing vectors, representing text documents as vectors, generating vectors from documents, clustering algorithms in Mahout, k-means clustering, different kinds of clustering problems, fuzzy k-means clustering, model-based clustering, evaluating and improving clustering quality, real-world applications of clustering [8]
10. **Classifications**:Introduction to classification, Mahout for classification, differences between classification, recommendation, and clustering, applications of classification, working of classification, training a classifier, extracting features to build a Mahout classifier, preprocessing raw data into classifiable data, converting classifiable data into vectors, evaluating and tuning a classifier, deploying a classifier [8]

Outcome(s): Students would be able to apply learning and knowledge of machine learning techniquesin the area of Big Data Analytics using Mahoutto solve real life problems.

CS 14.426 **Wireless and Sensor Networks** **Total Lectures: 40**
Credit: 3-1-0 -4

Prerequisite(s): CS 14.306 (Computer Networks)

Objective(s):

- To provide an overview about wireless and sensor networks and emerging technologies
- To study about the network architecture of sensor nodes and its execution environment
- To understand the concepts of communication, MAC and routing protocols in WSN
- To learn about topology control and clustering for localization services with sensor tasking and control
- To study about sensor node hardware and software platforms and understand the simulation and programming techniques

6. **Overview of Wireless Sensor Networks**: Introduction, characteristics, challenges for WSN, emerging technologies for WSN, advantages of sensor networks, applications. [8]
7. **Architecture:** Single-node architecture, hardware components, energy consumption of sensor nodes, operating system and execution environment, network architecture, single hop vs multi hop, multiple sources and sinks, optimization goals and figures of merit, WSN gateway and tunneling. [8]
8. **Networking Sensors:** Physical layer, MAC protocols for WSN, low duty cycle and wakeup concept S-MAC, address and name management, assignment of MAC addresses, routing protocols, multipath unicast routing, energy efficient routing, geographic routing. [8]
9. **Infrastructure**: Topology control, clustering, multilayer clustering, time synchronization, localization and positioning, positioning in multihop environment, ranging techniques, range based localization, sensor tasking and control, information based sensor tasking, joint routing and information aggregation [8]
10. **Platforms and Tools:** Sensor node hardware, Berkeley motes, programming challenges, node level software platforms, TinyOS, nesC, TinyGALS, simulators, ns2, TOSSIM, state centric programming [8]

Outcome(s): On successful completion the students will be able to:

- Compare and pick out the right type of software testing process for any given real world problem
- Carry out the software testing process in efficient way
- Automate the testing process by using several testing tools
- Establish a quality environment as specified in standards for developing quality software
- Analyze and improve the quality procedures based on the past experience

Text Books:

3. KazemSohraby, Daniel Minoli, &TaiebZnati, “Wireless Sensor Networks- Technology, Protocols, And Applications”, John Wiley, 2007.
4. Anna Hac, “Wireless Sensor Network Designs”, John Wiley, 2003.

CS 14.418 **Software Defined Networking** **Total Lectures: 40**
Credit: 3-1-0 -4

Prerequisite(s): CS 14.302 (Software Engineering), CS 14.306 (Computer Networks)

Objective(s):

- To explore the basics of SDN
- To discuss various types plane
- To list out various controllers
- To program a simple SDN

6. **Control and Data Planes**: Introduction, evolution vs revolution, the control plane, data plane, moving information between planes, distributed control planes, convergence time, load balancing, creating the MPLS overlay, centralized control planes, logical vs literal, ATM.LANE, route servers. [8]
7. **SDN Controllers:** Wire protocol, replication, FAWG, hybrid approaches, SDN controllers, VMware, Nicira, OpenFlow, Mininet, NOX/POX, Trema, Ryu, L3VPN, RSPV-TE problem statement, bin-packing, deadlock, Plexxi, Cisco OnePK. [8]
8. **Network Programmability:** The management interface, the application-network divide, NETCONF and NETMOD, SNMP, modern programmatic interface, XMPP, JSON, I2RS, OpenStack, CloudStack, Puppet, virtual multitenant data center, SDN solution for data center networks. [8]
9. **Network Function Virtualization**: Virtualization and data plane I/O, services engineered path, service locations and chaining, NFV at ETSI, non-ETSI NFV work, network topology, LLDP, BGP-TE/LS, ALTO, I2RS topology. [8]
10. **Building an SDN framework:** Build code first, ask questions later, the Juniper SDN framework, IETF SDN framework, open daylight controller/framework, use cases for bandwidth scheduling, manipulation, data center overlays, big data, NFV, and traffic monitoring. [8]

Outcome(s): On successful completion the students will be able to:

- Describe the key benefits of SDN
- Describe the data plane
- Configure an SDN friendly network emulator
- Program a simple SDN for a given task using a low level approach and high level approach
- Evaluate a sample SDNs performance and reliability

6. Patricia A Morreale, James M. Anderson, “Software Defined Networking: Design and Deployment”, CRC Press, 2014.

CS-14.452 **Distributed Systems Laboratory** **Credit: 0-0-2-1**

Prerequisite(s): CS14.111(Programming Language Laboratory), CS 14.222(Java Programming Lab.)

Objective(s):

- To implement different abstractions of distributed systems.
- To understand the working principle of different theoretical abstractions like RMI, RPC, distributed shared memory etc.
- To understand the notion of logical clocks and event ordering in asynchronous distributed system through implementation

Content: Lab manual based upon the theory course CS 14.402 and to achieve the listed course objectives and outcomes

Outcome(s): On successful completion of this course, the students will be able to

- Analyze the working principles of different distributed system abstractions.
- Formulate programming models for DS concepts like RMI, RPC, distributed shared memory etc.
- Recognize event ordering in an asynchronous distributed system.

CS-14.472 **Major Project** **Credit: 0-0-0-10**

Prerequisite(s): CS14.111(Programming Language Laboratory)

Objective(s):

- To identify and formulate an engineering problem.
- To design a model or process to solve the formulated problem.
- To develop the solution by implementing the proposed design.
- To work in team to contribute to the development of project.
- To analyze and synthesize the product against critical and relevant parameters.

Content: Students will develop (preferably in a team) a project under guidance of faculty member based upon the area of interest of both student and faculty member.

Outcome(s): Preferably should cover most of the student outcomes.

CS-14.474 **Technical Seminar** **Credit: 0-0-0-1**

Prerequisite(s): NIL

Objective(s):

- To observe and analyze some latest technology.
- To comprehend the acquired knowledge.
- To present the acquired knowledge to larger audience.

Content: Students have to comprehend and present on some latest development in the field of computing. They have to submit a report also clearly mentioning the significance and limitations of the technology and its social impact.

Outcome(s): On successful completion of this course, the students will be able to

- Communicate effectively to arrange of audience.
- Recognize the need for continuous learning.
- Recognize the social impact of engineering solutions.

CS-18.307	Big Data Programming	Total Lectures: 40
		Credit:3-0-0-3
Prerequisite(s):	Basic knowledge of Linux • Basic SQL knowledge • Working knowledge with big data and Hadoop technologies • Have a basic understanding of notebook technologies for data science • Students can attend free courses at www.bigdatauniversity.com to acquire the necessary requirements • Exposure to the IBM Skills Academy Portal learning environment • Exposure to the IBM Skills Academy Cloud hands-on labs platform	
Objective(s):	• To Understand what Big Data is • To understand how the growth of interconnected devices helps big data. • To Learning the tools that will enable to continue big data education after the course	
1.	**BIG DATA OVERVIEW**: Introduction to Big Data, Introduction to the Big Data Ecosystem, Introduction to Hortonworks Data Platform (HDP), Apache Ambari, Hadoop and HDFS, MapReduce and YARN, Apache Spark, Storing and quering data, ZooKeeper, Slider, and Knox, Loading data with Sqoop, Security and Governance, Stream Computing, Exercise: Exploration of the lab environment, Managing Hadoop clusters with Apache Ambar, File access and basic commands with HDFS, Running MapReduce and YARN jobs, Creating and coding a simple MapReduce job, Working with a Spark RDD with Scala, Using Hive to access Hadoop/HBase data, Explore Zookeeper, Moving data into HDFS with Sqoop,	[20]
2.	**Introduction to Data Science**: Data Science and Data Science Notebooks, Data Science with Open Source Tools, Exercise: Moving data into HDFS with Sqoop	[5]
3.	**Big SQL**: Using Big SQL to access data residing in the HDFS, Creating Big SQL schemas and tables, File formats and querying Big SQL tables, Managing the Big SQL Server, Configuring Big SQL security, Data federation with Big SQL, Exercise: Connecting to the IBM Big SQL Server, Creating and managing Big SQL schemas and tables, Querying Big SQL tables, Managing the Big SQL Server, Configuring Big SQL security, Configuring impersonation in Big SQL, Using Fluid Query with Big SQL.	[9]
4.	**IBM Watson Studio:** Introduction to IBM Watson Studio, Analyzing data with Watson Studio,Exersice: Getting started with Watson Studio, Analyzing data with Watson Studio.	[6]
Outcome(s):	On the successful completion of the course, the student will be able to: • Hadoop and the Hadoop Distributed File System•Analyze the time and space complexity of algorithms. • Apache Spark. • ZooKeeper, Slider, and Knox	
Text Books:	1. IBM Study Material	
Reference Books:		

CS-18.205	Application Development for Cloud	Total Lectures: 40
		Credit:3-0-0-3
Prerequisite(s):	Basic knowledge of JavaScript. • Basic knowledge of Eclipse-based development tools • Basic understanding of HTML • Basic understanding of the IBM Skills Academy learning environment • Basic understanding of the IBM Skills Academy Cloud hands-on labs platform	
Objective(s):	To Define cloud computing • To Describe the choices that are available to developers when creating cloud applications • To Describe infrastructure as a service, platform as a service, and software as a service • To Describe IBM Cloud • To Describe the architecture of IBM Cloud	
1.	**CLOUD APPLICATION FOUNDATIONS**: Introduction to HTML5 and JavaScript Programming, JavaScript programming for web applications, HTML5 features,Exersices: Working with JavaScript in HTML documents, Working with HTML5 features	[8]
2.	**CLOUD APPLICATION DEVELOPER**: Essentials of Cloud Application Development, Introduction to cloud computing and IBM Cloud, Getting started with IBM Cloud, Developing IBM Cloud applications on a local workstation, Adopt a DevOps approach by using IBM Cloud Continuous Delivery, REST architecture and Watson APIs, Introduction to data services in IBM Cloud, IBM Cloud mobile backend as a service, Exercise: IBM Cloud command line interface (CLI), Develop IBM Cloud applications with Eclipse, Developing IBM Cloud applications with IBM Cloud Continuous Delivery, IBM Cloud with Cloudant,Build a mobile application by using Kinetise,	[20]
3.	**Developing Cloud Applications with SDK for Node.js**: Introduction to server-side JavaScript, Asynchronous I/O with callback programming, Express web application framework, Exercise :Developing a Hello World Node.js app on IBM Cloud, Understanding asynchronous callback, Creating your first express application, Understanding asynchronous callback Building a rich UI application by using AngularJS with Node.js	[12]
Outcome(s):	On the successful completion of the course, the student will be able to: •Understand asynchronous callbacks and be able to write the code in a Node.js application •Understand Express routing •Understand IBM Watson Natural Language Understanding service •Use the Fetch API to interact with back-end web services	
Text Books:	IBM Study Material.	
Reference Books:		

CS-18.338	Predictive Modeling Analytics	Total Lectures: 40
		Credit:3-0-0-3
Prerequisite(s):	• English Proficiency • Basic Internet and web browser usage experience • Basic analytics experience	
Objective(s):	□ To understand how analytics provided a solution to industries using real case studies □ To Explain what is analytics, the various types of analytics, and how to apply it □ To Improve efficiency, sample records, and work with sequence data □ To Integrate and collect data □ To Understand the principles of data mining	
1.	**Business Analytics Overview**: Analytics overview, Analytics trends, Towards a predictive enterprise, Analytics: Industry domains , Case studies and solutions. Business Intelligence and Analytics	[5]
2.	**Introduction to A Predictive Analytics Platform & Data Mining**: Introduction to data mining, Working with modeler, A Data-mining tour ,Collecting initial data , Understanding your data ,Setting the unit of analysis ,Integrating data ,Deriving and reclassifying fields, Looking for relationships ,Introduction to modeling , Exercise: On the basis of all above topics.	[10]
3.	**Advanced data preparation**: Using functions, Data transformations, Working with sequence data, Sampling records, Improving efficiency. Exercise on the basis of all above topics.	[10]
4.	**Automated Data Mining**: Introduction to data mining ,The basics of using a modeler ,Reading data files , Data exploration , Automated data preparation ,Data partitioning, Predictor selection for modeling ,Automated models for categorical targets , Model evaluation , Automated models for continuous targets ,Deploying models Exercise :Adding nodes and creating streams in the modeler ,Reading a data file and typing the data in the source node , Review missing values in modeler and use the data audit node on the charity data , Practice using the ADP node to prepare data for modeling ,Use a partition node to split the charity data for modeling ,Use the feature selection node to select fields and predict a response ,Using the auto classifier node to construct a model in order to predict a response, Evaluate the model created to predict the field response ,Develop a model to predict the total spending , Use a scoring stream to make predictions	[15]
Outcome(s):	On the successful completion of the course, the student will be able to: • Understand the principles of data mining • Use the user interface of modeler to create basic program streams • User a partition node to create training and testing data subsets • Use a model to score new data	
Text Books:	IBM Study Material.	
Reference Books:		

CS 18.409	Block Chain	Total Lectures: 40
		Credit: 3-0-0-3
Prerequisite(s):	• Basic knowledge of JavaScript, Node.js, Angular.js, Golang, Docker, and Kubernetes • Exposure to the IBM Skills Academy Portal learning environment • Exposure to the IBM Skills Academy Cloud hands-on labs platform	
Objective(s):	To Explain block chain and how it is applied across industries To Understand the benefits of a blockchain platform To Explain what is Hyperledger Composer, how it fits into blockchain, and its applications To Explain the elements of a business network, the role of channels, and how the world state is maintained To Understand block chain deployment, security and integration capabilities	
1.	**Blockchain overview**: What is Blockchain? The business backdrop, The problem area, Relation to Bitcoin, Difference between Bitcoin and Blockchain, Requirements for a blockchain in a business environment, Requirements deep dive, Apply blockchain to business, Why blockchain is relevant for business, Consensus: Shared Reference Data Example, Provenance: Supply Chain Example, Immutability: Audit and Compliance Example, Finality: Letter of Credit Example, Industry Use Cases, Hyperledger Composer, Hyperledger Fabric, Blockchain for Financial Services	[10]
2.	**Blockchain Foundations**: HTML5 overview, JavaScript programming for web applications, HTML5 features, Working with HTML 5 features, Node.js, Server-Side JavaScript, Creating a Node.js Web Application, Asynchronous I/O with callback programming, Refactor weather project, , Working with JavaScript in HTML documents.	[10]
3.	**Docker Essentials** : Introduction to Docker, Add value CI/CD with Docker Images, Introduction to Orchestration, Get started with Kubernetes, Virtual machines, containers, and Kubernetes, Relationship between Kubernetes and containers, Deploy an application with IBM Watson services.	[10]
4.	**Blockchain Developer:** Blockchain Overview, Introducing Hyperledger Composer, Understanding Blockchain Solution Architecture, Blockchain in-depth, Hyperledger Fabric Application Development, Understanding Blockchain Deployment Options, Understanding Blockchain Security, Blockchain Integrated, Applying blockchain concepts to the vehicle manufacture lifecycle use case, Developing a blockchain user application with Hyperledger Composer SDK, Developing a client application for Hyperledger Fabric, Integrating blockchain with other systems,	[10]
Outcome(s):	On the successful completion of the course, the student will be able to: • Understand blockchain and how it is applied across industries • Understand the role of a shared ledger • Understand the benefits of a blockchain platform • Understand what is Hyperledger Composer, how it fits into blockchain, and its applications • Understand the blockchain solution architecture	
Text Books:	IBM Study Material.	
Reference Books:		

CS 18.216	Application Security	Total Lectures: 40
		Credit: 3-0-0-3
Prerequisite(s):	• Basic web development knowledge • Basic knowledge on HTML and HTTP • Basic knowledge of application security	

	• Exposure to the IBM Skills Academy Portal learning environment • Exposure to the IBM Skills Academy Cloud hands-on labs platform	
Objective(s):	• To Describe the emerging threats and leaks as the world is becoming digitalized • To Understand the security dynamics of securing the enterprise • To Understand relational database concepts and how to work with database objects • To Describe how to work with select statements, DML statements, and multiple tables • To Understand how to use JOINs in SQL • To Understand the basics of HTML5 (objectives, document types that are supported, browser support etc.) • To Understand glass box scanning, content based scanning, and troubleshooting	
1.	**Cyber Security Overview**: Emerging threats and leaks as the world is becoming digitalized, The changing dynamics of securing the enterprise, A new approach to security, The foundation of approach to security the enterprise, IT Security Frameworks, Security Intelligence as a foundation of all security programs, IBM Security.	[5]
2.	**Application Security Foundations**: SQL Fundamentals, Relational database concepts, Working with database objects, Reading data, Inserting, updating, and deleting data, Working with multiple tables, exercises on Relational database exercise, Creating, modifying and deleting database objects ,Inserting, updating, and deleting data.	[9]
3.	**Introduction to HTML5 and JavaScript Programming:** HTML5 overview, JavaScript programming for web applications, HTML5 features, Working with JavaScript in HTML documents, Working with HTML5 features.	[9]
4.	**Web Application Security Fundamentals:** The web application security problem, Web application basics, Injection flaws, Broken authentication and session management, Cross-Site scripting, Insecure direct object reference, Security misconfiguration, Sensitive data exposure, Missing function level access control, Cross-site request forgery (CSRF), Using components with known vulnerabilities, Unvalidate redirects and forwards, Integrating security in the software development lifecycle	[9]
5.	**Web Application Security Solution Fundamentals:** Web application security overview, Installation and setup, Preparing for scan, Configuring first scan, Reviewing the results, Reporting, Logging in and managing sessions, Configuring explore options, Optimizing your scan, Glass box scanning, Content-based scanning, Reviewing scan coverage, Scanning web services, Extending the security web application solution, Troubleshooting,	[8]
Outcome(s):	• Understand relational database concepts and how to work with database objects • Describe how to work with select statements, DML statements, and multiple tables • Understand how to use JOINs in SQL • Understand the basics of HTML5 (objectives, document types that are supported, browser support etc.) • Understand the basics of JavaScript • Describe the web application security problem and web application basics	
Text Books:	IBM Study Material.	
Reference Books:		

CS 18.407	Artificial Intelligence	Total Lectures: 40
		Credit: 3-0-0-3
Prerequisite(s):	• English Proficiency • Exposure to the IBM Skills Academy Portal learning environment	
Objective(s):	• To Describe the field of AI and its subfields machine learning, NLP and computer vision • To Describe the types of AI • To Describe the types of machine learning: Supervise learning, unsupervised learning, and deep learning • To Describe the purpose of training the various Watson services to adapt them to a closed-domain • To Use Watson API Explorer to interact with the Watson services REST API, to rest your calls to the • To Define chatbots • To Explain the factors that lead to the growing popularity of chatbots • To Identify applications that are good candidates to integrate with chatbots • To Describe the main components that are involved when building a chatbot and explain their purpose • To Describe how to build a chatbot by using the IBM Watson Conversation service	
1.	**Artificial intelligence overview**: Introduction to Artificial Intelligence, Machine Learning, Natural Language Processing, Computer vision, Cognitive Computing.	[5]
2.	**Artificial intelligence foundations**: Introduction to IBM Watson, Evolution from DeepQA to Watson services on IBM Cloud, Build with Watson, Exploring Watson services with Watson API Explorer.	[10]
3.	**Artificial intelligence analyst:** Introduction to Natural Language Processing, Pipeline and concepts, NLP and IBM Watson, Exercises on Ingest, Convert, Enrich, and Query with Watson Discovery Service.	[10]
4.	**Chatbots:** Introduction to Chatbots, Chatbot fundamentals, IBM Watson conversation service.	[8]
5.	**Computer Vision:** Introduction to Computer Vision, Computer Vision fundamentals, IBM Watson Visual Recognition service, Exercise on Classifying images with Watson Visual Recognition.	[7]
Outcome(s):	Understand the relationship between AI and NLP Know the history and advancement of Computer Vision Understand Computer Vision components Learn about the Vision services that are available from IBM Watson.	
Text Books:	IBM Study Material.	
Reference Books:		

CS 18.210	Business Intelligence	Total Lectures: 40
		Credit: 3-0-0-3
Prerequisite(s):	• English proficiency • Microsoft Windows operating system basic experience • Basic Internet and web browser usage experience • Knowledge of an organization's business intelligence and reporting needs • Basic database background is preferred • Basic knowledge of XML is preferred • Exposure to the IBM Skills Academy portal learning environment • Exposure to the IBM Skills Academy cloud hands-on labs platform	
Objective(s):	• To Understand how analytics provided a solution to industries using real case studies • To Explain what is analytics, the various types of analytics, and how to apply it • To Understand how a business analysis software works, and its architecture • To Describe a reporting application, its interface, and the different report types • To Create different types of advanced reports • To Understand Active Reports and how to create them	
1.	**Business Analytics Overview**: Analytics overview, Analytics trends: past, present & future, Towards a predictive enterprise, Analytics: Industry domains, Case studies and solutions.	[5]
2.	**Business Intelligence and Analytics 101 and Business analytics foundations**: Business Intelligence and Analytics 101, IBM Cognos Analytics for Consumers, Business analysis solution for consumers.	[7]
4.	**Business intelligence analyst:** IBM Cognos Analytics: Author Reports Fundamentals, Introduction to IBM Cognos Analytics, Create list reports, Focus reports using filters, Create crosstab reports, Present data graphically, Focus reports using prompts, Extend reports using calculations, Use additional report building techniques, Customize reports with conditional formatting, Drill-through definitions, Enhance report layout, Overview of IBM Cognos Analytics	[12]
5.	**IBM Cognos Analytics: Author Reports Advanced:** Create query models, Create reports based on query relationships, Create advanced dynamic reports, Design effective prompts, Create additional advanced reports, Examine the report specification, Distribute reports through bursting, Enhance user interaction with HTML.	[11]
6.	**IBM Cognos Analytics: Author Active Reports:** Introduction to IBM Cognos Active Reports, Use Active Report connections, Active Report charts, visualizations, and decks.	[5]
Outcome(s):	• Describe a reporting application, its interface, and the different report types • Create different types of advanced reports • Understand Active Reports and how to create them	
Text Books:	IBM Study Material.	
Reference Books:		

CS 18.309	Security Intelligence	Total Lectures: 40
		Credit: 3-0-0-3
Prerequisite(s):	• Basic understanding of the security fundamentals • Basic understanding of the IT infrastructure and IT security fundamentals • Basic understanding of Linux, Windows, TCP/IP networking and Syslog • Exposure to the IBM Skills Academy Portal learning environment • Exposure to the IBM Skills Academy Cloud hands-on labs platform	
Objective(s):	Identify enterprise business and IT drivers that influence the overall IT Security Architecture Define the role of a centralized Security Intelligence solution and how it integrates with other IT enterprise security components Explain how a Security Intelligence solution can be used to investigate and stop advanced threats and address IT governance and regulatory compliance Describe how QRadar SIEM collects data to detect suspicious activities Navigate and customize the QRadar SIEM dashboard Investigate suspected attacks and policy breaches Search, filter, group, and analyze security data Investigate the vulnerabilities and services of assets Locate custom rules and inspect actions and responses of rules Use QRadar SIEM to create customized reports Use charts and apply advanced filters to examine specific activities in your environment	
1.	**Cyber Security Overview**: The status quo of IT Security, Security intelligence and operations,	[5]
2.	**Cyber Security Foundations**: Security Intelligence Fundamentals, Designing a security intelligence solution, Security intelligence functional components,	[10]
3.	**SECURITY INTELLIGENCE ENGINEER:** Security Intelligence Solution Foundations, Introduction to Security Intelligence Solution SIEM, How Security Intelligence Solution SIEM collects security data, Using the Security Intelligence Solution SIEM dashboard, Investigating an offense that is triggered by events, Investigating the events of an offense, Using asset profiles to investigate offenses, Investigating an offense that is triggered by flows, Using rules and building blocks, Creating Security Intelligence Solution SIEM reports, Perform advanced filtering	[10]
Outcome(s):	Understand the relationship between AI and NLP Know the history and advancement of Computer Vision Understand Computer Vision components Learn about the Vision services that are available from IBM Watson.	
Text Books:	IBM Study Material.	
Reference Books:		

CS 18.214	Developing IoT based Applications	Total Lectures: 40
		Credit: 3-1-0-4
Prerequisite(s):		
Objective(s):	An introduction the idea of collaborative devices working together to achieve a larger goal is not new. Beginning from the simple operational definition, the session will outline the historical perspective right from pre-internet era, specific machine-to-machine communication context aware computing to wearables. It will conclude architecture of Internet of Things (IoT).	
1.	**Unpacking Internet of Things**: What is IoT,Why IoT,Journey of IoT, Business Use cases of IoT, Brainstorming on various IoT use cases on any two Domains like- (Manufacturing , Buildings , Agriculture , Energy & Utilities , Worker Safety),Available programming languages for IoT enabled applications,Basic commands and board configurations,Integration IoT on Arduino.	[5]
2.	**Introduction to basic hardware interfaces and proteus simulation:** Describe a development platform, Describe the architecture of a development platform, Introduction to sensor and hardware (LED, ultrasonic Sensor, Flame sensor, DHT sensor, LCD etc.), Introduction and installation of proteus, Introduction to LED, Writing of LED blinking program on Arduino IDE with hardware implementation,Introduction to seven segment display and its working,Introduction to LCD and describing how digital display works, Writing code for LCD to display sensors results,Descriptive explanation of analog and digital conversion in electronics,Descriptive explanation of Pulse Width Modulation in electronics	[9]
3.	**Introduction to various sensors and their interface with Arduino:** Introduction to ultrasonic sensor and describing how ultrasonic sensors works, Writing code for ultrasonic sensor and display result in Serial Monitor,Introduction to Flame sensor and describing how Flame works, Writing code for Flame sensor to calculate ppm value and display result in Serial Monitor,Introduction to DHT sensor and describing how DHT sensors works, Writing code for DHT and display result in Serial Monitor,Introduction to LDR and describing how it works, writing code it,Introduction, to IR and describing how it works, Writing code for it,Introduction to LM35 and its application	[9]
4.	**Advanced Modules Interfacing And Assignments:** Introduction to Bluetooth and describing how Bluetooth works, Writing code for HOME AUTOMATION,Introduction to GSM and introduction to AT commands, write a code to call/message other phone using AT commands through arduino,write code to upload temperature sensor value on Cloud ,Introduction to Wi-Fi and new modules avail in the market, Write some code on ARDUINO for ESP8266 to upload sensors value on web,Introduction to Acc. describing how it works, Writing code for it	[9]
5.	**ASSIGNMENTS:** Displaying text on LCD ,Scrolling text on LCD,Displaying numbers on LCD ,IOT based agricultural field monitoring and controlling,IOT Based office home security with auto capture on intruder and sending alert,IOT based digital notice board for college ,IOT based contactless liquid level monitoring with empty and full alert ,IoT based home automation with fault switch,IoT based agricultural field monitoring and controlling, Project discussion.	[8]
Outcome(s):	• Unpacking Internet of Things • Getting introduced to IoT • Business Use cases of IoT • Embed various sensors with iot platform and simulate them on virtual simulation software proteus • Creating account on iot cloud platform and setting up communication between arduino and cloud platform.	
Text Books:	IBM Study Material.	
Reference Books:		

CS 17.302 **Advanced RDBMS** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): Database Management System

Objective(s): To acquire fundamental knowledge of Software designing using UML.

1.	Overview of DB2 9 on Linux, UNIX and Windows, Command Line Processor (CLP) and GUI usage, The DB2 environment.	[12]
2.	Creating databases and data placement, Creating database objects, Moving data.	[10]
3.	Backup and recovery, Locking and concurrency, Investigating DB2 locking.	[10]
4.	Problem determination, Application issues and performance, Application performance tools, Security.	[8]

Outcome(s): After completion of this course student get the understandings of advance concepts of Database design and security.

Text Books: **1.** RamezElmasri, Shamkant B. Navathe, "Fundamentals of Database Systems",Pearson Education, 7th Edition, 2015.

2. AviSilberschatz , Henry F. Korth and S. Sudarshan, "Database System Concepts", McGraw-Hill, 6th Edition, 2011.

Reference Books: **1**. Jeffrey A. Hoffer, Mary B. Prescott and Fred R. McFadden, "Modern DatabaseManagement", Prentice Hall, 8th Edition, 2006.

CS 17.208 **Essentials of Software Engineering (OOAD & SW Lifecycle)** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): Object Oriented Technologies

Objective(s):

- To acquire fundamental knowledge of Software designing using UML.

1. **Software Engineering Overview:** Best Practices of Software Engineering Concepts of Object Orientation Essentials of Visual Modeling Requirements Overview [12]
2. **Requirement analysis**: Analysis and Design Overview Architectural Analysis Use-Case Analysis Identify Design Elements [10]
3. **Design analysis**: Identify Design Mechanisms Describe the Run-time Architecture Describe Distribution Use-Case Design Objectstore Mechanism Security Mechanism. [10]
4. **UML and mapping**: UML to C++ Mapping UML to Java Mapping UML to Visual Basic Map UML to Visual Basic Map [8]

Outcome(s):

- After completion of this course student get the understandings of object-oriented analysis and design concepts, as well as hands-on practical experience applying the techniques within a use-case-driven, architecture-centric, and iterative development process.

Text Books:

1. Pressman R.S., "Software Engineering", Tata McGraw Hill Publishing Company Ltd., New Delhi.
2. Sommerville, Ian "Software Engineering", Pearson Education

Reference Books:

1. Jalote Pankaj, "An Integrated Approach to Software Engineering", NAROSA.
2. Fairely, R.E., "Software Engineering Concepts", McGraw-Hill

CS 17. 204 **R Programming** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): Programming Language(CS 14.101)

Objective(s):

- To understand and learn programming concepts of R
- To Apply R programming to solve various statistical, graphics and modeling problems

1. **Fundamentals of R** : Evolution of R, Features of R, R environmental Setup, R Script file, Data types- Vectors, Lists, Matrices, Arrays, Factors, Data Frames, Variables, finding and deleting variables, Operators in R. [6]
2. **Control Statements in R**: if-else statement, switch statement, Repeat loop, while loop, for loop, break statement, next statement [8]
3. **Functions, Strings and Vectors :** Function Definition , Function Components Built-in Function, User-defined Function, Calling a Function, Lazy Evaluation of Function, Strings and Strings Manipulation, Vector creation, accessing vector elements, vector manipulation, [10]
4. **Lists, Matrices and Arrays :** List Creation, Naming list elements, Accessing list elements, Manipulating list elements, Merging list, Converting list to Vector, Accessing elements of matrix, matrix computations, Naming row and column of array, accessing array elements, manipulating array elements, calculation across array elements [10]
5. **Data frames, factors and packages:** Extract data from data frame, expand data frames, factors in data frames, changing the order of levels, generating factor levels, packages [6]

Outcome(s): After completing the course the student is expected to

- be able to use and program in the R programming language
- be able to use R programming to solve statistical problems
- be able to apply R Programming concept to solve real world problems

Text Books:

1. Hadley Wickham, Garrett Grolemund, R for Data Science, O'Reilly, January 2017.
2. John Maindonald and John Braun, Data Analysis and Graphics Using R, Cambridge University Press, Cambridge, 2007.

Reference Books:

1. Peter Dalgaard, Introductory Statistics with R, Springer Verlag, 2008.
2. Phil Spector. Data Manipulation with R. Springer, New York, 2008.

CS 17. 254 **R Programming Laboratory** **Credit: 0-0-2-1**

Prerequisite(s): CS14.111(Programming Language Laboratory)

Objective(s):

- To learn R programming constructs
- To learn use R for statistical analysis
- To learn R for modeling.

Contents: Lab manual based upon the theory course CS 17.204 and to achieve the listed course objectives and outcomes.

Outcome(s): On successful completion of this course, the students will be able to

- Write programs using R programming
- Use R programming for statistical analysis of data
- Use R programming for data visualization
- Use r programming for problem modeling

CS 17.101 Software Foundation and programming with C

Total Lectures: 40
Credit:3-0-0-3

Prerequisite(s): CProgramming, FundamentalofComputers

Objective(s): Tounderstandtheadvancedconceptofcprogrammingtosolve therealworldprogramming problems.

1. **PointersinC**:Pointers,declaringpointervariables,dereferencingandaddressofoperators, pointerexpressionandpointerarithmetic,nullpointers,genericpointers,passingarguments to function using pointers, pointers and array, handling multidimensional array using pointers,passing anarray toafunction,pointersand strings,arrayofpointers, pointer-to-pointer,function pointers, dynamic memoryallocationfunctions-malloc(), calloc(), realloc (), free(), drawbacks ofpointers-memoryleak, danglingpointer, memorycorruption [9]
2. **FileHandlinginC**:Streams-stdin,stdoutandstderr,typesoffiles-textfileandbinaryfile, file pointer,file modes-r,w,a,rb,wband ab, filehandlingfunctions-fopen(), fclose(),fscanf( ), fread(), fgetc(), fgets(), fprintf( ),fputc(),fputs(), fwrite(),ferror( ),feof(),fseek( ), ftell( ),rewind( ),fgetpos(), fsetpos(),remove(), rename () [5]
3. **SearchingandSorting-**Searchingtechniques-linearsearch,binarysearch,hashing,sorting techniques-bubblesort, insertionsort,selectionsort, quick sort,mergesort,heapsort,shell sort, radixsort, bucketsort [6]
4. **Stack,QueueandLinkedList**:Introductiontodatastructures,linearandnon-lineardata structures,stack,push and popoperations on stack, applicationofstacks,queue,circular queue,priority queue,deque,insertionanddeletion operations inqueue, linkedlist, single linkedlist,circular linkedlist, double linked list, insertion, deletion andsearching inlinked list, application of linked lists [12]
5. **TreesandGraphs:**Binarytree,Binarysearchtree,AVLtree,Red-Blacktree,Splaytree, B+ tree, insertion , deletion and searching operations on trees, graph terminologies, operations ofgraphs [8

Outcome(s): Upon successfulcompletion ofthe course ,studentswillbe ableto
-solve complex programmingproblems usingthe conceptsofpointers
-handle variousfile operations inc forrealworld applications
-implementvarious data structures usingc language

Text Books: BrainW.Kernighanand DennisM. Ritchie,The C ProgrammingLanguage, Second edition, Pearson Education,2013
D. Samantha, Classic DataStructures, Second edition,PHIlearning, 2013

Advance Object Oriented Programming

Course code: **CS17.102** **TotalLectures:40**
Credit:3-0-0-3

Unit1–Basic Concepts: core object concepts (Encapsulation, Abstraction, Polymorphism, Classes, Messages Association,Interfaces), Concept of inheritance.Derived class and based class.[3]

Unit2–CoreJava: managing memory with garbage collector,abstraction,accessspecifiers,Collection framework, keywords (static, final, abstract etc.),SwingAPI [9]

Unit3–Java Database Connectivity(JDBC):accessingdatafrom tables:Joining, manipulating Databases with JDBC, Prepared Statements, Transaction Processing, [4]

Unit4–Modeling&Practice:UML diagrams (structural& behavioral),ERdiagrams, DataFlow Diagrams (DFD), logicalcomplexity, effective modularization.Case study:automationtools,agile testingstrategy, agilesprints [6]

Unit5–
Servlets: Servlet Overview and Architecture, Interface Servlet and the Servlet Life Cycle, Handling HTTP get Requests, Handling HTTP post Requests, Redirecting Requests to Other Resources, using cookies [6]

Unit6–JavaServerPages (JSP): Introduction, Java Server Pages Overview, A First JavaServerPage Example,ImplicitObjects, Scripting, StandardActions,Directives,CustomTag Libraries [7]

Unit7–Introduction to Application Development: Introduction to android platform, Creating application template, addingactivity,intent, services to application, usingGoogle mapAPI [5]

ReferenceBook:

1. “Advanced Java2 Platform HOWTO PROGRAM”byH. M.Deitel, P. J. Deitel, S. E. Santry– PrenticeHall

– Apress publication

CS 16.104 **Programming Language-C++** **TotalLectures:40**
Credit:3-0-0-3

Prerequisite(s): CProgrammingand Fundamentals ofComputers

Objective(s): Tofamiliarizethestudentswith basicconceptsofobject oriented programminganddeveloper tools.
Topresentthe syntaxandsemanticsof theC++ Programming

1. **Object OrientedProgramming:** Basic concepts of object–oriented programming, Structured versusobject- oriented programming, merits and demerits of object oriented methodology — 6
2. **Beginning With C++:** Preprocessor directives, Variables, data types, constants, operators,scoperesolution operator, memory management operators,decision and loop controls,arrays,strings,functions. — 6
3. **Classes And Objects:** Class definition, Structure versus class, accessing member functionswithinaclass,datahiding,arrayswithinaclass,staticdataandmember functions, objects, friend functions and friend classes, constant member functions, pointerstomembers,constructorsand destructor — 8
4. **OverloadingandExceptionHandling:**Definition,unaryoperatoroverloading,binary operators overloading,overloadingofnewanddelete operators, manipulationof string usingoperators,type conversion, overloadingwith friendfunctions,function overloading, error and exception handling — 8
5. **InheritanceandOverriding:**Derivedandbaseclasses,typeofinheritance,derivedclass constructors anddestructor, overridingmemberfunctions,public andprivate inheritance,virtual base classes,abstractclasses,thispointer,virtual functionsand pure virtual functions, staticand dynamicbindings — 8
6. **I/O StreamsandTheStandardLibrary:**Header files, I/O streamlibrary, stream I/O forobjects,FileI/O — 4

Outcome(s): At theendofcourse,studentshaveagoodunderstandingabouttheconceptofobject-oriented programmingusingC++andableto writeandread C++codefor real worldapplications

Chemistry Cycle: Group II – ECE+EE+ME+MBA (Tech.)-CSE/ECE

MA-14.101 **Mathematics-I** **Total Lectures: 40**
3-1-0-4

Objective: To acquire fundamental knowledge of Mathematics and apply in engineering disciplines.

1. **Calculus:** Review of basic concepts, partial differentiation, Euler's theorem on homogeneous functions, Taylor's series and Jacobian, maxima and minima of functions of two variables, asymptotes, tracing of simple Cartesian curves, length of plane curves, area bounded by the curves, multiple integrals (double and triple integrals, change of order of integration), physical interpretations and applications. [16]
2. **Three-dimensional Geometry:** Direction cosines and direction ratios of a straight line, equation of a plane, plane passing through intersections of two planes, equations of straight line, shortest distance between two skew lines, equation of a sphere, intersection of plane and sphere. [10]
3. **Matrix Theory**: Rank of matrix, linear dependence and independence of vectors, solution of system of simultaneous linear equations, Eigen values, Eigen vectors of a matrix, statement of Cayley-Hamilton theorem (without proof) , reduction of a matrix to diagonal form, quadratic forms, linear transformation of a quadratic form, and applications. [10]
4. **Theory of Equations**: Introduction of polynomials, relation between roots and coefficients, Cardon's method. [4]

Outcome: After completion of the course, students would be able to apply mathematical knowledge in engineering and solve curriculum problems.

Text Books:

MA-14.102 **Mathematics-II** **Total Lectures: 40**
3-1-0-4

Objective: To acquire fundamental knowledge of Mathematics and apply in engineering disciplines.

1. **Computational Methods:** Introduction and importance of numerical analysis, calculus of finite differences, interpolation schemes for equal and unequal intervals (Newton's forward and backward interpolation formulae), divided difference, interpolation for unequal intervals (Newton's divided difference and Lagrange interpolation formulae), Solution of algebraic and transcendental equations by Newton-Raphson method. Applications to Engineering. [13]
2. **Ordinary Differential Equations:** First order and first degree differential equations (variable separable, homogeneous, linear, exact equations. Linear differential equations of second order with constant and variable coefficients (complementary functions and particular integrals), and applications. [12]
3. **Partial Differential Equations:** Formation of partial differential equations, Lagrange's multipliers method for solution of first order differential equations, separation of variables for nonlinear differential equations and applications. [5]
4. **Vector calculus:** Vector and scalar point functions, conservative fields, gradient of scalar point functions, divergence and curl of vector point functions (Solenoidal and irrotational vectors), directional derivative of scalar point functions, work done along a curve, Integration of vectors, line integral (work done), surface integral, volume integral, physical interpretations and applications. [10]

Outcome: After completion of the course, students would be able to apply mathematical knowledge in engineering and solve curriculum problems.

PY-14.101 **Engineering Physics** **Total Lectures: 40**

3-0-0-3

Objective: To make a bridge between the physics in school and engineering courses.

1. **Modern Physics**: Introduction to Black body radiation spectrum, Photo-electric effect, Compton effect. Wave particle Dualism. de Broglie hypothesis – de Broglie wavelength, extension to electron particle. Davisson and Germer Experiment. [8]
   Matter waves and their Characteristic properties, Phase velocity, group velocity and Particle velocity, Relation between phase velocity and group velocity, Relation between group velocity and particle velocity. Expression for deBroglie wavelength using group velocity.
2. **Quantum Mechanics:** Heisenberg's uncertainity principle and its physical significance. Application of uncertainty principle (Non-existence of electron in the nucleus, explanation for decay and kinetic energy of electron in an atom). Wave function, Properties and physical significance of wave function, Probability density and Normalization of wave function. Setting up of one dimensional time independent Schrodinger wave equation. Eigen values and Eigen functions. Application of Schrodinger wave equation – Energy Eigen values for a free particle. Energy Eigen values and Eigen functions for a particle in a potential well of infinite depth. [7]
3. **Electrical Conductivity in Metals**: Free–electron concept. Classical free-electron theory – Assumptions. Drift velocity, Mean collision time and mean free path. Relaxation time. Expression for drift velocity. Expression for electrical conductivity in metals. Effect of impurity and temperature on electrical resistivity of metals. [8]
   Quantum free-electron theory – Assumptions. Fermi – Dirac Statistics. Fermi-energy, Fermi factor. Density of states (No Derivation). Expression for electrical resistivity / conductivity. Temperature dependence of resistivity of metals. electron in a periodic potential, origin of the energy gap, band theory of solids, distinction of solids into metals, semi-conductors and insulators.
4. **Dielectric & Magnetic Properties of Materials**: Dielectric constant and polarization of dielectric materials. Types of polarization. Equation for internal field in liquids and solids (one dimensional). Ferro and Piezo electricity. Frequency dependence of dielectric constant. Important applications of dielectric materials. Classification of dia, para and ferro-magnetic materials. Hysterisis in ferromagnetic materials. Soft and Hard magnetic materials. Applications. [7]
5. **Lasers and Optical Fibers**: Einstein's coefficients (expression for energy density). Requisites of a Laser system. Condition for laser action. Principle, Construction and working of CO2 laser and semiconductor Laser. Applications of Laser – Laser welding, cutting and drilling. [10]
   Measurement of atmospheric pollutants. Holography–Principle of Recording and reconstruction of images, applications of holography.
   Propagation mechanism in optical fibers. Angle of acceptance. Numerical aperture. Types of optical fibers and modes of propagation. Attenuation. Applications–Block diagram discussion of point to point communication.

Outcome: The student will be able to understand many modern devices and technologies based on lasers and optical fibers. Student can also appreciate various material properties which are used in engineering applications and devices.

Text Books: S. O. Pillai, "Solid State Physics", Sixth Edition, New Age International
V. Rajendran, "Engineering Physics," TMH

Reference Book: G. K. Shivkumar, "Engineering Physics," Prism Book Pvt. Ltd.

CY-14.101 **Engineering Chemistry** **Total Lectures: 40**
3-0-0-3

Objectives:
1. To purify the most valuable natural resource of the future-water.
2. To understand one of the most versatile Engineering Materials: Polymers their preparation, properties and uses.
3. To develop the basics of protecting engineering materials from the natural forces.
4. To understand the present day up-to-date knowledge of the contemporary energy sources.
5. To build up the basis of the future Engineering materials like superconductors, conducting organic polymers, Nano materials etc.

1. **Water treatment:** Hardness, types of hardness, Determination of hardness by complexometric (EDTA) method, Degree of hardness, Boiler troubles: corrosion, sludge and scale formation, Prevention of sludge and scale formation in boilers. Methods of Boiler Water Treatment: Lime-Soda process, Permutit (Zeolite) process, ion exchange methods. Numerical problems based on water treatment (Lime-Soda process). [10]
2. **Organic and Inorganic Polymers:** Classification, Functionality, Types of polymerization, Mechanism of Addition polymerization. Plastics: thermoplastic and thermosetting resins. Preparation, Properties and Uses of Polyamides, Bakelite, Polyesters, Rubber, Vulcanization of Rubber, Synthetic Rubber viz. Buna-S, Buna-N, Butyl and Neoprene rubbers. Silicones-polysiloxanes and sulphur based polymers. [8]
3. **Electrochemistry and Corrosion:** Electrochemical Changes, Electrochemical cell and its classifications (Galvanic cell, electrolytic cell) Types of electrodes (Reference electrodes-Standard Hydrogen Electrode, Indicator electrodes- Glass Electrode), Origin of electrode potential, Nernst equation of electrode potential. Electromotive force, Electrochemical Series. Corrosion: Definition and its significance, Theories of corrosion, Mechanism of corrosion, types of corrosion, Galvanic cell, and concentration cell, Water line corrosion, Pitting & Stress corrosion (Caustic embrittlement), Protection against corrosion, Corrosion control (Corrosion inhibitors, Cathodic protection - sacrificial anodic and impressed current cathodic protection), protective metallic coatings. [10]
4. **Fuels:** Classifications of fuels, Comparison of solid, liquid & solid fuels, Calorific value of a fuel. Bomb calorimeter, Determination of LCV & HCV, Petroleum: origin, composition, processing, cracking, synthetic petrol, refining, reforming, knocking, unleaded petrol, LPG as a gaseous fuel. Numerical problems based on combustion. [6]
5. **New Engineering Materials:** Introduction: Superconductors, high and low temperature superconductors, organic electronic materials, Fullerenes and Nano materials, Industrial applications of fullerenes and Nano materials. [6]

Outcomes: The student will be able to understand the basis of the future Engineering materials like of superconductors, conducting polymers, Nano materials etc and purification of the most valuable natural resource of the future-water.

Text Books:
Jain and Jain, "Engineering Chemistry," 15th Edition, 2006, Dhanpat Rai Publishing Company.
S.S. Dara, "A Text Book of Engineering Chemistry," 9th Edition, 2001, S. Chand & Company Limited.

Reference Books:
Atkins, "Physical Chemistry," 7th edition P.W.

J.F. Shakelford, M.K.Murlidhara, "Materials Science for Engineers," 6th Edition.
Bokris and Reddy, "Modern Electrochemistry I," 2nd Edition, Springer.

ME-14.101 **Applied Mechanics** **Total Lectures: 40**
3-1-0-4

Objectives:
1. This course will help the student to acquire knowledge of basic engineering mechanics concepts and enhance their ability to solve open ended engineering problems.
2. To provide the student with a clear and thorough understanding of the theory and applications of engineering mechanics, covering both statics and dynamics.
3. To provide the student with a thorough understanding of the concept, drawing, and the use of free-body diagrams.
4. To be able to determine the Centre of Gravity and Moments of Inertia
5. of simple geometric shapes and understand the physical applications of these properties.
6. To understand the use and be able to perform calculations related to friction forces in engineering applications.

1.	**Introduction:** Idealization of Mechanics, concept of Rigid Body, External Forces (Body forces & surface forces), Laws of Mechanics.	[3]
2.	**Force Systems and Equilibrium:** Introduction to vector, Statically Equivalent Force systems, Free Body Diagram, Equations of equilibrium and their applications to various system of forces.	[8]
3.	**Distributed Forces and Moment Of Inertia:** Centroid of Composite figures, Area Moment of Inertia, Mass Moment of Inertia, Principle axes and Principle Moment of Inertia.	[5]
4.	**Friction:** Introduction of friction, Laws of friction, wedge, screw, belt, rolling friction.	[5]
5.	**Tension, Compression and Shear:** Normal stress and strain, Linear elasticity, Hooke's Law and Poisson's Ratio, Shear stress and shear strain, Relationship between modulus.	[4]
6.	**Beams:** Different support & load conditions, SFD, BMD	[5]
7.	**Kinematics of Particles:** Introduction, Rectilinear motion, Plane curvilinear motion**,** Rectangular coordinates, Tangential and normal coordinates, polar coordinates, Relative motion (Translating Axes), constrained motion of connected particles.	[5]
8.	**Kinetics of Particles:** Introduction, Force, Mass and acceleration, Newton's second law of motion, Equation of motion and solution of problems, Work and Energy, Impulse and Momentum.	[5]

Outcome: The students shall develop the ability to identify, formulate, and solve engineering problems related to forces and motion.

Text Books: Timoshenko, S, Young, D.H, Rao, J.V, "Engineering Mechanics," 4th edition TMH, 2010.
Merian, J.L, Kraige, L.G., "Engineering Mechanics Vol I & II," 5th edition Wiley India 2010.

Reference Books: Hibbeler, Gupta R. C., "Engineering Mechanics," 11th ed.,Pearson India, 2010.

Irving. H. Shames, "Engineering Mechanics," Prentice Hall Book Company, 1966.

EE-14.101 **Elements of Electrical Engineering** **Total Lectures: 40**
3-1-0-4

Objective: This course facilitates the students to get a comprehensive exposure to various concepts and devices of electrical engineering.

1. **Introduction:** Background, major inventions, scope, significance and job opportunities in electrical engineering, brief overview of various energy resources. Apparatus used in generation, transmission and distribution of electrical power and various industries. [3]
2. **D.C. circuits:** Review of circuit elements, voltage sources, current sources, ohms law, KVL, KCL, source transformation, mesh current and node voltage analysis of circuits. [5]
3. **Network Theorems:** Superposition theorem, Thevenin's theorem, Norton's theorem, Maximum Power Transfer theorem, star-delta transformation. [6]
4. **Single phase A.C. circuits:** Basic terminologies, average & rms values of a.c. quantities, phasor representation, response of R, L, C and their combination to a.c. excitation, concept of power and power factor in a.c. circuits. [6]
5. **Three phase A.C. circuits:** Three phase supply, phase sequence, star connection, delta connection, relationship between phase and line quantities in 3-phase circuits, measurements of three phase power under balanced condition. [6]
6. **Magnetic Circuits & Transformer:** Magnetic circuit, mutually coupled circuit, Transformer: working principle, emf equation, ideal & practical transformer, Equivalent circuits, Transformer testing: open circuit and short circuit test, losses, voltage regulation and efficiency. [8]
7. **Rotating Machines**: Electro-mechanical energy conversion, introduction to rotating machines and applications. [6]

Outcome: The students shall develop an insightful knowledge on various fundamental elements and devices of electrical engineering.

Text Books: Nagrath & Kothari, "Theory and problems of Basic Electrical Engineering," 2nd edition PHI Publication.
Fitzgerald & Kingsley, "Basic electrical Engineering," 3rd edition TMH publication.

Reference Books: H.Cotton, "Advanced Electrical Technology," CBS Publication.

Vincent Del Toro, "Electrical Engineering Fundamentals," 2nd Edition PHI Publication.

EC-14.101 **Basics of Electronics Engineering** **Total Lectures: 40**

3-1-0-4

Objective: This course would facilitate the learner to acquire good exposure to electronics and communication engineering.

1. **Introduction**: Brief history of major inventions, scope, significance and job opportunities in electronics and communication engineering, Overview of various specializations in ECE, Electronic test and measurement equipments, Specifications for electronic components. [3]
2. **Semiconductors**: Material and its properties, Formation of energy band diagram, Currents in semiconductors, Fermi-Dirac energy distribution, Types of semiconductors – Intrinsic and Extrinsic, Mass action law, Hall effect. [5]
3. **Diodes**: Introduction, Characteristic of ideal and real diode, Current components in diode, load characteristics, Breakdown in diode, Zener diode, Varactor diode, Tunnel diode, Clippers and Clampers, Rectifiers – Half and Full-wave rectifiers. [8]
4. **Transistors:** Introduction to pnp and npn transistors, current components, active, cutoff and saturation regions, CC, CB and CE configuration, Operating point, Biasing circuits, Bias Stability, Thermal runway and thermal stability. [8]
5. **Signals**: Definition, Classification of signals – Analog and Digital, Deterministic and Random signals, Power and Energy of signals, Bandwidth, Bit and Baud rate. [4]
6. **Basics of Communication**: Definition, Block representation of communication system, Modulation – Definition, Need of modulation, Frequency translation, Types of modulation - Analog and Digital, Multiplexing – TDM and FDM. [6]
7. **Applications of Communication**: Introduction to - Optical Fiber, Transmission line, Waveguides, Satellite communication and RADAR. [6]

Outcome: The learners are expected to have an overview of electronics and communication engineering and learn the introductory concepts in each of the specializations in ECE.

Text Books: George Kennedy, Bernard Davis, "Electronics Communication Systems", 3rd Edition, Tata McGraw-Hill, 2007.
Behrouz Forouzan, "Data Communication and Networking", 4th Edition, McGraw-Hill, 2006.
Robert L. Boylestad, Louis Nashelsky, "Electronics Devices and Circuits Theory", 10th Edition, Prentice Hall, 2009.

Reference Books: David A. Bell, "Electronics Devices and Circuits", PHI, 4th edition, 2008.
Wayne, Tomasi, "Advanced Electronic Communication Systems", 6th edition, PHI, 2013.

CS-14.101 **Programming Language** **Total Lectures: 40**
3-1-0-4

Objectives: Learning principle to program by a structured native language 'C'. Students will comprehend the rudiments, constructs, syntax and statements with essentials of efficient compiling, running and debugging processes.

1. **Introduction: T**he role of programming languages, programming paradigms, language description and syntax structure. Basics of structured programming, object oriented programming, functional programming, logic programming, concurrent programming. [10]
2. **Fundamentals of 'C' language :** Character set, Variables data types constants, arithmetic , relational and logical operators, type conversion , increment , decrement ,Bitwise and assignment operators, conditional expressions, statements and blocks, if-else , switch, Loops-Do-While , while, for; break, continue and Go to statements, Labels. [10]
3. **Functions, pointers and Arrays:** Basics of functions, automatic, external, static and register variables, scope rules and header files, recursion and C preprocessor, arrays, pointers and addresses, pointers and arrays address arithmetic, character pointers and functions, pointer arrays, pointers to functions, pointers and multidimensional arrays, command line arguments**.** [10]
4. **Structures, unions and file processing:** Basics of structures, structures and functions, arrays of structures, pointers to structures, self referential structures, unions, Bit fields, Concept of files, Standard Input and Output, formatted output, file access in different modes, reading from and writing into a file. [10]

Outcome: Students would be able to apply learning and knowledge of C language analytically, critically and logically to solve mathematical, scientific and real life problems in efficient manner.

Text Books: Brain W. Kernighan and Dennis M. Ritchie, "The C Programming Language," Second edition 2013, Pearson Education
Ravi Sethi & K.V.Viswanatha, "Programming Languages –Concepts and Constructs," Second edition 2013, Pearson Education

Reference Books: Herbert Schildt**, "**C: The Complete Reference," Fourth edition, McGraw-Hill Education, 2000

E Balagurusamy, "Programming in ANSI C," Tata McGraw - Hill Education

ME-14.111 **Computer Aided Engineering Drawing** **0-0-4-2**

Objective:
1. To improve the visualization skills.
2. To enable the students with various concepts like dimensioning, conventions and standards related to working drawings in order to become professionally efficient.
3. To impart the knowledge on understanding and drawing of simple engineering products.

1. **Introduction to Computer Aided Sketching:** Introduction, Drawing Instruments and their uses, BIS conventions, Lettering, Dimensioning and free hand practice. Board Drawing vs. Computer- Aided Drawing. Introduction to Solid works Environments. [8]
   Computer screen, layout of the software, standard tool bar/menus and description of most commonly used tool bars, navigational tools. Co-ordinate system and reference planes. Definitions of HP, VP, RPP &LPP. Creation of 2D/3D environment. Selection of drawing size and scale. Commands and creation of Lines, Co-ordinate points, axes, dimensioning, line conventions, material conventions and lettering.
2. **Orthographic Projections** : Horizontal planes, Vertical planes, Front view, Top view, Side view, Projections, First and Third angle of projection, Projections of points, Principles of orthographic projections, Sketching of different views of given objects. Introduction to sketching in Solid works : 2-Dimenional Sketching, Sketching in Solid works, poly-lines, square, rectangle, polygons, splines, circles, ellipse, text, move, copy, off-set, mirror, rotate, trim, extend, break, chamfer, fillet, curves, constraints viz. tangency, parallelism, inclination and perpendicularity. [12]
3. **Projections of Lines, Planes, Solids:** Lines inclined to both the principal planes, projection of Lamina inclined to both principal planes, Projections of solids: Axis inclined to both the reference planes and Intersection of solids. Introduction to part module in Solid works: Extrude, Revolve, Sweep, Hole, Filleting, and Chamfering features. [12]
4. **Sections of solids and sectional orthographic views:** Sectional orthographic projections - Full, Half, Partial, revolved and removed surfaces. Introduction to drawing module in Solid works: Standard 3 views, Auxiliary view, Section View, Projected view. [12]
5. **Isometric Projection:** Terminology, Isometric scale, Box method, Coordinate or offset method, Four-center method, isometric projection of arcs. Solid models practice using Solidworks part module. [8]

Outcomes:
1. Students will be able to improve their visualization skills so that they can apply these skills in developing new products.
2. Students will be able to know and understand the conventions and the methods of engineering drawing using Solid works.
3. Students will be able to prepare simple drawings of engineering products.

Text Books:
N.D. Bhatt, "Engineering Drawing", Charotar Publishing House, 2013.
Prof. Sham Tickoo, Sandeep Prem Dass “Solid works 2013 for Engineers and Designers” Wiley Publication, 2013.

Reference Books:
Randy H. Shih, “Solid works 2013 and Engineering Graphics: An Integrated Approach”, SDC Publications. 2013
David Planchard, "Engineering Graphics with Solid Works 2014 and Video Instruction", SDC Publications. 2013.

CS-14.111 **Programming Lab** **0-0-2-1**

1. **C- Language Basics**
    - 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.

2. **Control Statements**
    - 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.

3. **Functions**
    - 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.
4. **Arrays**
    - 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.
5. **Pointers**
    - 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.

6. **Structure and Union**
    - 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.
7. **I/O and File Structure**
    - 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.

PY-14.111 **Physics Lab** **0-0-2-1**

1. To study of material constant, temperature coefficient of current and planck's constant.

2. To determine the specific resistance of a given wire by using the Carey Foster's bridge

3. (a) To determine the ballistic constant, K of a moving coil ballistic galvanometer with a standard capacitor of known capacity.
(b) To determine the high resistance by the method of leakage of a condenser with the help of ballistic galvanometer.

4. To measures the wavelength of He-Ne laser beam with a Ruler or vernier calliper.

5. (a) To convert a galvanometer into a voltmeter of a given range.
(b) To convert a galvanometer into an ammeter of a given ranges.

6. To plot graph showing the variation of magnetic field with distance along the axis of a circular coil carrying current and to estimate from it the radius of the coil.

CY-14.111 **Chemistry Lab** **0-0-2-1**

1. To determine the Total, Temporary and permanent hardness of water by EDTA method.
2. To determine the % of available chlorine in a sample bleaching powder.
3. To determine the alkalinity of given water sample.
4. To prepare urea formaldehyde resin.
5. To determine the Calorific value of a fuel by bomb calorimeter.
6. Determination of the strength of HCl by titrating it against NaOH pH metrically.
7. Determination of the strength of HCl by titrating it against NaOH conductometrically.

ME-14.112 **Mechanical Workshop** **0-0-2-1**

List of Jobs:

1. Fitting Shop: Prepare job that contain various fitting operation like filing, marking, measuring, cutting, drilling etc.

2. Carpentry Shop: Making of carpentry joint (T, L joint etc).

3. Sheet Metal Shop: Making job from sheet (funnel, tray etc).

4. Machine Shop: Perform various operations like, turning, step turning, facing, chamfering, knurling etc on Lathe.

Text Books: Hajara Chaudhary, Workshop Technology vol I & II, Media Promoters and Publishers PVT. LTD, Mumbai.
B.S. Raghuvanshi, Workshop Technology, Dhanpat Rai & Sons. New Delhi.

Reference Books: H S Bawa, Workshop Technology, TMH. New Delhi.

EE-14.111 **EEE Lab** **0-0-2-1**

Practical to be performed on Hardware:

1. Introduction to basic electronics components and study of breadboard, CRO, function generator, multimeter and D.C. power supply.
2. To plot VI characteristics of junction diode and zener diode.
3. To design a half wave rectifier with and without filter circuit and find the ripple factor.
4. To design a full wave rectifier with and without filter circuitand find the ripple factor.
5. Study of clipper and clamper circuits and implement on breadboard.
6. To perform soldering and de-soldering to make banana probe, BNC probe and connection on PCB.
7. To conduct open circuit test and short circuit test on single phase transformer and to determine equivalent circuit parameters.
8. Measurement of three phase power by using two wattmeter methods.
9. Speed control of DC machine by field current control method.
10. To construct a fluorescent tube wiring and to measure voltage across tube rod, voltage across choke and current.

Practical to be performed using Multi-Sim Software:

1. An Introduction to Electronic Circuit Simulation using **Multi-Sim Software**.
2. To verify Ohm's law and Kirchhoff's law.
3. Simulate half wave and full wave bridge rectifier.
4. To plot VI characteristics of junction diode.

B. Tech. Electronics & Communication Engineering

Four Year B. Tech. Programme

Academic Curriculum (2016 - 17 onwards)

Common to B.Tech (ECE), MBA (ECE), BTMT (ECE – SP & VLSI base)

Second Year

CS -14.203 **Data Structures** **Total Lectures: 40**

Credit : 3-0-0-3

Prerequisite(s): CS-14.101, CS-14.111

Objective(s): To provide knowledge of ways of structuring and operating on data, the nature of some fundamental problems, methods for addressing those problems, and to promote an analytical and empirical appreciation of the behavior of algorithms using data structures.

1. **Introduction:** Basic Terminology, Elementary Data Organization, Algorithm, Efficiency of an Algorithm, Time and Space Complexity, Asymptotic Notations, Time-Space Trade- Off, Abstract Data Types. **[4]**
2. **Array:** Definition, Single and Multidimensional Arrays, Representation of Arrays: Row Major Order, and Column Major Order, Application of Arrays, Sparse Matrices and Their Representations. **[4]**
3. **Searching & Sorting:** Sequential Search, Binary Search, Comparison and Analysis, Hash Function, Collision Resolution Strategies, Insertion Sort, Selection Sort, Bubble Sort, Quick Sort, Merge Sort, Heap Sort, Radix Sort. **[6]**
4. **Linked list:** Singly Linked Lists, Doubly Linked List, Circular Linked List, Insertion, Deletion, Traversal, Polynomial Representation and Addition, Generalized Linked List. **[6]**
5. **Stack:** Primitive Stack Operations: Push and Pop Array and Linked List Implementation of Stack, Application of Stack: Prefix and Postfix Expressions, Evaluation of Postfix Expression, Recursion, Tower of Hanoi Problem. **[4]**
6. **Queue:** Queue Operations, Circular Queues, Array and Linked List Implementation of Queues, Dequeue and Priority Queue. **[4]**
7. **Tree:** Binary Trees, Binary Tree Representation, Tree Traversal Algorithms: Inorder, Preorder and Postorder, Threaded Binary Trees, Huffman Algorithm, Binary Search Trees AVL Trees. **[6]**
8. **Graph:** Terminology, Sequential and Linked Representations of Graphs: Adjacency Matrices, Adjacency List, Adjacency Multi List, Graph Traversal: Depth First Search and Breadth First Search, Spanning Trees. **[6]**

Outcome(s): Upon completion of the course the student should

- be knowledgeable of certain abstract data types (ADT).
- be able to make a critical assessment of different implementations of an ADT.
- be familiar with a number of fundamental computational problems, and be aware of real world instances of those problems.

2. Horowitz and Sahani, Fundamentals of Data Structures, Galgotia Publication, 1999.
3. Jean Paul Trembley and Paul G. Sorenson, An Introduction to Data Structures with applications, McGraw Hill, 2nd Edition, 2003.
4. G. A. V. Pai, Data Structures and Algorithms, TMH, 2008.

EC-14.201 **Electronic Devices and Circuits** **Total Lectures: 40**
3-1-0-4

Objective To acquire fundamental knowledge of operation, design and application of various Electronic devices and circuits.

Prerequisite Basic Electronics and Physics of electron.

1. **Junction Diode:** Junction breakdown**,** Current components in a p-n diode, Quantitative analysis of p-n diode characteristics and equivalent circuit, diode resistance, interconnections of diodes, transition and diffusion capacitance. [6]

2. **Transistors**: Operation of transistor, transistor current components, transistor circuit configurations, transistor biasing schemes and operating point stabilization, hybrid-pi model of BJT, low and high frequency models of JFET, MOS Devices - NMOS, PMOS and CMOS [11]

3. **Small Signal Amplifiers at Low Frequency:** Coupling schemes for multistage amplifiers, frequency response of coupled amplifier, RC coupled transistor amplifier, transformer coupled transistor amplifier, cascode circuits, Differential amplifier, Darlington amplifier. [7]

4. **Power Amplifiers:** Power amplifier circuits, class-A, class-B, class-AB, class-C, push pull amplifiers- class-A, class-B, Class- AB, complementary symmetry push-pull and quasi-complementary symmetry, push-pull amplifiers. [8]

5. **Oscillators:** Classification criterion for oscillation, tuned collector, Hartley, Colpitts, RC phase shift, Wien bridge and crystal oscillators, astable, monostable and bistable multivibrators, Schmitt trigger [8]

Outcome: After completion of this course, students would be able to understand the working phenomena and applications of various electronic devices and circuits. Knowledge gained from this course would also be utilized to design different electronic circuits and devices.

Text Books:
1. Millman J. & Halkias C.C., "Electronic Devices and Circuits" McGraw Hill.
2. Thomas L. Floyd, "Electronic Devices", Pearson Education.
3. Robert L. Boylestad & Louis Nashelsky, "Electronic Devices and Circuit Theory", Pearson Education.

Reference Book: Bell, David A., "Operational Amplifiers & Linear ICS" Prentice Hall of India.

EC-14.203 **Digital Electronics** **Total Lectures: 40**
3-1-0-4

Objective: The aim of this course is to present the principles and techniques of combinational and sequential digital logic design and optimization at a gate level. The use of transistors for building gates is also introduced.

Pre-requisite: Basic Electronics course in First Year.

1 **Number Systems and Codes:** Introduction to number systems, weighted and non-weighted codes, 1's complement, 2's complement, complement arithmetic. [2]

2 **Introduction to Boolean Algebra:** Postulates and theorems of Boolean algebra, Boolean functions, canonical and standard form, simplification of Boolean function using Boolean laws and theorems. [2]

3 **Logic Gates:** Diode and transistor as a switch, basic logic gates, derived logic gates, block diagrams and truth tables, logic diagrams from Boolean expression and vice versa, converting logic diagram to universal logic, positive logic, negative logic and mixed logic. [5]

4 **Simplification of Boolean Functions:** K-map representation, incompletely specified functions, simplification realization with gates, Quine-McCluskey method. [5]

5 **Combinational Logic:** Analysis and design of combinational circuits, half adder and full adder, half subtractor and full subtractor, binary serial and parallel adder, BCD adder, binary multipliers, magnitude comparator, decoders, encoders, multiplexers, de-multiplexers. [10]

6 **Sequential Circuits:** Latches, flip-flops, triggering of the flip-flops, master-slave flip-flop, excitation tables, conversion of the flip-flops, analysis and design of clocked sequential circuits, shift registers, counters. [10]

7 **Logic Families:** Logic gate characteristics (propagation delay, speed, noise margin, fan-in, fan-out, power dissipation), standard logic families (RTL, DCTL, TTL, ECL, MOS) [5]

8 **Programmable Logic:** Introduction to programmable logic array (PLA), programmable array logic (PAL). [1]

Outcome: Graduates will have knowledge of digital systems. They will understand how to analyze and design digital logic circuits, and be familiar with digital ICs.

3. Jain, R. P., “Modern Digital Electronics”, Tata McGraw-Hill, Patel Nagar, New Delhi, 4th Ed.

EE-14.201 Network Analysis & Synthesis Total Lectures: 40
3-1-0-4

Objective: This course helps in analysis of A.C & D.C circuits and it also help to design the circuit models for the minor and major projects.

Prerequisite: Knowledge of Laplace transformation

1. **Development of Circuit Concept:** Introduction, capacitance, inductance and resistance parameters, approximation of a physical system as a circuit, reference directions for current and voltage, voltage and current sources, active element conventions, dot convention for coupled circuits, topological description of networks, linear graphs of a network and its parts, loops and trees, incidence matrix, cut-set matrix and tie-set matrix. [8]
2. **Network Equations**: Kirchhoff's laws, minimum number of network equations, source transformations, formulation of network equations, loop variable analysis & node variable analysis and duality. [6]
3. **Analysis of RLC Circuits**: Laplace transformation, some basic theorems for the Laplace transformation, transient response of RL, RC and RLC circuits using Laplace transform with D.C input and A.C. with sinusoidal input, partial fraction expansion, solution of problems by Laplace transformation. [8]
4. **Network Theorems**: Superposition and reciprocity theorems, Thevenin's and Norton's theorems, Millman's theorem, Tellegen's theorem, and maximum power transfer theorem, application of these theorems to networks with a.c and d.c excitation. [8]
5. **Two Port Network**: Two port parameters, impedance, admittance, hybrid, inverse hybrid, transmission parameters, relationship between various parameters, reciprocity and symmetry of two port network, inter connection of two port networks. [6]
6. **Synthesis of Passive Network**: Hurwitz polynomials, positive real functions, elementary synthesis procedures, properties of LC immittance function, synthesis of LC driving point immittance, properties of RC driving point impedances, synthesis of RC impedances or RL admittances, properties of RL impedances and RC admittances, synthesis of RLC functions. [6]

Course outcome: Upon successful completion of this course, students should be able to:

1. Gain fundamental knowledge of the basic electrical elements such as resistance, capacitors and inductances.
2. Understand circuit representation as graphs and implementation of KVL and KCL in the circuits and to solve the circuit problems by Laplace transformation method and also by applying various networks theorems.
3. Analyze small RLC circuits by hand. Use network techniques, like node analysis and loop analysis, to write equations for large linear circuits.
4. Apply Thevenin and Norton theorems and concept of linearity and superposition to analyze and design circuits and networks.

Text Books

1. M. E. Van Valkenberg, "Introduction to Modern Network Synthesis", John Wiley and Sons, Inc., 1960.
2. A. Chakrabarti, "Circuit Theory – Analysis and Synthesis", Dhanpat Rai & Co., 2001. International Editions, 1993.
3. A. Sudhakar and S. P. Shyam Mohan, "Circuits and Network Analysis and Synthesis", Tata McGraw-Hill, 2007.
4. W. H. Hyatt Jr. and J. E. Kemmerly, "Engineering Circuits Analysis", McGraw-Hill.

MA 14.201 **Applied Mathematics** **Total Lecture: 40**
3-1-0-4

Objective: To acquire fundamental knowledge of linear programming, numerical methods, complex analysis and integral transform and apply in engineering disciplines.

1. Linear Programming: Introduction**,** Graphical method (bounded & unbounded solutions); Simplex method, Artificial variable technique (Two phase method, Big –M method); Assignment problem (Hungarian method); Transportation problem (Vogel's approximation method). **[12]**

2. Numerical Methods: Solution of system of equations (Gauss elimination and Gauss - Seidel methods); Solution of algebraic and transcendental equations (Bisection, Ramanujan's and Regula Falsi methods); Solution of ordinary differential equation (Euler's modified, Milne's predictor & corrector Runge-Kutta methods). **[10]**

3. Complex Analysis: Function of complex variable, analytic function, Cauchy- Riemann equations(without proof), integration of complex functions, line integrals in the complex plane, Cauchy integral theorem(without proof), Cauchy integral formula(without proof), zeros and singularities of complex functions, residues. **[06]**

4. Integral Transform: Laplace transform and inverse Laplace transform First and Second Shifting theorems, Convolution theorem (without proof), Solution of ordinary differential equations with initial conditions by Laplace transforms. Fourier series of periodic functions, even and odd functions, Fourier half-range series; Basics of Fourier transforms. **[12]**

Outcome: After completion of the course, students would be able to apply the knowledge of linear programming , numerical methods ,complex analysis and integral transforms in engineering
and solve curriculum problems.

EC-14.221 Electronics Devices and Circuit Laboratory 0-0-2-1

Objective To acquire fundamental knowledge of operation, design and application of various Electronic devices and circuits by doing the experiments.

Prerequisite Electronic Workshop

1. To plot the diode characteristics and its dynamic resistance and cut-in Voltage.
2. Plot the characteristics of a Zener diode and find its dynamic resistance under reverse biased condition. Plot the Line-Regulation and Load-Regulation curve using Zener diode.
3. (a) To implement a diode clipper circuit which clips the positive peak of the input voltage (i) By 1V and (ii) By 3V. (For given sinusoidal input $V_{pp} = 4V, 1kH$).
   (b) To implement a diode clipper circuit which clips the negative peak of the input voltage (i)By 1.5V and (ii)By 2.5V.(For given sinusoidal input $V_{pp} = 4V, 1kH$).
4. (a) To implement a diode clamper circuit which clamps the positive peak of the input voltage to(i)zero reference voltage and (ii)a given voltage $1V$. (For given square wave input $V_{pp} = 10V, 1kH$).
   (b) To implement a diode clamper circuit which clamps the negative peak of the input voltage to(i)zero reference voltage and (ii)a given voltage 1.5V.(For given square wave input $V_{pp} = 10V, 1kH$.
5. To plot the frequency response of a emitter follower.(For given sinusoidal input $V_{pp} = 3V, 1kH$.
6. Design a Half Wave Rectifier circuit with and without capacitor filter, measure the rms and Dc values of output voltage and calculate the ripple factor for given sinusoidal input $V_{pp} = 10V, 1kH$.
7. To plot the input and output characteristics of a transistor in CE Configuration.
8. Design a two stage RC coupled transistor amplifier and calculate the gain.(for given sinusoidal input $V_{pp} = 200mV, 1kHz$).
9. To plot the characteristics of a UJT and find its peak voltage, peak current and valley voltage. Design a relaxation oscillator determine the frequency of oscillation and compare the practical frequency obtained with the theoretical frequency.
10. To plot the Transfer characteristics (for$V_{DS} = 5V$)and Drain (for $V_{GS} = -1V$) characteristics of a JFET in CS Configuration.

Outcome:

After completion of this lab course, students would be able to demonstrate the working phenomena and applications of various electronic devices and circuits. Knowledge gained from this course would also be utilized to design different electronic circuits and devices.

Reference Book: Lab Manual and supported books referred in theory.

EC-14.223 **Digital Electronics Laboratory** **0-0-2-1**

Objective: This lab course develops skills for implementing and analyzing digital electronic circuits, with applications to electronics design. It is also designed to enhance problem solving ability through steadily increasing problem complexity.

Pre-requisite: Digital Electronics (EC 14.203)

1 To study the use of General Purpose Digital Trainer and familiarization with the digital IC Data-Books.

2 To study AND, OR. NOT, NAND, NOR, EX-OR gates and their specified experiments.

3 To set up a 4-bit Binary Counter (74LS93) to demonstrate its sequence of Counting.

4 To study the characteristics curve of TTL and CMOS logic gates.

5 To design and test 4-bit Adder and Subtractor circuits.

6 To compare the magnitude of two 4-bit Binary Numbers A and B.

7 Design a combinational circuit with 4 inputs and 4-outputs that converts a 4-bit Gray Code to an equivalent 4-bit Binary number.

8 Design and implement a BCD to Seven Segment Decoder / Driver.

9 To design and implement a 2 to 1 multiplexer.

10 To design and implement a 1:2 & 1:4 de multiplexer.

11 To investigate the operation of various flip flops SR, JK, T and D using gates and FF ICs.

12 To study the following application of shift register using IC 74LS164 and 74LS194 (Shift Right Logic, Shift Left Logic, Parallel Load).

13 Design and test arithmetic and logic circuit using combinational circuit (logic circuit, multiplexer and 4-bit binary adder/ full adder. (Already covered in experiment no.6, 10 &11)

14 Design and test a 4-bit Up Down binary counter. (Already covered in experiment no.3)

Outcome:

1. The background provided in this laboratory may effectively be utilized for the understanding of advanced courses such as VLSI Design and for the designing of complex circuitry.
2. Gain a hands-on experience in carrying out key operations needed to assemble circuits on breadboard.
3. This subject is directly applicable to industrial IC design and provides a strong background for more advanced courses.
4. This lab will be useful in the designing of hardware projects.

Reference Books:

1. Krishnamurthy, K. A., "Digital Lab Primer", Pearson Education, Patparganj, Delhi, First Indian Print, 2003.

2. TTL ICs Data Book

EE-14.221 Network Analysis & Synthesis Laboratory 0-0-2-1

Objective This Lab course helps us to gain basic knowledge of principle, operation, application and design/verification of various Electrical components /devices/ circuits/theorems by conducting the experiments.

Prerequisite EEE Workshop

1. To study the series and parallel connected resistive circuits.

2 To study the equivalent star of a delta connected resistive circuit and also the equivalent delta of a star connected resistive circuit.

3. To verify the Kirchhoff's current Law and Kirchhoff's Voltage law.

4 To verify the superposition theorem using resistive circuit.

5. To verify the Reciprocity Theorem using resistive circuit.

6. To verify the Thevenin's Theorem using resistive circuit
7. To verify of Norton's Theorem using resistive circuit.
8. To verify of Maximum Power Transfer Theorem using resistive circuit.
9. To determine Z-parameter, Y-parameter and ABCD parameter of a given Two-port network
10 To design a zero PCB for a given circuit to verify the Thevenin's Theorem
11 To find out the time- constant of RL-series circuit when connected to step function.
12 To find out the time constant of RC-series circuit when connected to step function.

Outcome:

After completion of this lab course, students would be able to demonstrate the working phenomena and applications of various electrical components and circuits. Knowledge gained from this course would also be utilized in designing different electrical circuits/theorems and devices.

1. Lab Manual

EC-14.202 Microprocessor Programming and Interfacing Total Lectures: 40
3-0-0-3

Objective: To develop an in-depth understanding of the operation of microprocessors and microcontrollers, machine language programming & interfacing techniques.

Pre-requisite: The students should have good background on digital circuits (should have attended the course Switching Circuits and Logic Design).

1. **The Microcomputer:** Evolution of microprocessor, address bus and data bus, introduction to machine language and assembly language, logic devices for interfacing: 74244, 74245, 74373 **[3]**
2. **The 8085 Processor:** Architecture, pin diagram and description of various signals, read, write and op-code fetch cycles, interrupt structure, instruction set and Assembly language programming. [12]
3. **The 8086 Microprocessor Architecture :** Architecture, details of sub-blocks such as EU, BIU; memory segmentation and physical address computations, pin diagram and description of various signals, minimum and maximum mode of operations, supporting chips viz. 8284, 8288 and memory mapping [8]
4. **Programming of 8086:** Addressing modes of 8086, instruction set of 8086, assembly language programming, counters and time delays, stack structure of 8086 and subroutine. [7]
5. **Interfacing of 8085 / 8086 with Programmable Chips:** Interfacing of 8255 Programmable peripheral interface, 8251 USART, 8253/8254 Programmable Interval Timer and Direct Memory Access Controller 8237/8257 DMA, 8259 Programmable Interrupt Controller. [10]

Outcome: **Upon completion of this course, the student will be able to:**

1. The student will learn the internal organization of some popular microprocessors and microcontrollers.
2. The student will learn hardware and software interaction and integration.
3. The students will learn the design of microprocessors/microcontrollers-based systems.

Text Books:

1. Ramesh S. Gaonkar, Microprocessor Architecture, Programming and Application with the 8085; Penram International Publishing (India).
2. A. K. Ray & K. M. Bhurchandi, Advanced Microprocessors and Peripherals; TMH.

Reference Books:

1. D. V. Hall, Microprocessors and Interfacings; TMH, second Edition.
2. B. P. Singh and Renu Singh, Advanced Microprocessors and Microcontrollers; New Age International Publishers, Third Edition.A. K. Ray & K. M. Bhurchandi, Advanced Microprocessors and Peripherals; TMH.

EC-14.204 **Integrated Circuit and Applications** **Total Lectures: 40**

3-1-0-4

Objective: To acquire fundamental knowledge of Mathematics and apply in engineering disciplines.

Pre-requisite: EC-14.201(Electronics Devices and Circuits)

1. **Differential Amplifier:** Operational amplifier, bipolar and FET differential amplifiers, constant current source, current mirror, level translator, block diagram of operational amplifier, frequency response and stability, operational amplifier parameters, offset compensation techniques. **[6]**
2. **Application of Op-amp:** Inverting and non-inverting amplifiers, voltage follower, integrator and differentiator circuits, instrumentation amplifier, current to voltage converter and voltage to current converter, voltage to frequency conversion, analog simulation of differential equations using operational amplifiers. **[7]**
3. **Oscillators:** Phase shift, Wein bridge, quadrature, square wave, triangular wave, sawtooth wave and voltage controlled oscillator. **[5]**
4. **Active Filters:** Low pass, high pass, band pass and band reject filters, designing of second order filters using Butterworth approximations, higher order filters and state variable filters. **[6]**
5. **ICs and Applications:** Clipping and clamping circuits, comparator, LM-311 comparator, schmitt trigger, log and antilog amplifiers, half and full wave rectification, IC-8038, IC LF-398, IC-555. **[6]**
6. **Voltage Regulator and PLL:** Voltage regulator IC-723, switching regulators, regulator IC series 78xx, 79xx, building blocks of PLL, IC-565 and its applications, four-quadrant multiplier and its applications. **[10]**

Outcome: After completion of the course, students would be able to apply mathematical knowledge in engineering and solve curriculum problems.

Text Books:

1. Gayakwad R. A., "Op-Amps and Linear Integrated Circuits", PHI, New Delhi, 3rd Edition.
2. Singh B. P. and Singh Rekha, "Electronic Devices and Integrated Circuits", Pearson Education, Patparganj, Delhi.
3. Coughlin R. F. and Driscoll F. F., "Operational Amplifiers & Integrated Circuits", Pearson Education, Patparganj, Delhi.

Reference Books:

1. Franco S., "Design with Operational Amplifiers and Analog Integrated Circuits", Pearson Education, Patparganj, Delhi.

EC-14.206 **Consumer Electronics** **Total Lectures: 40**

3-1-0-4

Objective: This subject will introduce the students with working principles, block diagram and advance features of consumer electronics appliances. Also this will familiarize students with latest advancements in Electronic manufacturing industry. Knowledge so gained would also help in troubleshooting and maintaining different electronic gadgets and appliances.

Pre-requisite: Basic understanding of electric circuits and components and some knowledge of basic electronic devices such as diodes, transistors etc.

1. **Introduction to Electronics Engineering:** Review of basic electrical & electronic circuits and components. Difference in electrical and electronic engineering. Introduction to electronics industry in India and the world; consumer electronics gadgets classification and applications. Introduction to ESDM (Electronic System Design & Manufacturing). **[4]**
2. **Audio devices and systems:** Characteristics of sound signal: level and loudness, pitch, frequency response, fidelity and linearity, Reverberation. Audio level metering, decibel level in acoustic measurement. Microphone: working principle, sensitivity, response. Loud speaker: working principle, characteristic impedance, and watt capacity, loud speaker types. Sound recording: Optical recording, stereophony. Audio system: CD player, home theatre sound system. Digital console: block diagram, working principle, applications. FM tuner: concepts of digital tuning, ICs used in FM tuner TDA 7021T. PA system: planning, speaker impedance matching, Characteristics, power amplifier. **[12]**
3. **Television and Video Systems:** Monochrome TV standards, scanning process, aspect ratio, persistence of vision and flicker, picture resolution. Composite video signal: horizontal and vertical sync details. Colour TV standards, colour theory, hue, brightness, saturation, luminance and chrominance. PAL system, channel bandwidth. Digital TVs: - LCD, LED, PLASMA, HDTV, 3-D TV, projection TV, DTH receiver. CD and DVD player: working principles. **[10]**
4. **Home and Office Appliances:** FAX and Photocopier Microwave Oven: types, technical specifications Washing Machine: wiring diagram, electronic controller for washing machine, technical specifications, types of washing machine, fuzzy logic Air conditioner and Refrigerators: Components features, applications and technical specification. Digital camera and cam coder. **[10]**
5. **Advanced trends in Electronic manufacturing industry:** Basics of semiconductor technology and integrated circuits. Introduction to embedded intelligence in electronic gadgets: microcontroller based systems; different ICs used in the systems such as 8051, Op-Amp, 555 timer, and Digital ICs. **[4]**

Outcome: After the completion of the course, students are able to acquire required learning outcomes in cognitive, psychomotor and affective domains to demonstrate the following course outcomes:

i. Troubleshoot different types of microphones, audio systems and colour TV receiver.
ii. Maintain various electronic home appliances.

Text Books:

1. Audio video systems : principle practices & troubleshooting ; Bali R. and Bali S.P. ; Khanna Book Publishing Co. (P) Ltd. , 2010
2. Consumer Electronics; S.P. Bali ; Pearson Education India, 2010
3. Audio video systems ; Gupta R. G. ; Tata Mc Graw Hill, New Delhi, 2010
4. Colour Television & Video Technology; A. K. Maini ; CSB Publishers

Reference Books:

EC-14.208 **Principles of Electromagnetics** Total Lectures: 40

3-0-0-3

Objective: To develop the understanding of basics concepts of electromagnetic field theory and its applications.

Pre-requisite: Basic understanding of laws of Physics and Mathematics

1. **Introduction**: Transformation of a point and a vector in different coordinate systems, Differential length, area, volume Physical meaning of gradient, divergence and curl, Laplacian of a scalar, Divergence theorem, Stoke's theorem, review of electrostatic and magneto static fields. [8]
2. **Time Varying Fields and Maxwell's Equations:** Faraday's law of electromagnetic induction, Maxwell's equations in integral and differential form, potential functions, electromagnetic boundary conditions. [8]
3. **Electromagnetic Waves:** Introduction, Helmholtz wave equation, Wave equations and their solutions for free space, lossy dielectric, Lossless dielectrics and good conductor medium, Poynting vector and the flow of power. Reflection of plane wave at dielectric media and conducting surfaces for normal incidence. [10]
4. **Transmission lines:** Types of transmission lines, transmission line parameters, two conductor transmission line equations, input impedance, standing wave ratio and power of transmission lines, smith chart, transmission line impedance matching techniques. [6]
5. **Guiding Structures:** General wave behaviors along uniform guiding structure, rectangular and circular wave guides, wave propagation in rectangular and cylindrical cavity resonators. [8]

Outcome: After completion of this course, students would be understanding the concept of electric and magnetic fields, both static and dynamic, and gain insight in various application areas like transmission lines and waveguides.

Text Books:

1 Matthew N. O. Sadiku, Principles of Electromagnetics (Fourth Edition); Oxford University Press.

2 William H. Hayt: Engineering Electromagnetic, TMH.

3 Raju, Electromagnetic field theory and Transmission lines, Pearson Education.

4 John D. Kraus: Electromagnetics, McGraw Hill.

Reference Books:

2 M. L. Sisodia and G. S. Raghuvanshi, Microwave Circuits and Passive Devices, New Age Publication.

MA 14.202 **Statistics and Probability Theory** **3-1-0-4**

Total Lecture: 40

Prerequisite: Basic Mathematics

Objective: To acquire fundamental knowledge of Statistics and Probability and apply in engineering disciplines.

1 Introductory Ideas: Recapitulation of Basic Probability theory; Law of addition and law of multiplication ;conditional probability; total probability; Bayes' theorem and it's applications. [06]

2 Random Variables and Distribution: Discrete and continuous random variables; types of distribution; probability mass and density functions; mean, variance and standard deviation of distribution. [04]

3 Theoretical Probability Distribution: Discrete types (Binomial) and Continuous type (Normal,Students'); applications of basic ideas to these distributions. [08]

4 Sampling Theory: Sampling distribution of mean and variance; central limit Theorem. [04]

5 Testing of Hypothesis: Simple and Composite hypothesis; Type I and Type II errors; tests of significance and level of significance. [04]

6 Correlation and Regression: Simple, partial and multiple correlations; linear regression. [06]

7 Queuing Theory and Queuing Models: Birth and death process; pure birth and pure death process; Classification of queuing models: M/M/1, M/M/1/N, M/M/S and M/M/S/N. [08]

Outcome: After completion of the course, students would be able to apply the knowledge of Statistics and Probability in engineering and solve curriculum problems.

Text Books:

EC-14.222 Microprocessors Programming and Interfacing Laboratory 0-0-2-1

Objective: To introduce to students the basics of 8086 microprocessor, assembling language programming and interfacing with various modules.

Pre-requisite:

In this laboratory the students are expected to learn to apply their theoretical knowledge of both the hardware and software aspects of microprocessors. Programming of the device is done in assembly language. Some of the experiments that follow the construction project deal with software while others deal with the problems of interfacing of microprocessors.

1 [a] Write a program for 8085 microprocessor to move a eight bit number in register A, B, C and D. Verify the content of all the registers after execution of program.
Also find out the followings:

(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

[b] Load a eight bit number stored in memory location 4000H into register A. Now load the content of A in B and in memory location 5000H. Verify the contents of A, B and memory location 5000H.

Also find out the followings:

(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

2 Write a assembly language program to add two eight bit numbers stored in memory and store the 8 LSBs and 8 MSBs of sixteen bit result at 2000H and 2001 respectively. Verify the content of flag register after addition.
Also find out the followings:

(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

3 [a] Write a program to perform multiplication of two 8 bit numbers using 8085 microprocessor.
Also find out the followings:

(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

[b] Let two numbers are stored at memory locations 2000H and 2001H. Write a program for 8085 microprocessor to perform following actions:
If 1^{st} number > 2^{nd} number then store 00H at 3000
If 1^{st} number < 2^{nd} number then store FFH at 3000
If 1^{st} number = 2^{nd} number then store 99H at 3000
Also find out the followings:

(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

4 [a] Write a program for 8086 microprocessor to transfer a series of five eight bit number stored from

memory location 2000:2000 to new memory location 3000: 3000.

Also find out the followings:

(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

[b] Write a program for 8086 microprocessor to transfer a series of five sixteen bit number stored from memory location 2000:2000 to new memory location 3000: 3000.

Also find out the followings:

(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

5 **[a]** Write an assembly language program for 8086 microprocessor to find out the smallest number from a series of five eight bit numbers and store it at memory location 2000H: 2000H.

Also find out the followings:

(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

[b] Write an assembly language program for 8086 microprocessor to find out the largest number from a series of five eight bit numbers and store it at memory location 2000H: 2000H.

Also find out the followings:

(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

6 Create a look-up table from memory location 2000H: 1000H to store square of numbers from 00 to 09. Write an assembly language program for 8086 microprocessor to find out the square of a number stored at 2000H: 100AH and store the result at 2000H: 100BH.

Also find out the followings:

(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

7 **[a]** Write a program to arrange the series of four eight bit numbers in ascending order.

Also find out the followings:

(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

[b] Write a program to arrange the series of four eight bit numbers in descending order.

Also find out the followings:

(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

8 Interface three LEDs with 8086 Kit to form traffic light control logic.

Also find out the followings:

(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

9 Interface a buzzer with 8086 microprocessor with the help of relay and write a program to control the ON-OFF sound from the buzzer. Also find out the followings:

(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

10 Interface a DC motor with 8086 microprocessor and write a program to control its operation.

Also find out the followings:

(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

Laboratory Assignment: Assembly and Machine Language Programming, Signal Generators, Interfacing Basic I/O devices like Keypad, LED display, Usage of Timers & USART Peripherals.

Outcome: **After the basic knowledge of microprocessor and microcontroller interfacing and their applications, the student will be able to:**

- Analyze and apply working of 8086.
- Compare the various interface techniques. Analyze and apply the working of 8255, 8279, 8259, 8251, 8257 ICs and design and develop the programs.
- Learning the Communication Standards.

EC-14.224 Integrated Circuit & Applications Laboratory 0-0-2-1

Objective: This lab course develops skills for implementing and analyzing electronic circuits, with applications to electronics design. It is also designed to enhance problem solving ability through steadily increasing problem complexity.

Pre-requisite: Integrated Circuits & Applications (EC 14.204)

Experiments to be performed on breadboard

1. To measure the following parameters of IC-741-
(a) Slew rate (b) CMRR

2. Implement the circuits to show the application of op-amp as-
(a) Summing amplifier (inverting)
(b) Difference amplifier (c) Algebraic adder

3. (a) Design an ideal inverting integrator to integrate a square wave of frequency, f $\geq$ 1KHz.
(b) Design a non-ideal non-inverting differentiator to differentiate a triangular wave of frequency, f $\geq$ 1KHz.

4. To plot the frequency response of -
(a) 1^{st} order Low-Pass active filter
(b) 1^{st} order High-Pass active filter

5. Design a second order band pass filter with cut off frequencies 200Hz and 1kHz and a gain of 4db. Plot its frequency response and hence find the Q of this filter.

6. Design the following circuit using IC 555 timer-
(a) Monostable Multivibrator to generate a pulse of 0.11 ms.
(b) Astable Multivibrator with 50% duty cycle.

7. Design op-amp based circuits to realize Wein Bridge oscillator.

8. To study application of IC 555 as-
(a) VCO (b) Schmitt-trigger circuit for square wave generator

9. To measure free running frequency, lock range and capture range of the given PLL circuit using IC-565.

10. Verify the line regulation and load regulation using IC 723.

Experiments to be performed on MultiSim software

1. Design and verify the operation of non-inverting amplifier.

2. Design an ideal inverting differentiator to differentiate a triangular wave of frequency, f $\geq$ 1KHz.

3. Design a non–ideal inverting integrator to integrate a square wave of frequency, f $\geq$ 1KHz.

4. Design Op-amp based circuits to realize Phase Shift Oscillator.

5. Implementation of Bistable Multivibrator using 555 timer.

6. To determine the frequency and output amplitude of a triangular wave generator.

Outcomes:

1. Gain a hands-on experience in carrying out key operations needed to assemble circuits on breadboard.
2. This subject is directly applicable to industrial IC design and provides a strong background for more advanced courses.
3. This lab will be useful in the designing of hardware projects.

Reference Book: Gayakwad R. A., "Op-Amps and Linear Integrated Circuits", PHI, New Delhi, 3rd Edition.

EC-14.210 **Comprehensive I** **Total Lectures: 40**
0-0-0-3

Objective To acquire intensive knowledge and proficiency in some special field of knowledge.

Prerequisite Basic concepts of all prior program related courses such as, principles of semiconducting materials and devices, digital logic systems and theories of circuits and networks.

1. Comparative study of BJT and MOS transistors in respect of operation, circuit configuration, biasing stability, high and low frequency models, small-signal amplifiers and oscillator design issues.
2. Boolean function implementation using logic gates, comparative studies of RTL, DTL, TTL and ECL logic families in respect of speed, noise and power dissipation, logic function design based on PLA and PAL.
3. Application of Laplace transformation to network equations, steady-state and transient response of low-pass, high-pass and band-pass networks, hybrid and transmission parameters of two-port networks, RL, RC, and RLC network synthesis.

Outcome: After completion of this course, students would be able to understand the principles of entire field of major subjects till the second year of study.

CS-14.202

Java Programming

Total Lectures: 40

Credit : 3-0-0-3

Prerequisites: CS14.101, CS-14.205.

Objectives: The objective of this Course is to:

- Cover issues related to the definition, creation and usage of classes, objects and methods. Become comfortable with object-oriented programming and learn to think in terms of objects.
- Discuss the principles of inheritance and polymorphism. The concepts would be demonstrated through problem analysis assignments.
- Provide the foundation of good programming skills by discussing key issues of the design of object-oriented software, including programming design patterns and documentation.
- Cover the basics of APIs as well as allow students to explore the Java Abstract Programming Interface.

5. **Overview:** Introductionto java, importance of Java, interactive development environments: Eclipse/Net Beans, basics of OOP. **[4]**
6. **Data Types, Variable, and Arrays:** primitive data types, type casting,arrays, operators and control structures. Identifiers, constants and literals. **[6]**
7. **Classes and Objects:** Class fundamentals, declaring objects, assigning object referencevariables, introducing methods, constructors, the this keyword, garbage collection, the finalize() method, overloading methods, using objects as parameters and return type, introducing access control, understanding static, introducing final, introducing nested and inner classes, exploring the string class, using command-line arguments. **[9]**
8. **Inheritance:** Inheritance basics, using super, multilevel hierarchy, constructor in hierarchy, method overriding, dynamic method dispatch, using abstract classes, using final in inheritance, the object class. **[4]**
9. **Package, Interfaces and Exception Handling:** Packages, access protection, importing packages, interfaces, exception-handling fundamentals, exception types, using try and catch, multiple catch clauses, nested try statements, throw, throws, finally, Java's built-in exceptions, user defined exception. **[6]**
10. **Multithreaded Programming:** The Java thread model, the main thread, creating multiple threads, thread priorities, managing threads, Thread class built-in functions **[4]**
11. **I/O and String Handling:** I/O basics, reading console input, writingconsole output, the Print Writer class, reading and writing files, string constructors, operations on String, String tokenizing, String Buffer **[7]**

Outcomes: Upon completion of this course, students are able to:

- Understand the concepts of OOP as well as the purpose and usage principles of inheritance, polymorphism, encapsulation and method overloading.
- Identify classes, objects, members of a class and the relationships among them needed for a specific problem.
- Develop programs using the in-built Java API and the Java standard class library.
- Create Java application programs using sound OOP

practices(e.g.,interfacesandAPIs)and proper program structuring (e.g., by using access control identifies, automatic documentation through comments, error exception handling).

- Use of development environment like Eclipse for collaborative programming/editing.

Text Books:

1. Java The Complete Reference, 8th Edition. By Herbert Schildt.
2. Mastering Java 2 By John Jukowski.

Reference Books:

1. Think Java "How to Think Like a Computer Scientist", By Allen B. Downey.
2. Java How To Program (Early Objects), 10th Edition, ByPaul Deitel,Harvey Deitel.

EC-14.301 **Signal Processing and Applications** **Total Lectures: 40**

3 – 1 – 0 - 4

Objective:

- To understand the fundamental characteristics of continuous- and discrete-time signals and systems in terms of both the time and transform domains and to develop the mathematical skills to solve problems involving convolution and sampling.
- The students would be familiar with different methods in DSP, including digital filter design, transform-domain processing and importance of Signal Processors. The course emphasizes intuitive understanding and practical implementations of the theoretical concepts.

Pre-requisite: None

1. **Representation and classification of Signals**: Signal classification - Continuous and discrete time, Periodic - aperiodic, even - odd, energy - power, Deterministic - random, real valued - complex exponential, sinusoidal, time scaling, time shifting, Sampling and discrete time processing of continuous-time signals, Concept of frequency in continuous-time and discrete-time signals. **[06]**
2. **Basics of Systems and Transformation**: Properties of systems – linearity, time invariant, causal, stable, inverse, static and dynamic, system impulse response, convolution, correlation, Transformation - Fourier series, continuous time and discrete time Fourier transform, Laplace transform, z-transform, its properties, limitations and inverse transforms, pole – zero concept, computation of impulse response and transfer function using transforms. **[06]**
3. **Analysis of Continuous time and discrete time systems:** Block diagram representation, linear time-invariant (LTI) systems, interconnection of LTI Systems, discrete time systems and their types, systems with finite and infinite duration impulse response, recursive and non-recursive structures, system realizations in direct , transpose, cascade and parallel forms. **[08]**
4. **DFT, FFT and DCT Algorithms:** Discrete Fourier transform (DFT), linear convolution using DFT, efficient computation of the DFT - Fast Fourier transform (FFT) algorithms, radix-2 & 4 FFT algorithms, discrete cosine transform (DCT) - DCT-1 and DCT-2, energy compaction property of DCT. **[06]**
5. **Digital Filter Design:** Review of analog filters – comb and notch types, Design of infinite Impulse Response (IIR) filter from analog filters - Bilinear and Impulse invariant transformation, Finite Impulse Response (FIR) filter - amplitude & phase responses, linear phase filters, transversal filters, windowing techniques, comparison between IIR and FIR filters. **[08]**
6. **Applications of signal processing:** DTMF signal detection, spectral analysis of deterministic and random signals, musical sound processing, signal compression and radar application. **[06]**

Outcome: After completion of the course, students will be able to

- Understand the process of sampling and spectral characteristics of periodic and aperiodic signals using Fourier analysis and determine the response of LTI system using Fourier analysis convolution.
- Understand the meaning and implications of the properties of signals and systems, and represent discrete-time signals analytically and visualize them in the time domain.
- Understand the Transform domain and its significance and problems related to computational complexity.
- Design discrete time filters, compute different errors in design process.

Text Books:

1. Signals and Systems - A.V. Oppenheim, A.S. Willsky and S.H. Nawab, PHI, 2nd Edition.
2. Signals and Systems – Tarun Kumar Rawat, Oxford Higher Education, 2010
3. Digital Signal Processing – A Computer Based Approach, S. K. Mitra, 3rd Ed, McGraw-Hill.

4. Principles of Signal Processing and linear systems – B. P. Lathi, Oxford

Reference Books:

1. Fundamentals of Signals and Systems Michel J. Robert, MGH International Edition, 2008.
2. Digital Signal Processing, Principles, Algorithms, and Applications: John G. Proakis, Dimitris G. Manolakis. Pearson Education, PHI - 2007

EC-14.303 **Principles of Analog Communication** **Total Lectures: 40**

3-1-0-4

Objective:

- To develop a fundamental understanding on communication systems with emphasis on analog modulation techniques.
- To appreciate the mathematical concepts that form the foundations of analog communication

Pre-requisite: Signals and Systems, Statistics and Probability Theory

1. **Linear Modulation Techniques:** Basic blocks of communication systems, Review of signals and systems, Linear Modulation, Time domain and frequency domain description of AM (DSB-FC), DSB-SC, SSB and VSB signals. Generation and detection of linear modulation techniques, Super-heterodyne receivers and design. **[12]**
2. **Angular Modulation Techniques:** Basic concepts, Frequency Modulation Spectrum Analysis of FM Wave, Generation and detection of narrow band and wide band frequency modulation, Phase modulation, FM detection techniques-phase locked loops, Commercial broadcasting systems. **[8]**
3. **Sources of Noise and their characterization:** Random Variables, Random process and their characterization. Noise in Analog communication System. SNR calculations for synchronous detection of DSB and SSB and envelope detection of AM, SNR calculations for angle modulation system. Pre-emphasis and de-emphasis. Threshold effect in angle modulation. **[8]**
4. **Multiplexing and Multiple Access Techniques:** Frequency division Multiplexing, time division multiplexing, multiple access techniques. **[5]**
5. **Sampling and Pulse Modulation:** Sampling theorem – ideal and natural sampling and reconstruction, Pulse-Amplitude Modulation, Pulse-Time Modulation. **[7]**

Outcome:

1) Apply the basic knowledge of signals and systems and understand the basics of communication system and analog modulation techniques.
2) Evaluate the communication system performance in the presence of noise and summarize the merits and demerits of all the conventional analog modulation system.
3) Understand the basics of different of multiplexing and multiple access techniques and their application in cellular networks.
4) Understand the fundamentals of digital transmission of analog signals.
5) Design as well as conduct experiments, analyze and interpret the results to provide valid conclusions for modulators, demodulator and communication systems using CAD tool.

Text Books:

1) B P Lathi, Zhi Ding, Modern Digital and Analog Communication Systems, Oxford university press, 4th Edition.
2) P. K. Ghosh, Principles of Analog and Digital Communication, Orient Black Swan Publishers Pvt. Ltd., 1st Edition
3) Taub and Schilling, Principles of Communication Systems, TMH.
4) E. Ziemer William H. Tranter, Principles of Communication, John Wiley & Sons 5th Edition.

1) S. Haykins, Communication Systems (4/e), Wiley.
2) *Kennedy, Davis, Electronic Communication Systems (4/e), McGraw Hill.*

EE-14.204 Electrical Measurement and Instrumentation Total Lectures: 40
3-0-0-3

Objective: To make students conversant with concepts of measurement and various electrical and electronics instruments, transducers and bridges.

Pre-requisite: Basic Electrical engineering, Basic Electronics engineering

1 **Concepts of Measurements:** Introduction, accuracy and precision, repeatability, errors in measurement, sources of errors, types of errors, statistical analysis of measurement data, graphical representation of measurement, data as distributions, Gaussian graph and precision indices. [6]

2 **Analog Instruments:** Types of operating torques in an analog instrument, Moving coil, moving iron, electrodynamic and induction instruments-construction, operation, torque equation and errors. Shunts and multipliers. Applications of instruments for measurement of single-phase power and single-phase energy. Errors in wattmeter and energy meter and their compensation and adjustment. [6]

3 **Bridge:** DC bridges for measurement of resistance Wheatstone bridges, Kelvin's double bridges and AC bridges for measurement of L, R, C & M, Maxwell's bridges, Anderson's bridges, Weins bridges. [6]

4 **Electronic Instruments for Measuring Basic Parameters:** Electronic Voltmeter, Electronic Multimeters, Digital Voltmeter, Q meter, Vector Impedance meter, signal analyzers- wave analyzers, harmonic distortion analyzers and spectrum analyzers. [6]

5 **Potentiometers:** DC and AC potentiometers, Principles, Standardization and application. [5]

6 **Transducers:** Introduction , Classification, Selection Criteria, Characteristics, Construction, Working Principles and applications of following Transducers- RTD, Thermocouples, Thermistors, LVDT, RVDT, Strain Gauges, Tachogenerators, Piezoelectric Transducers, Ultrasonic Flow Meters. [6]

7 **Oscilloscopes:** CRT Construction, Basic CRO circuits, CRO Probes, Oscilloscope Techniques of Measurement of frequency, Phase Angle and Time Delay. [5]

Outcome: Students will be able to understand electrical and electronic measuring devices and instrumentation like bridges, transducers, CRO etc.

EC 16.305 **Semiconductor Physics** **Total Lectures: 40**

3-1-0-4

Course Objective

The aim of the course is to develop physics and engineering strategies of semiconductor materials and to discuss their functionalities in modern electronic and optoelectronic devices.

Prerequisites : Basic Modern physics , Optics

1	Introduction to solid state materials - crystal structure - Reciprocal lattice - Brillouin zone and rules for band (*k* - space) representation. Dynamics of electrons in periodic potential: Kronig - Penny and nearly free electron models - Real methods for band structure calculations; Bandgaps in semiconductors - Holes and effective mass concept - Properties of conduction and valance bands.	[8]
2	Fermi distribution and energy - Density of states - Valance and conduction band density of states - intrinsic carrier concentration - intrinsic Fermi level. Extrinsic semiconductors: n and p type doping - Densities of carriers in extrinsic semiconductors and their temperature dependence - extrinsic semiconductor Fermi energy level - Degenerate and non - degenerate semiconductors - Bandgap Engineering.	[8]
3	Scattering Mechanism: electron - electron and electron - phonon scattering. Macroscopic transport: Carrier transport by Diffusion - Carrier transport by Drift: Low field, High field and very high field (Impact ionization) - Einstein relation.	[8]
4	Electron - hole pair generation and recombination: band to band (direct and indirect band gap transitions) and intra band (impurity related) transitions, free - carrier & phonon transitions. Excitons : Origin, electronic levels and properties Radiative and nonradiative recombination (Shockley - Read - Hall and Auger) processes. Carrier transport - continuity equations. Optical constants: Kramers - Kronig relations.	[8]
5	Optical processes in semiconductor, choice of materials for LED, LED power and efficiency, LED structures - Planar LED, Dome LED, Surface Emitting LED, Edge Emitting LED, Optical detection principle, quantum efficiency, Photoconductor, p-n photodiode, p-i-n photodioe, APD, Heterojunction diode, optocouplers.	[8]

Course Outcome

This course will provide the students with a basic understanding of the physics and principles of semiconductor material and the operation of the most important semiconductor devices in modern microelectronics and photonics.

Text Books:

1. "The Physics of Semiconductors" by Kevin F Brennan, Cambridge Univ. Press (1999).
2. "Fundamentals of Semiconductors" by Peter Y Yu and Manuel Cardona, Spriger, (1996).
3. "Introduction to Solid State Physics" by Charles Kittel, 6th Ed., Willey (1991).

Reference Books

4. "Semiconductor Physics and Devices" by D.A. Neamen, 3rd Ed.,Tata McGraw-Hill, (2002).
5. "Physics of Semiconductor Devices" S.M. Sze, John Willey, 2nd Ed., (1981).
6. "Semiconductor Optoelectronics (Physics and Technology)", Jasprit Singh, McGraw-hill, (1995).

EC-14.321 **Digital Signal Processing Lab** **0-0-2-1**

Objective: The lab aims to introduce the mathematical approach to manipulate discrete time signals, which are useful to learn digital tele-communication.

Pre-requisite: Signals and Systems

1. **Using the MATLAB**

i) Generation of the basic signals such as unit impulse, unit step, unit ramp, exponential, sine and cosine etc.
ii) Study of linear convolution
iii) Study of impulse response of the causal LTI System
iv) Study of DFT
v) Study of circular convolution
vi) Study of FIR filter response
vii) Study of IIR filter response
vii) Study of FFT

2. **Using the TMS320C67XX Processor**

i) Wave generation
ii) Linear Convolution
iii) Circular Convolution
iv) DFT
v) Impulse Response of systems

Outcome: Analyze discrete-time systems in both time & transform domain and also through pole-zero placement.
Analyze discrete-time signals and systems using DFT and FFT
Design and implement digital finite impulse response (FIR) filters.
Design and implement digital infinite impulse response (IIR) filters.

\

Text Books:

1. Digital Signal Processing – S. K. Mitra (McGraw-Hill)
2. J. G. Proakisetal, Digital Signal Processing, (4/e) Pearson, 2007.

Reference Books:

1. Signals and Systems-Simon Haykin, Bary Van Veen-Wiley Eastern
2. A.V. Oppenheim & R.W. Schafer, "Discrete Time Signal processing", (2/e), Pearson Education, 2003.

EC-14.323 Analog Communication Laboratory 0-0-2-1

Objective: The educational objectives of the EC-14.323 (Analog Communication Lab)course are:

- Graduates who desire to pursue an engineering career in Communication arena will be widely employed in positions they find appropriate and desirable.
- Graduates who desire to pursue higher degrees will be successful in gaining admission and advancing in programs they find appropriate and desirable.

Pre-requisite: EC-14.206

1. To Generate an AM signal and measure the depth of modulation using a CRO.
2. Implement an AM Modulator and demodulator circuits and verify its waveform and calculate its modulation index.
3. Implement FM generator circuit and observe variation with modulating signal.
4. Implement a circuit of Pulse Width Modulator with IC-555.
5. Implement a circuit of Pulse Width Modulator with IC-741.
6. Implement a circuit to show the application of IC-555 as Pulse Position Modulator.
7. To observe the effect of pre-emphasis and de-emphasis on given input signal.
8. Implement the PLL circuit to find its capture range and lock range.
9. Study of Time Division Multiplexing and demultiplexing (TDM- PAM) (ST 2102)
10. To understand the AM Signal modulation and demodulation. (MULTISIM)
11. To understand double side band AM modulation technique. (MULTISIM)
12. To analyze the modulation index and power of an AM signal. (MULTISIM)
13. To understand the FM Modulation and detection. (MULTISIM)
14. Study of sampling theorem, construction and reconstruction and see the aliasing effect. (ST 2101)
15. Project based on communication techniques

Outcome:

- Ability to apply knowledge of mathematics, basic science, and engineering to solve problems encompassing fundamental areas of Analog Communication.
- Ability to apply in-depth knowledge of Communication principles, systems, and devices to the solution of real time problems.
- Ability to design and evaluate a component or system to meet desired needs within the field of Communication systems.

Text Books:

1. B. P. Lathi, "Modern Digital and Analog communication Systems", Oxford University Press, 2010.
2. P. K. Ghosh, Principles of Analog and Digital Communication, Orient Black Swan Publishers Pvt. Ltd.

Reference Books:

1. Simon Haykin, An Introduction to Analog and Digital Communication; John Wiley & Sons
2. Taub and Schilling, Principles of Communication Systems, TMH

EC 15.311 **Telecommunication Switching Systems** **Total Lectures: 40**

3-0-0-3

Objectives:

1. To acquire knowledge on simple telephone communication and basics of switching system.
2. To get acquainted with electromechanical switching systems.
3. To gain knowledge on digital switching systems, stored program control system, traffic engineering, telephone networks and ISDN.
4. To apply the knowledge of Telecommunication Switching in designing switching systems.

Prerequisite: NONE

1. **Introduction to Switching Systems:** Introduction, simple telephone communication, basics of switching system [4]
2. **Electromechanical Switching Systems: Introduction to Strowger switching system,** Crossbar switching systems, single stage and multistage switching systems, common control, pulse dialling, tone dialling. [6]
3. **Digital Switching Systems:** Stored Program Control, centralised SPC, distributed SPC, software architecture, application software, space division, and time division switching, time multiplexed space division, time multiplexed time division switching and combination switching. [10]
4. **Traffic Engineering:** Erlang's equation, blocking probability and B-D equation. [4]
5. **Telephone Networks:** Subscriber loop, digital subscriber loop, high speed digital transmission over subscriber line, wire-in, wire-less media, coaxial cables, optical fibre cables, microwave propagation, satellite transmission, numbering plan, charging plan, Inchannel signalling, common channel signalling. [10]
6. **ISDN and ATM Standards:** ISDN architecture, channels, interfaces, protocol, B-ISDN architecture, frame relay, ATM protocols [6]

Outcomes: Once the student has successfully completed this course, he/she will be able to answer the following questions or perform following activities:

1. Able to explain the basic concepts of telecommunication Switching Systems.
2. Able to describe different mechanical and electronic switching systems, telephone networks.

Able to design various switching systems.

Text Books:

1. Telecommunication Switching Systems and Networks, Thiagarajan Viswanathan, PHI
2. Telecommunication Switching, Traffic and Networks, J. E. Flood, Pearson Education

EC-15.313	System Design Using HDL	Total Lectures: 40
		3-0-0-3

Objective: To acquire fundamental knowledge of designing of digital systems using VHDL.Students will acquire practical working knowledge of creating digital circuits using commercial Computer-Aided-Design (CAD) tools.

Pre-requisite: Knowledge of digital logic and digital circuits are highly desired.

1. **Programmable Logic Design:** ASIC, ROM, PLA, PAL, CPLD and FPGA. **[3]**

2. **VHDL Based Design:** An overview of VHDL, Role of VHDL in system design, Introduction to CAD tools for system design, Introduction to Xilinx IDE software. **[3]**

3. **VHDL Fundamentals:** Entity and architecture declaration, Introduction to behavioral, dataflow and structural models, package, package declarations and package body. **[6]**

4. **Basic Elements of VHDL:** Data objects – constant, variable and signal, Data types – scalar and composite, Predefined Operators – logical, relational, shift, adding and multiplying, Overloading – literal and operator. **[4]**

5. **VHDL Statements:** Process,variable assignment, signal assignment, sequential statements, conditional statements, loop**,** if, case, next statements, assertion and report statements, signal drivers and signal assignment statements, conditional signal assignments, select and generic. **[10]**
   Subprograms: Application of functions and procedures, Overloading and signal assignments, Component declaration, Component instantiation.

6. **Combinational Circuit Design:** VHDL models of combinational circuits such as Adder, Multiplexer, De-multiplexer, Encoder, Decoder, Code converters, Comparators, Parity generators, Multipliers and implementation of Boolean functions. **[7]**

7. **Sequential Circuit Design:** VHDL Models of sequential such as edge triggered D flip flop, T flip flop and J K flip flop, serial in serial out register, serial in parallel out register, parallel in parallel out register, counter, memory, ALU. **[7]**

Outcome: After completion of the course, students would be able to:

- Identify, formulate, and solve engineering problems
- To use the technique, skills, and modern engineering tools necessary for engineering practice.

Text Books:

1. J. Bhaskar, VHDL Primer, Pearson Education Asia, 3rd Ed.
2. Douglas L. Perry, VHDL Programming by Examples, Tata McGraw Hill, 4th Ed.
3. Yogesh Misra, Digital System Design Using VHDL, Dhanpat Rai & Co., 1st Ed.

EC 15.315 **BASICS OF ROBOTICS** **Credit : 3-0-0-3**
Total Lectures: 40

• To introduce the basic concepts, parts of robots and types of robots.
• To make the student familiar with the various drive systems for robot, sensors and their applications in robots.

Prerequisite: Nil

Unit I- Introduction **[8]**

Robot anatomy-Definition, law of robotics, History and Terminology of Robotics-Accuracy and repeatability of Robotics-Simple problems- Specifications of Robot-Speed of Robot-Robot joints and links-Robot classifications-Architecture of robotic systems-Robot Drive systems- Hydraulic, Pneumatic and Electric system.

Unit Ii - End Effectors And Robot Controls **[8]**

Mechanical grippers-Slider crank mechanism, Screw type, Rotary actuators, cam type-Magnetic grippers-Vacuum grippers-Air operated grippers-Gripper force analysis-Gripper design-Simple problems-Robot controls-Point to point control, Continuous path control, Intelligent robot-Control system for robot joint-Control actions-Feedback devices-Encoder, Resolver, LVDT-Motion Interpolations-Adaptive control.

Unit Iii-Robot Transformations And Sensors **[8]**

Robot kinematics-Types- 2D, 3D Transformation-Scaling, Rotation, Translation- Homogeneous coordinates, multiple transformation-Simple problems. Sensors in robot – Touch sensors-Tactile sensor – Proximity and range sensors – Robotic vision sensor-Force sensor-Light sensors, Pressure sensors.

Unit Iv-Robot Cell Design And Applications **[8]**

Robot work cell design and control-Sequence control, Operator interface, Safety monitoring devices in Robot-Mobile robot working principle, actuation using MATLAB, NXT Software Introductions-Robot applications- Material handling, Machine loading and unloading, assembly, Inspection, Welding, Spray painting and undersea robot.

Unit V-Micro/Nano Robotics System **[8]**

Micro/ Nanorobotics system overview-Scaling effect-Top down and bottom up approach-Actuators of Micro/Nano robotics system-Nanorobot communication techniques-Fabrication of micro/nano grippers-Wall climbing micro robot working principles-Biomimetic robot-Swarm robot-Nanorobot in targeted drug delivery system.

Outcomes: The Student must be able to understand the basics of Robot.

Text Books:

1. Niku Saeed B., Introduction to Robotics: Analysis, Systems, Applications, PHI, New Delhi 2001
2. John J.Craig, “Introduction to Robotics”, Pearson, 2009.

Reference Books:

1. Richard D Klafter, Thomas A Chmielewski, Michael Negin, "Robotics Engineering – An Integrated Approach", Eastern Economy Edition, Prentice Hall of India Pvt. Ltd., 2006.

EC-14.302 **Microwave Engineering** **Total Lectures: 40**

3-0-0-3

Objective: To acquire fundamental knowledge of Microwave and apply in engineering applications.

Pre-requisite: Electromagnetic Field Theory.

1. **Introduction:** **[03]**
   Microwaves, Generation: Brief idea of microwave tubes and microwave solid state devices, properties and applications.

2. **Microwave Circuits:** **[07]**
   Equivalent voltage and current definition in waveguides, concept of impedance, impedance matrix, admittance matrix, scattering matrix and transmission matrix**.**

3. **Microwave Passive Devices:** **[10]**
   Excitation of waveguides through probes, loops and apertures. Terminations: matched loads and short, attenuators, phase shifters, two hole directional coupler, E-plane tee, H-plane tee, magic tee, microwave propagation in ferrites, isolators and circulators.

4. **Microwave Active Devices:** **[14]**
   Reflex Klystron, Two cavity Klystron, Travelling Wave Tubes, Magnetrons, Gyrotron, construction, operation and practical applications of Gunn diode, Tunnel diode and IMPATT diode**.**

5. **Microwave Measurements:** **[06]**
   Detection of microwaves, measurement of microwave power, impedance, frequency, VSWR, Q-factor and scattering parameters.

Outcome: After completion of the course, students would be able to apply microwave concepts and equations in engineering and solve voltage and current equations.

Text Books:

1. David M. Pozar, Microwave Engineering (Third Edition), John Willey & sons.
2. Samuel Y. Liao, Microwave devices and Circuits (Third Edition), Pearson Education.
3. Annapurna Das &Sisir K Das, Microwave Engineering (Second Edition), McGraw-Hill Companies.

Reference Book:

1. Matthew N. O. Sadiku, Principles of Electromagnetics (Fourth Edition), Oxford University Press

EC-14.304 **Principles of Digital Communication** **Total Lectures: 40**
3-1-0-4

Objective: The objective of this course is to introduce the students to the basic concepts of digital communication. The aim of this course is to study the fundamental aspects of digital communication systems. The understanding of the fundamentals of digital communication by studying theory, numerical and implementation of circuits.

Pre-requisite: The basics of Communication Systems and Techniques.

1. **Model of a Communication System:** Introduction, advantages of digital communication over analog communication, probability theory random process and random variables. **[6]**
2. **Digital Communication Techniques:** Sampling theorem and techniques, uniform and non-uniform quantization techniques, PCM, DPCM, DM, and ADM, compression standards, time division multiplexing and synchronization, Digital multiplexing hierarchy, Electrical representation of binary sequences Bandwidth requirement of PCM. **[10]**
3. **Information Theory and Coding:** Channel capacity, Shannon capacity, source entropy, Shannon-Fano, Huffman coding, linear block codes and syndrome decoding, cyclic codes, BCH codes, convolution, Viterbi coding and decoding. **[10]**
4. **Digital Modulation Techniques:** Base-band transmission, inter-symbol interference and adaptive equalization, digital modulation and demodulation techniques, bandwidth consideration of different digital modulation schemes, matched filter and probability of error analysis, carrier and timing recovery techniques. **[14]**

Outcome:

- The students can understand the concepts of digital communication.
- They acquire and apply the knowledge to implement the concepts for designing an efficient communication system.
- They become able to identify, analyse and implement new ideas in digital communication systems for proposing alternate solutions.

Text Books:

1. B. P. Lathi, "Modern Digital and Analog communication Systems", Oxford University Press, 2010.
2. P. K. Ghosh, Principles of Analog and Digital Communication, Orient Black Swan Publishers Pvt. Ltd., 1st Edition
3. H. Taub, D L Schilling, Goutom Saha, "Principles of Communication", TMH.

Reference Books:

1. Simon Haykin, "Communication Systems", Wiley India.
2. H P HSU and D Mitra, "Analog and Digital Communications", TMH
3. John G. Proakis, "Digital Communications", McGraw-Hill International.

EC-14.306 Microcontroller and Embedded Systems Total Lectures: 40
3-0-0-3

Objective: The objective of this course is to teach students design and interfacing of microcontroller-based embedded systems. The course covers fundamentals, The 8051 Architecture, Assembly Language Programming, Instruction set, Serial Communication and Interfacing techniques of 8051 Microcontroller.

Pre-requisite: Programming skills and fundamental knowledge of microcontrollers, microprocessors and digital design.

1. **Introduction to Microcontrollers, Architecture and Memory Interfacing:** Overview of the 8051 family, 8051 Microcontroller's Architecture, Pin configuration, Common memory types and Tradeoffs, External Memory interfacing. **[7]**
2. **Programming of 8051:** Addressing modes of 8051, instruction set of 8051, assembly language programming of 8051, stack structure of 8085, delays, and subroutines, Applications of interrupts, timer/counter and serial port, Components of Integrated Development Environment for software development. **[16]**
3. **Interfacing of 8051:** Interfacing of 8051 with sensors, Keyboard, ADC, DAC, LCD, Stepper Motor and D.C motor. **[8]**
4. **Introduction to Embedded systems and processors:** Introduction and Examples of Embedded Systems, Concept of Embedded System. Design challenge, Processor technology, IC technology, Design technology, Trade-offs: Custom single purpose processor hardware, general-purpose processor: introduction, basic architecture, operation, super-scalar architecture, application specific instruction set processors, microcontrollers, digital signal processors, selection of embedded processor. **[6]**
5. **Software aspect of embedded system:** Challenges and issues in embedded software development, Software and hardware requirements, Real time system, Real time operating systems, Kernel, architecture: mutex, semaphore, testing and verification. **[3]**

Outcome: Upon completion of this course, the student will be able to:

1. Program, build and test a microcontroller system.
2. Interface a microcontroller system to user controls and other electronic systems.
3. Describe the internal architecture of microcontroller systems, including counters, timers, ports, and memory.
4. Understand and design embedded systems and real-time systems.
5. For real-time systems:
    - Identify the unique characteristics of real-time systems.
    - Explain the general structure of a real-time system.
    - Define the unique design problems and challenges of real-time systems.

Text Books:

1. M. A. Mazidi, The 8051 Microcontroller & Embedded Systems; Pearson Education.
2. I. Scott McKenzie and Raphael C.W. Phan; The 8051 Microcontroller; Pearson Education.
3. Raj Kamal, Embeded System; Tata Mcgraw-Hill.

Reference Books:

1. David E Simon, An Embedded Software Primer; Pearson Education.

EE-14.304 **Power Electronics** **Total Lectures: 40**

3-0-0-3

Objective:

- To introduce to students the theory and applications of power electronics systems for high efficiency, renewable and energy saving conversion systems
- To prepare students to know the characteristics of different power electronics switches, drivers and selection of components for different applications
- To develop students with an understanding of the switching behavior and design of power electronics circuits such as DC/DC, AC/DC, DC/AC and AC/AC converters

Prerequisite: Network Analysis, Basics of Electronics Engineering, Engineering Mathematics

1. **Introduction:** Review of power semiconductor devices, SCR, Static and dynamic characteristics, Turn-on and Turn-off methods and circuits, Ratings and protection of SCRs, Series and parallel operation of thyristor, Other members of thyristor family. [8]
2. **Phase Controlled Converters:** Principle of phase control, Single phase half wave circuit with different types of loads, Single phase and three phase semi converter and full converter bridge circuits, Single phase dual converters and their operation with circulating and non-circulating currents. [10]
3. **AC Voltage Controllers:** Types of single-phase voltage controllers, Single-phase voltage controller with R and RL type of loads, gate pulse requirements to trigger the SCRs of ac voltage controllers. [5]
4. **Cyclo-converters:** Principles of operation, Single phase to single phase step up and step down cycloconverters. Three phase to single phase cycloconverter. [5]
5. **DC Choppers:** Principle of chopper operation, Control strategies, Types of choppers, Step up and step down choppers, Types of choppers and operations. [5]
6. **Inverters:** Single phase VSI: half bridge and full bridge inverters and their steady state analysis, Series and parallel inverters, three phase bridge inverters with 180 degree and 120 degree modes of operation. Current source inverters, CSI with R load (qualitative approach). [7]

Outcome:

- The student will be able to understand the principle of operation of commonly employed powerelectronic converters
- The student will be capable of analyzing non-linear circuits with several power electronic switches
- The student will be equipped to take up advanced courses in Power Electronics and its application areas

Text Books:

1. Rashid, M., Power Electronics, Prentice Hall of India Private Limited (2006).
2. P. S. Bimbhra, Power Electronics, Khanna publishers.

Reference Books:

1. Mohan, N., Undel, T. M. and Robbins, W. P., Power Electronics: Converter Applications and Design, John Wiley and Sons (2007).

2. Jain, A., Power Electronics and its Applications, Penram International Publishing (India) Pvt. Ltd. (2008)
3. Dubey, G. K., Doradla, S. R., Joshi, A. and Sinha, R. N. K., Thyristorised Power Controllers, New Age International (P) Limited, Publishers (2004).

RM 17.101 **Research Methodology** **2-0-0-2**

1	**Introduction:** Meaning of research, Objectives, Motivation for Research, Types of Research, Research Approaches, Research Process, Validity and Reliability in Research.	[2]
2	**Problem Formulation:** Identification, Selection and Formulation of a Research Problem, Criteria of a good Research Problem, Review of Literature.	[2]
3.	**Research Design:** Research Framework, Meaning & Significance of Research Designs, Features of a good Research Design, Types of Research Design.	[4]
4.	**Data for research:** Types of Data, Sources of Data, Methods of Collecting Data, Data Presentation Techniques. Methods of Data Analysis.	[6]
5.	**Data Analysis and Simulation Tool:** Introduction to SPSS, MATLAb, Network Simulators, ETAP, Solid Works, MultiSim.	[6]
6.	**Thesis Writing:** Contents, Referencing Styles, Ani Plagiarism Policy, Literature Review, Motivation, Objectives, research gap, Methodology, Research Deasin and Analysis, Results, Findings, Implications, Contributions, Significance of research, Scope for future work and conclusion.	[6]

EC-14.322 Microwave Engineering Laboratory

0-0-2-1

Objective: To acquire fundamental knowledge of Microwave active and passive devices as well as various parameters measuring with the microwave components.

Pre-requisite: EC 223 (Electronics Devices & Circuits Laboratory), EC 208 (Electromagnetic Field Theory)

1. To draw the mode characteristics of reflex klystron tube and determine it's electronic tuning range.
2. To determine the frequency and wavelength in a rectangular waveguide for dominant mode. Also verify the waveguide law.
3. To obtain the following for Gunn diode :-
   (A) V-I characteristics
   (B) Out power and frequency as a function of input voltage.
4. To measure the polar pattern, beam width and gain of following antennas :-
   (A) Pyramidal horn and pickup horn
   (B) Dielectric antenna
   (C) E-Plane
   (D) H-Plane
5. To determine following parameter of Isolator and Circulator :-
   (A) Insertion loss
   (B) Isolation
   (C) Input VSWR
6. To determine the following parameter of Magic Tee :-
   (A) Insertion loss
   (B) Isolation
   (C) Input VSWR
   (D) Coupling factor
7. To determine the following parameter of directional coupler :-
   (A) Insertion loss
   (B) Main line and auxiliary line VSWR
   (C) Coupling factor
   (D) Isolation
   (E) Directivity
8. To Calibrate the Phase shifter.
9. To Determine the standing wave ratio and reflection coefficient.
10. To Determine the impedance of unknown load with the help of smith chart.

.

Outcome: After completion of the course, students would be able to work with different active and passive devices. This course will be very beneficial for the graduates who wish to work in telecommunication industry and defense.

EC-14.324 Digital Communication Laboratory 0-0-2-1

Objective:

The objectives of the Digital Communication laboratory are:

a) To allow the students to perform experiments that demonstrate the theory of digital communication systems that will be discussed in the lecture course.
b) To introduce the students to some of the electronic components that make up digital communication systems.
c) To familiarize the students with proper laboratory procedure; this includes
    - Precise record-keeping.
    - Logical troubleshooting.
    - Safety measures.
    - Capabilities as well as limitations of measurement equipments.
d) To implement the circuits of analog modulation and demodulation on breadboard and verification of the results using CRO.
e) To implement the circuits of digital modulation and demodulation on breadboard and verification of the results using CRO.
f) To understand and practice the turning of a function generator, frequency, impedance, CRO for getting the desired results.
g) To implement the circuits/set-up of Transmission lines, Optical Fibre communication, Satellite communication and detection of the received signals by using LEDs, multimeters, speakers and CROs.
h) To study and implement BPABX(Electronic Private Automatic Branch Exchange).

Pre-requisite:

a) The basic knowledge of different electronic components like resistors, capacitors, transformers, LEDs and devices like CRO, Power Supply, Function Generator, Multimeters.
b) To operate and handle different devices like breadboard, experiment kits, CRO, Multimeter, Function Generator, Power Supply.
c) The knowledge of connecting cables and making connections using breadboard and experiment kits.
d) The familiarity with proper laboratory procedure and safety measures.
e) The conceptual and theoretical knowledge of the experiments to be performed.

Experiments:

1 To generate an AM signal and measure the depth of modulation using a CRO.

2 Study of PSK modulation and demodulation.

3 To generate a pulse Amplitude Modulation and Demodulation

4 (a)To generate a Pulse Width Modulation and demodulation.
(b)To generate Pulse Position Modulation and demodulation.

5 Measurement of Numerical Aperture of a Fiber Using Optical Fiber Trainer Kit & Measure the Bending Loss.

6 Study of FSK Modulation and demodulation

7 (a) To generate a PCM signal and demodulate it.
(b) To Study Parity error and hamming code.

8 (a) Measuring the input impedance of the transmission line.
(b) Measuring the attenuation of the transmission line.

9 Study of Time Division Multiplexing and de-multiplexing (TDM- PAM).

10 Study of Delta modulation and demodulation

11 Study of AM receiver and Transmitter

12 Study of optic fiber kits and setting the Analog & Digital link on the kits.

13 To generate the FM signal and demodulate it

14 To Understand the Basic concept of satellite communication
(a) Establish a direct communication link between Transmitter and receiver using Tone Signal.
(b) To Transmit and receive wave form (Sine wave) through satellite link.

15 To Study EPABX System and analyze various.

Outcome:

a) The student exhibits previously learned and performed experiments of analog communication by recalling them.
   - To generate an AM signal and measure the depth of modulation using a CRO.

b) They understand the basic facts and concepts of digital communication by performing experiments.
   - Study of FSK Modulation and Demodulation by implementing circuit using breadboard/kit and analyzing results using CRO.
   - To generate a PCM signal and demodulate it.
   - To generate a Pulse Width Modulation and demodulation.
   - To generate Pulse Position Modulation and demodulation by implementing circuit using breadboard/kit and analysing results using CRO.

c) They acquire and apply the knowledge to implement the concepts for designing an efficient communication system in laboratory using different devices.
   - To Establish a direct communication link between Transmitter and receiver using Tone Signal and effect of increasing and decreasing distance between the transmitter and receiver.

d) They become able to troubleshoot and identify the problems in circuit implementation.
   - The frequency tunning, impedance matching, wrong connections and malfunctioning of devices/Breadboards/Kits.

EC-14.326 Microcontroller and Embedded System Lab

0-0-2-1

Objective: To acquire the knowledge of software and hardware development, testing and debugging.

Pre-requisite: Fundamental knowledge of digital electronics, microcontrollers and programming concepts.

EXPERIMENT LIST

1.
a) Introduction to Keil µVision Integrated Design Environment software.
b) Write an ALP for 8051 to move a block of five bytes stored from locations 30H to 40H of internal RAM.

2.
a) Write an ALP for 8051 to move a block of five bytes stored from address 3000H of external data memory to address 40H of internal RAM.
b) Write an ALP for 8051 to move a block of five bytes stored from address 40H of internal RAM to address 3000H of external data memory.

3.
a) Three 8 bit numbers are stored at internal RAM locations 30H, 31H and 32H. Find out the largest number and store it at internal RAM location 40H.
b) Three 8 bit numbers are stored at internal RAM locations 30H, 31H and 32H. Find out the smallest number and store it at internal RAM location 40H.

4.
a) Introduction to Proteus software.
b) A switch 'S' is connected to P0.0 pin of 8051 controller. Develop the software and a prototype with the help of Proteus software for following operation:
(i) If 'S' = '0' then P1.0 = '0' and P1.1 = '1'
(ii) If 'S' = '1' then P1.0 = '1' and P1.1 = '0'

5. By assuming the reference temperature as 27°C develop the software and a prototype with the help of Proteus software to continuously read the present room temperature from port 1 and perform the following operations:
If (reference temperature) > (present room temperature) then P0.0 = '1'
If (reference temperature) < (present room temperature) then P0.1 = '1'
If (reference temperature) = (present room temperature) then P0.2 = '1'

6. Develop the software and a prototype on bread board for a traffic light algorithm.

7. Write a program to count ten objects on a conveyor belt, assuming that a sensor gives a pulse for every object moving on the conveyor belt. Generate a 'HIGH' signal at P1.0 pin for 5 seconds when all the objects are counted. Make suitable assumptions.

8. Develop the software and a prototype with the help of Proteus software for interfacing four push button type keys "1", "2", "3" and "4" with Port 0 of

8051 controller as one-dimensional array and a seven segment display with Port 1. The pressed key value should be displayed on seven segment display.

9. Write a program and develop a hardware prototype to toggle two LED's connected at P1.0 and P1.1 pins of 8051 with the help of interrupt.

10. A temperature sensor IC LM 35 is used to sense the temperature of a room. It is connected to an ADC and (Vref/2) pin of ADC is connected to 2 volts. A DAC is calibrated for 5 volts full scale output. A fan is connected to the DAC. Develop the hardware and software to meet the following specifications:

(i) If room temperature is ***'less than'*** 20°C then fan will be OFF.
(ii) If room temperature is ***'greater than or equal to'*** 20°C and ***'less than'*** 30°C then DAC will supply 2V to run the fan.
(iii) If room temperature is ***'greater than or equal to'*** 30°C then DAC will supply 4V to run the fan.

Outcome: After completion of the course, students would be able to develop the hardware and software required for an embedded system.

EC-15.312 Advance Radio Access Network (ARAN) Total Lectures: 40

3-0-0-3

Objective:
To acquire skills on different legacy and advance RAN's Architecture, Design & Optimization along with latest industries concepts on 5G, IOT, Volte, RAN Cloud etc.

Prerequisite:
Digital Modulation Techniques & Data Transmission, Antenna and Wave Propagation, Basics of Mobile Communication

1.	**Introduction to RAN:** Telecom E2E approach, RAN Life Cycle**,**RF basics, Microwave Theory, Propagation Models, Modulation Theory, Antenna Theory. Latest Industry Concepts – 5G, IOT, Volte, RAN Cloud	[4]
2.	**RAN Overview**:Introduction to Cellular Concepts, Introduction to Power Control, Introduction to Protocol Stacks, GSM, WCDMA, LTE (Overview, Architecture, Air Interface), Generalized Call Flows	[12]
3.	**RAN Design:**RF Design Overview, Initial Radio Network Design (Link Budget, Radio Network Dimensioning & Nominal Design), Final Radio Network Design, Radio Planning Tools & IBS Introduction, Radio Propagation Model Tuning, LRAN Initial Radio Network Design (Sample Report)	[12]
4.	**RAN Optimization:**Pre Launch Optimization (Process Overview, Introduction to Drive Testing (Data Collection Methodology, Data Post Processing),Post Launch Optimization, (Process Overview, Introduction to Counters and OSS, KPI Improvement Methodology)	[12]

Outcome: After completion of this course, students would be able to understand the industry level ways of working of RAN with different design and optimization techniques. Students will get heads up in terms of upcoming advance technologyconcepts.

Text Books:

1. Ericsson Academy (Ericsson Internal)
   - Air Interface
   - Protocol and Procedures
   - GSM, UMTS, LTE Fundamentals
   - RAN Design & Performance Management.
2. Andrea Goldsmith, "Wireless Communications", Cambridge University Press, 2007.
3. Theodore S. Rappaport, "Wireless Communication", Pearson Education, Asia, New Delhi, 2002.

Reference Books:

1. John G. Prokis and Masoud Salehi," Digital Communication", McGraw-Hill, Fifth edition.

EC 15.314 **FUNDAMENTALS OF MEMS** **Total Lectures: 40**
3-0-0-3

Objective: The objective of this course is to make students to gain basic knowledge on overview of MEMS (Micro electro Mechanical System) and various fabrication techniques. This enables them to design, analysis, fabrication and testing the MEMS based components.

Pre-requisite: Knowledge of materials and VLSI is highly desired.

1. **Introduction:** MEMS Roadmaps, Benefits of Miniaturization, Benefits of Scaling. **[2]**
2. **Fabrication Process:** oxidation, film deposition, lithography, etching, ion implantation, diffusion. **[8]**
3. **Micromachining:** Surface Micromachining: basic process flow, release, stiction, material choices, residual stress, stringers and planarization, MUMPS, Summit, electroplating, 3D out-of-plane. Bulk Micromachining: wet etch based, dissolved wafer process, SOI MEMS, Scream, Hexsil MEMS, sealed cavity deep RIE. **[6]**
4. **Process Integration:** interleaved, MEMS-first, MEMS-last, bonded integration, wafer-to-wafer transfer, fluidic assembly. **[4]**
5. **Mechanics of Materials for MEMS:** stress, strain, material properties, measurement & characterization of mechanical parameters. **[3]**
6. **Microstructural Elements:** bending moment and strain, flexural rigidity, residual stress, boundary conditions, spring combinations. **[3]**
7. **Energy Methods:** application to clamped-clamped beam under axial load, resonance frequency determination, free-free beam, disk, ring, lumped-element mechanical equivalent circuits. **[4]**
8. **Circuit Modeling of MEMS:** resonator equivalent circuits, thermal circuits, fluidic circuits. **[3]**
9. **Electronic and Mechanical Noise:** electronic noise sources, Brownian motion noise, circuit noise calculation procedure, SNR, dynamic range. **[3]**
10. **Micromechanical Circuits:** general filter topologies, insertion loss (noise figure), shape factor, design with k and q values, termination impedance, resonator and couplers, circuit modeling of coupled resonators, systematic micromechanical filter design procedure, oscillators, RF MEMS switches. **[4]**

Outcome: 1. Be familiar with the important concepts applicable to MEMS, their fabrication.
2. Be fluent with the design, analysis and testing of MEMS.
3. Apply the MEMS for different applications.

Text Books:

1. Senturia's "Microsystem Design"
2. Kovacs' "Micromachined Transducers Sourcebook"
3. Jaeger's "Introduction to Microelectronic Fabrication"
4. Chang Liu, "Foundations of MEMS", Pearson International Edition, 2006.

EC 15.316 ROBOTICS AND CONTROLS Total Lectures: 40
Credit : 3-0-0-3

OBJECTIVES:

- . To get exposure about basic robot kinematics, dynamics, control and programming.

Prerequisite: Basics of Robotics

UNIT I Introduction [4]

Definition, Structure, Classification and Specifications of Robots, Industrial Robots.

UNIT II Robot Elements and Control [4]

Manipulators, Drives, Sensors, End Effectors, Configuration, Force/Torque Relationship, Trajectory Planning, Position Control, Feedback System, Digital Control.

UNIT III Modeling of Robots [10]

Coordinate Frames, Mapping and Transformation; Direct Kinematic Model; Inverse Kinematics; Manipulator Differential Motion; Static Analysis; Jacobian.

UNIT IV Manipulator Dynamics [10]

Acceleration of a rigid body, mass distribution, Newtons equation, iterative Newton Euler dynamic formulation, Lagrangian formulation of manipulator dynamics, Bond graph modeling of manipulators, Trajectory Planning.

UNIT V Linear and Non Linear Control of Manipulators [12]

Control law partitioning, trajectory following control, multi input multi output control systems, Cartesian based control scheme. Force Control of manipulators: hybrid position/force control.

Outcomes: The Student must be able to design automatic manufacturing cells with robotic control using the principle behind robotic drive system, end effectors, sensor, machine vision robot kinematics and programming.

Text Books:

1. Fu K S, Gonzalez R C, Lee C.S.G, "Robotics: Control, Sensing, Vision and Intelligence", McGraw Hill, 1987.

3	EC-15.415	Robot Programming	Robotics

EC-14.401 **VLSI Design** **Total Lectures: 40**
3-1-0-4

Objective:	The educational objectives of the VLSI design course are:
1.	Graduates who desire to pursue an engineering career in VLSI Design arena will be widely employed in positions they find appropriate and desirable.
2.	Graduates who desire to pursue higher degrees will be successful in gaining mission and advancing in programs they find appropriate and desirable.
Pre-requisite:	EC-14.201 Electronics Devices and Circuits, EC-14.203 Digital Electronics.

1.	**Basic VLSI Design Issues:** IC design techniques- hierarchical design, design abstraction and computer-aided design	[4]
2.	**MOS Transistor Theory:** Current-voltage characteristics of MOSFETS, threshold voltage and body effect, MOSFET design equations, second order effects, MOSFET capacitances	[8]
3.	**NMOS and CMOS Inverter:** NMOS and CMOS inverters, W/L ratio for NMOS and CMOS inverters, β_n/β_p ratio, noise margin, NMOS and CMOS Voltage transfer Characteristics, CMOS delay and power dissipation	[8]
4.	**MOS Inverter's Switching Characteristics:** Calculation of delay times, Inverter design with delay constraints	[6]
5.	**Stick Diagram & Layout:** Stick diagrams, CMOS design style, design rules: lambda based design rules, layout design	[8]
6.	**Basic VLSI Circuit Design Techniques:** Inverter equivalent of series and parallel MOS circuits, logic design with delay and power constraints, worst case design, complex logic design	[6]

Outcomes:

- Ability to apply knowledge of mathematics, basic science, and engineering to solve problems encompassing fundamental areas of VLSI design.
- Ability to apply in-depth knowledge of VLSI design principles, systems, and devices to the solution of real time problems.
- Ability to design and evaluate a component or system to meet desired needs within the field of VLSI design.
- Ability to function as a member of a multidisciplinary team in the solution of engineering problems such as providing CAD solution for device fabrications.

Text Books:

1. Douglas A. Pucknell & Kamran Eshraghian, Basic VLSI Design, PHI, 3rd Ed., 2011
2. Neil H.E. Weste, David Harris, Ayan Banerjee, CMOS VLSI Design, A Circuits and Systems Perspective, Pearson Education, 4th Ed., 2011
3. Sung-Mo Kang, Yusuf Leblebici, CMOS Digital Integrated Circuits Analysis and Design, Tata Mc-Graw-Hill, 3rd Ed., 2003

Reference Books:

1. Jab M. Rabaey, Anantha Chandra Kasan, Borivoje Nikolic, Digital Integrated Circuits - A Design Perspective, PHI, 2nd Ed., 2012
2. Michal John Sebastian Smith, Application-Specific Integrated Circuits, Pearson Education, 6th Ed., 2009

EC-14. 403 **Antenna and Wave Propagation** **Total Lectures: 40**

3-0-0-3

Objective: To impart knowledge on basics of antenna theory and to analyze and design a start of art antenna for wireless communications and RADAR.

Pre-requisite: EC-14.208 Principles of Electromagnetics

1. **Introduction**: Basic properties of transmitting, and receiving antenna, gain, bandwidth, and polarization, Effective aperture and Friss transmission formula. [4]
2. **Physical Concept of Radiation:** Retarded potentials hertzian dipole, antenna parameters, radiation pattern, gain, directivity, effective aperture, reciprocity and radiation from dipoles of arbitrary length. [6]
3. **Theory of Array Antenna: A**rrays of point sources, Endfire and Broadside arrays, Log-periodic, Yagi-uda arrays, Analysis of Rhombic antenna. Design of Rhombic Antennas, Loop Antenna: Radiation from small loop and its radiation resistance. Helical antenna: Normal and axial mode operation. synthesis of antenna arrays using Schelkunoff polynomial method, Woodward-Lawson method [10]
4. **Frequency Independent Antenna:** Slot, horn antenna, parabolic antenna, aperture antennas and microstrip antenna:Basic characteristics of microstrip antennas, feeding methods, methods of analysis, design of rectangular and circular patch antennas. [8]
5. **Wave Propagation:** Propagation in free space. Propagation around the earth, surface wave propagation, structure of the ionosphere, Sky wave propagation- propagation of plane waves in ionized medium, Determination of critical frequency, MUF. Fading, troposphere propagation, Super refraction. [7]
6. **Antennas for Mobile Satellite System:** Antenna for aeronautical mobile systems, cell-site and mobile antenna, adaptive antennas. [5]

Outcomes: After completion of the course, students will be able to

- select the appropriate portion of electromagnetic theory and its application to antennas.
- distinguish the receiving antennas from transmitting antennas, analyze and justify their characteristics.
- assess the need for antenna arrays and mathematically analyze the types of antenna arrays.
- distinguish primary from secondary antennas and analyze their characteristics by applying optics and acoustics principles.
- outline the factors involved in the propagation of radio waves using practical antennas.

Text Books:

1. C. A. Balanis, Antenna Theory and Design, 3rd Ed, John Wiley & Sons, 2005.

2. W. L. Stutzman, and G. A. Thiele, Antenna Theory and Design, 2nd Ed, John Wiley & Sons, 1998.

3. R. S. Elliot, Antenna Theory and Design, Revised edition, Wiley-IEEE Press, 2003.

Reference Books:

1. R. E. Collin, Antennas and Radio Wave Propagation, McGraw-Hill, 2014.
2. K.D. Prasad, Antenna and Wave Propagation, 3rd Ed., Satya Prakashan, New Delhi, 2003

EE-14.303 **Control System Engineering** **Total Lectures: 40**
3-1-0-4

Objective: The student gains the knowledge of the fundamental principles of analog and digital control system engineering, time response and frequency response analysis with its practical implementation. This course helps in understanding the design of Compensator and PID controller for the Automatic control of Industry.

Pre-requisite: MA-14.201 Applied Mathematics, EE-14.201 Network Analysis & Synthesis

1. **Introduction:** Introduction to control systems, digital control system, types of control systems and their examples, mathematical modeling of systems (mechanical and electrical). [10]
2. **Reduction Techniques:** Block diagram reduction and signal flow graph representation of systems. [10]
3. **Domain Analysis:** Time domain and frequency domain analysis of systems. [7]
4. **Stability:** Concept of stability and algebraic criteria (Hurwitz's and Routh's stability criterion). [4]
5. **Plotting Techniques:** Root locus techniques, Bode plots, polar plots Nyquist criterion and Nichol's chart. [7]
6. **State Variables:** State variable analysis and design. [2]

Outcome: After completion of the course,

- The student will be able to get acquainted of analog and digital control system.
- The student will analyze and to design and development of automatic controller for industrial application.
- The student will gain the knowledge of stability analysis and improvement of stability for control system.
- This course becomes very beneficial for the graduates who wish to work in core sectr industry as most of the core sector is state-of-art control.
- This course becomes very beneficial for the 4^{th} year student who will choose elective paper in Digital control system and other control system elective.

Text Books:

1. K. Ogata, "Modern Control Engineering," Pearson Education/Prentice Hall of India, 2003.
2. I. J. Nagrath and M. Gopal, "Control System Engineering," New Age International Publishers, 2003.
3. M. N. Bandyopadhyay, "Control Engineering Theory and Practice," Prentice Hall of India, 2003.

Reference Books:

1. Syed Hasan Saeed, "Automatic Control Systems (with MATLAB Programs)," S. K. Kataria & Sons, Publisher of Engineering & Computer Books.
2. Samarjit Ghosh, " Control Systems: Theory and Applications," Pearson Education, Second Edition, 2009

EC-14.441 **Principles and Practices of Management** **Total lectures : 26**
Credits : 2-0-0-2

Prerequisite(s): None

Objective(s):

1. To expose the students to fundamental concepts of management and its processes in organizations.
2. To describe the various skills necessary for effective managers.
3. To explain the Individual and Group Behavior along with various leadership Styles

1. **Planning and Organizing** [5]
   Management: Concept, Nature and functions; Planning: Concept, Missions, Objective and Strategies, Steps in Planning; Organizing: Concept, Formal an Informal Organization, Decentralization of Authority, Delegation of Authority, Principles of Organizing, Line and Staff Authority.

2. **Staffing and Controlling** [4]
   Staffing: Definition, Recruitment, Selection, Placement, Promotion, Separation, Performance Appraisal; Controlling: Concepts and Process, Controlling as a Feedback System, Requirements for Effective Control.

3. **Motivation** [4]
   Concept; Theories and Process of Motivation: Maslow's Need-Hierarchy Theory, Herzberg's Hygiene Theory, Goal-Setting Theory, Vroom's Expectancy Theory.

4. **Personality** [3]
   Concept and Determinates, Types and Traits, Personality Attributes Influencing Organizational Behavior, Locus of Control, Machiavellianism, Self-Esteem, Self-Monitoring, Risk-Taking.

5 **Group Behavior and Interpersonal Relationship** [6]
   Groups: Concept and Classification, Stages of Group Development, Rolesand Norms, Group Decision-Making: Group versus Individual, Group Decision Making Techniques and Process, Interpersonal Relationships, Understanding Self and Others, Developing Interpersonal Relationships, Transactional Analysis, Johari Window.

6. **Leadership** [4]
   Concept and Functions; Theories of Leadership: Traits, Behavioral, Situational/Contingency; Inspirational approaches to Leadership: Charismatic Leadership, Transformational Leadership, Transactional Leadership, and Contemporary Leadership.

Outcome(s): By studying this Course, students would be able to understand various Management functions, individual and group behavior. They would also know various styles of Leadership and its applicability. The course would help the students in understanding various organizational contexts and help them understand organizational systems in a better way.

Text Books:

4. Fred Luthans, Organisational Behaviour, 11th Ed., Mc - Graw Hill, 2009

EC-14.421 **VLSI Laboratory** **0-0-2-1**

Objective: To introduce various aspects of VLSI circuits and their design.

Pre-requisite: EC-14.203 Digital Electronics, EC-14.201 Electronics Devices and Circuits

Using the Tanner EDA tools

i) Study the V-I characteristics of NMOS transistor

ii) Study of different invertor designs
   a) Resistive load inverter
   b) NMOS load inverter
   c) PMOS load inverter
   d) CMOS inverter

iii) Implement and verify the functionality for the following using CMOS technology
   a) Two input NAND gate
   b) Two input NOR gate

iv) Implement and verify the functionality for a Boolean function using CMOS technology.

v) Draw the layout for the following and verify its functionality.
   a) CMOS inverter
   b) two input NAND gate
   c) two input NOR gate

vi) Draw and verify the layout the following function

$$X = \overline{(AB + D + EF)}$$

vii) Study of different design styles

vii) Implementation of minor project based on VLSI

Outcome: Generalize the design techniques and analyze the characteristics of VLSI circuits such as area, speed and power dissipation

Text Books:
1. N. H. E. Weste et al, CMOS VLSI design, 3rd Ed., Pearson, 2005.
2. S. M. Kang & Y. Leblebici, CMOS Digital Integrated Circuits, McGraw Hill, 1999.

Reference Books:
1. Uyemura, Introduction to VLSI Circuits and Systems, Wiley, 2002.

EC-14.423 **Antenna and Wave Propagation Laboratory** **0-0-2-1**

Pre-requisite: EC-14.208 Principles of Electromagnetics

1 To Draw the radiation pattern and find the front to back ratio, *VSWR*, Half power beam width of following Antenna's using ST 2261 Antenna Kit

(a) Zeppelin (b) Combined Collinear Array (c) Helix (d) λ/2 Phase Array

(e) λ/4 Phase Array (f) Slot λ/2

2 To Draw the radiation pattern and find the Front to back ratio, VSWR, half power beam-width of following antennas using ST2261Antenna Kit

(A) Yagi-Uda Folded Dipole (3E, 5E) (B) Yagi-Uda Simple Dipole (5E,7E) (C) Simple dipoles (λ/2, λ/4) (D) Folded Dipole

(E) Hertz (F) Ground Plane (G) Log Periodic

3 To Draw the radiation pattern and find the Front to back ratio, VSWR, half power beam width of following antennas using S 45 Antenna Set-up

(A) Dipole L/2 (B) Slotted Cylindrical (C) Yagi 5Element (D) Loop Square

(E) Quad Loop

4 To Draw the radiation patter n and find the Front to back ratio, VSWR, half power beam width of following antenna using S-54 Antenna Set-up

(A) Dipole L/2,L (B) Rectangular Slot (C) Broad side Array (D) Log Periodic Array

(E) End-Fire Array (F) Discone (G) Helical (H) Vertical

5 To Draw the radiation pattern and find the Front to back ratio, VSWR, half power beam width of following antenna using S-99 Antenna Set-up

(A) Printed Dipole Antenna (B) Shielded Loop Anten (C) Log-Periodic (D) Broad side Array

(E) End Fire Array (F) Micro strip (G) Patch Circularly Polarized (H) Spiral Antenna

Outcome: After completion of the Laboratory, students will be able to

(a) Realize the importance of radiation pattern.
(b) Work out the complete design aspects of various antennas.
(c) Distinguish primary from secondary antennas and analyze their characteristics.
(d) Know the significance of various antenna parameters.

Text Book: Lab Manual

EE-14.323 **Control System Laboratory**

0-0-2-1

Objective: This laboratory course facilitates the students to get a comprehensive exposure to various techniques /principles and applications of control systems for real life implementation like like temperature control of oven, position control of DC/AC servomotor, synchro devices as a control transformer, robotic control systems etc.

1. To study the performance of various types of controllers (P, PI, PID) in order to control the temperature of an oven.
2. To study the performance analysis of PC based analogue and digital motor control system (DCMC) with second order feedback system behavior.
3. To study the characteristics of a Synchro Transmitter Receiver pair and use these as torque-synchro and angular error detector.
4. To study the performance characteristics of angular position error detector (AC&DC excitation) using two Potentiometers.
5. Using Nyquist Stability technique, find the stability of negative feedback control system whose open loop transfer function is given by $G(s)\,H(s) = 10/[\,(s+1)\,(s+2)\,(s+3)\,]$ Also verifies the MAT lab results/stability with theoretical method after ploting on graph sheets.
6. To study the performance characteristics of an AC servo motor angular position control system and analysis of transient characteristics with gain Variation.
7. To study the performance characteristics of a DC servo motor angular position control system and analysis of transient characteristics with gain Variation and additional tachometer feedback.
8. To study the Characteristics of an A.C. Servo Motor and determine its transfer function.
9. Plot the Root locus diagram for investigating the stability for the system whose open loop transfer function given by $G(s)\,H(s) = K/[s\,(s+4)\,(S+5)]$. Using MAT Lab Code, verify the results with Conventional method.
10. To study and design the pc based universal robotic system as snake.
11. Draw the bode plot for the transfer function $G(s) = 50/[s\,(1+0.25s)\,(1+0.1s)]$. From the graph, determine:
    1. Gain Crossover Frequency
    2. Phase Crossover Frequency
    3. Gain Margin
    4. Phase Margin
    5. Stability of the system

Also, verify the mat lab results with theoretical value.

12. Obtain the state space, pole-zero and residue pole form of the control system whose transfer function is given by

Outcome: The students shall develop an insightful knowledge on various techniques and concepts of analysis & design of control system for different applications like temperature control of oven, position control of DC/AC servomotor, synchro devices, Robotic control systems etc.

Text Books:

EC-14.433 Industrial Training Seminar Credits: 2

Industrial training plays a very important role for engineering graduates of all disciplines. As an engineering student, training can help to implement the concepts that students have learnt in their classes.

Objective: To enhance the knowledge of the students on different cutting edge technologies which have become important part of respective industries.

Industrial training offers the following:

1. Experience of industrial environment/conditions to girls students.
2. Enable the students to learn engineering techniques by observation and practice.
3. Show how theory presented in class is applied in practice.
4. Provide contact with practicing engineers.
5. Familiarize the student with practices and problems faced by companies employing engineers.
6. Give the student the responsibility of completing a piece of work.
7. Enable and accord industry opportunity to shape and participate in the development of future human resources.

Training Outcomes and Assessment

1. Ability to acquire and apply fundamental principles of science and engineering.
2. Capability to communicate effectively
3. Ability to identify, formulate and model problems and find engineering solution based on a systems approach.
4. Ability to conduct research in the chosen fields of engineering.
5. Understanding of the importance of sustainability and cost-effectiveness in design and developments of engineering solution.
6. Ability to be a multi-skilled engineer with good technical knowledge, management, leadership and entrepreneurship skills.
7. Awareness of the social, cultural, global and environmental responsibility as an engineer.
8. Capability and enthusiasm for self-improvement through continuous professional development and life-long learning.

BS-15.411 Business Support System – Intelligent Network (BSS-IN) 3-0-0-3

Total Lecture: 42

Prerequisites: Linux Basic, Database Basic, TCP/IP Basic.

1 Introduction to Telecom Market **[2]**

Customer and Vendors, How Adds and promotion benefits, Statistics (Postpaid/Prepaid).

2 Unit 2: GSM Basic and Evolution **[4]**

Architecture, Call Flows (Cover RAN/CORE/IN), OSI/SS7 Basic, Evolution (2G to 5G)

3 Unit 3: Intelligent Network Overview **[11]**

Common Charging Architecture - High Level Common Architecture, Charging Mechanisms, Charging Functions- Offline Charging Funtions; Offline Charging Funtions; Architecture Mapping ,Charging Principles; Charging data generation and quota supervision; Charging information utilization, OCS - Required Functionality, OCS - Reference Model/Architecture, OCS Rating Function, OCS Functionality Message Flows, OCS CDRs, Policy Control And Charging; Reference Architecture;Policy Control Requirements; Reference Points; Functional Entities; PCC Rules; QoS Rules; PCC Procedure and Flows, Refill And voucher management, Subscriber/Customer management - Customer Care

4 Unit 4*:* Billing Mediation and Provisioning Basic **[14]**

CDR, UDR, TAP files, RAP files, NRTRDE, Billing System architecture (Mediation, usage and tariff database, formatting and rating processes, invoice generation),Types of usage (duration, volume, QoS, day and time, number of events, type of service),Types of rating (batch rating, pre-event rating, post-event rating, backwards rating, prepaid balance management, spending control/unbilled limit), Standard rating functions (staircase, offset, linear), Parameters of billing (usage & recurring &onetime charges, discounts & fees & taxes),Types of billing (regular, on-demand, immediate, simulation, information), Different product features (supports MVNO, real-time discounts, cross discounts, shared balances, multiple balances), Different marketing tools (business partners, bundles and counters, F&F, free units, discounts), Typical Telecom Environment: Multivendor environment, Std Protocols & proprietary Interfaces, Integration challenges, File Mediation fundamentals: ASN.1, Need, Typical Use Cases, Architecture, Event Mediation fundamentals: Diameter, 3GPP, Need, Typical Use Cases, Architecture

Provisioning fundamentals: MML, CAI, CAI-3G etc, Need, Typical Use Cases, Architecture

5 Protocols/Tools **[9]**

TCP/IP/SCTP; Stack Description ; Connection Flow; Messages Flow; Use Cases ,SIGTRAN/SS7; Stack Description; Connection Flow; Messages Flow; Use Cases, DIAMETER; Stack Description; Connection Flow ;Messages Flow; Use Cases, CAMEL ; Stack Description; Connection Flow ;Messages Flow ;Use Cases

6 3PP Services integration with BSS [2]

Integration With CRBT/MoMo, IVR Services, Practical Example/Use Cases.

Assessment [2]

EC 15.413 **Advanced Embedded System** **Total Lectures: 40**

3-0-0-4

Objective:

1. To teach the Fundamentals on design attributes of functional units of a Processor
2. To discuss on Hardware software partitioning in system design
3. To teach intra & Inter processor Communications
4. To discuss strategies for processor Communications

Understanding of necessity of operating system in advanced embedded systems.

Prerequisite: EC 14.202 Microprocessor Programming and Interfacing, EC 14.306 Microcontroller and Embedded System

7. Introduction to Embedded Hardware and Software: Terminology – Gates – Timing diagram – Memory – Microprocessor buses – Direct memory access – Interrupts – Built interrupts – Interrupts basis – Shared data problems – Interrupt latency - Embedded system evolution trends – Interrupt routines in an RTOS environment. [8]
8. System Modelling with Hardware/Software Partitioning: Embedded systems, Hardware/Software Co-Design, Co-Design for System Specification and modelling- Single-processor Architectures &,Multi-Processor Architectures, comparison of Co- Design Approaches, Models of Computation, Requirements for Embedded System Specification, Hardware/Software Partitioning Problem, Hardware/Software Cost Estimation, Generation of Partitioning by Graphical modelling, Formulation of the HW/SW scheduling, Optimization. [8]
9. Hardware/ Software Co-Synthesis: The Co-Synthesis Problem, State-Transition Graph, Refinement and Controller Generation, Distributed System Co-Synthesis. [8]
10. Memory and Interfacing: [8]
    Memory: Memory write ability and storage performance – Memory types – composing memory – Advance RAM interfacing communication basic – Microprocessor interfacing I/O addressing – Interrupts – Direct memory access – Arbitration multilevel bus architecture – Serial protocol – Parallel protocols – Wireless protocols – Digital camera example.
11. Concurrent Process Models and Hardware Software Co-Design: Modes of operation – Finite state machines – Models – HCFSL and state charts language – state machine models – Concurrent process model – Concurrent process – Communication among process –Synchronization among process – Implementation – Data Flow model. Design technology – Automation synthesis – Hardware software co-simulation – IP cores – Design Process Model. [8]

Outcomes: After completing this module, students will be expected to be able to:

1. Implement a RTOS based embedded system and uunderstand the embedded systems design process.
2. Define a specification for an embedded system.
3. Design an embedded system based on a specification.
4. Discuss methods for implementing reliable embedded systems to solve various problems.

Compare and contrast different options for the realisation of embedded systems and their suitability for their application domain.

EC 15.415 ROBOT PROGRAMMING Total Lectures: 40
Credit : 3-0-0-3

OBJECTIVES: To study the use of robot programming for various applications.

Prerequisite: Nil

UNIT I - Basics of Robot Programming [8]

Robot programming-Introduction-Types- Flex Pendant- Lead through programming, Coordinate systems of Robot, Robot controller- major components, functions-Wrist Mechanism-Interpolation-Interlock commands- Operating mode of robot, Jogging-Types, Robot specifications- Motion commands, end effectors and sensors commands.

UNIT II - Val Language [8]

Robot Languages-Classifications, Structures- VAL language commands motion control, hand control, program control, pick and place applications, palletizing applications using VAL, Robot welding application using VAL program-WAIT, SIGNAL and DELAY command for communications using simple applications.

UNIT III - Rapid Language [8]

RAPID language basic commands- Motion Instructions-Pick and place operation using Industrial robot- manual mode, automatic mode, subroutine command based programming. Move master command language- Introduction, syntax, simple problems.

UNIT IV - Practical Study of Virtual Robot [8]

Robot cycle time analysis-Multiple robot and machine Interference-Process chart-Simple problems-Virtual robotics, Robot studio online software- Introduction, Jogging, components, work planning, program modules, input 13 RB-2013 SRM and output signals-Singularities-Collision detection-Repeatability measurement of robot-Robot economics.

UNIT V - VAL-II and AML [8]

VAL-II programming-basic commands, applications- Simple problem using conditional statements-Simple pick and place applications-Production rate calculations using robot. AML Language-General description, elements and functions, Statements, constants and variables-Program control statements-Operating systems, Motion, Sensor commands-Data processing.

Outcomes: Upon completion of this course the students can able to understand the basic of Robot programming.

Text Books:

1. Mikell P. Groover et. al., "Industrial Robots - Technology, Programming and Applications", McGraw Hill, New York, 2008.
2. Deb. S. R. "Robotics technology and flexible automation", Tata McGraw Hill publishing company limited, 1994.

2. Craig. J. J. "*Introduction to Robotics mechanics and control"*, Addison-Wesley, 1999.

EC-18.402 **Wireless Networks** **Total Lectures: 40**
3-1-0-4

Objective: To acquire fundamental knowledge of various types of wireless networks and apply them to wireless communication applications.

Pre-requisite: EC-14.303 Principles of Analog Communication, EC-14.304 Principles of Digital Communication

1. **Introduction:** Introduction to wireless networks, Wireless communication systems – Paging system, cordless telephone system, cellular telephone system [4]

2. **Basics of cellular communication systems**: Frequency reuse, channel assignment, call handoff, interference and system capacity, Mobile radio propagation – path loss and fading, 2G, 2.5 G and 3G wireless networks**.** [10]

3. **Multiple Access Techniques**: Frequency Hopped Multiple Access, Code Division Multiple Access, Hybrid Spread Spectrum Multiple Access, Packet Radio, Carrier Sense Multiple Access, Reservation Protocol [10]

4. **Equalization, Diversity and Channel Coding**: Fundamentals of equalization, Linear equalization, Nonlinear equalization, Diversity techniques – space diversity, time diversity, frequency diversity, polarization diversity, RAKE receiver, Block code and convolution code. [8]

5. **Wireless Networking**: Wireless local area network, RF and IR WLAN, advantages and applications, IEEE 802.11, IEEE 802.16, HYPERLAN, Bluetooth, WiMax, Ultra Wide Band communication. [8]

Outcome: After completion of the course, students would be able to apply wireless communication concepts and ideas to engineering applications and to develop high performance wireless communication network.

Text Books:

1. T. S. Rappaport, Wireless Communication, Principles and Practice, 2nd Ed, Pearson Education, 2009
2. Upena Dalal, Wireless Communication, Oxford University Press, 1st Ed., 2009.
3. J. Schiller, Mobile communications, Addison-Wesley.

Reference Book:

1. William C. Y. Lee, Mobile cellular telecommunication – Analog and Digital systems, McGraw Hill, 2nd Ed, 2006

EC-18.442 **Engineering Economics** **Total Lectures: 26**
Credit: 2-0-0-2

Prerequisite(s): Nil

Objective(s):
1. Provide students with fundamental concepts of engineering economics.
2. Provide students with economical methods to compare and evaluate alternatives based on present, annual, rate of return, and benefit over cost analyses.
3. Emphasize practical engineering-based applications and the use of real data examples.

1. **Introduction**: Definitions, Scope; Microeconomics vs. Macroeconomics; Engineering and engineering economics; Principles of engineering economics. [2]
2. **Theory of Demand & Supply**: Determinants, law of demand, law of supply, equilibrium, elasticity of demand. [3]
3. **Economics Applied to Industries**: Theory of production; production function, Law of variable proportions, Returns to scale, Theory of cost; Various concepts of cost: Fixed cost, variable cost, average cost, marginal cost, money cost, real cost, opportunity cost, average cost, marginal cost, total cost etc; Break even analysis. [6]
4. **Market Structures& Pricing Techniques:** Meaning of Market, Types of Market- perfect competition, Monopoly, Oligopoly, Monopolistic Competition (Main features of these markets). [5]
5. **Replacement analysis and depreciation**: Replacement Analysis Decision Map, Basic aspects of depreciation, Deterioration & Obsolescence, and its methods [3]
6. **Optimization technique**: Optimization under constraints and without constraints, optimal resource allocation, optimization under risk and uncertainty. [4]
7. **Capital budgeting**: Concept; under certainty and uncertainty, Techniques; Discounting &compounding techniques, IRR, NPV, PBP, Profitability index, Accounting rate of return. [3]

Outcome(s):
1. Understand major principles of economic analysis for decision making among alternative courses of action in engineering.
2. Apply cost estimation and alternative analysis techniques for engineering applications.
3. Recognize the economic impact of engineering solutions.
4. Calculate depreciations and understand the impact of inflation.
5. Perform breakeven analysis for a single project and between two alternatives.

Text Books:
1. Salvatore, Dominick. Managerial Economics, Prentice Hall of India, 6th Ed.
2. D. N. Dwivedi, Managerial Economics, OUP, Vikas Publication, 7th Ed.

Reference Books:
1. Suma Damodran, Managerial Economics, OUP, 2nd Ed.

EC-18.434 **Technical Seminar** **Credit: 0-0-0-2**

Objective:

1. To encourage the students to study advanced engineering developments and state-of-the-art activities.
2. To develop skills to prepare technical report writing and presentation.
3. To encourage the students to use various teaching aids such as overhead projectors, power point presentation and demonstrative models.

During the seminar session each student is expected to prepare and present a topic on engineering/ technology, for duration of about 10 to 15 minutes. The performance of the student will be evaluated based on slide preparation, presentation, ability to address question, etc. At the end of the semester, she will have to submit a technical report on her topic of seminar.

Outcomes:

1. Ability to review, prepare and present technological developments
2. Ability to face the placement interviews

*Theory: Assignments and regularity will be evaluated out of 10(ten) marks in a semester.
Practicals: Practical records and regularity will be evaluated 4 (four) times in a semester. Each evaluation will be out of 10 (ten) marks.
** Theory: Two mid-term examinations of 20 (twenty) marks each
Practicals: Viva/ Quizzes will be held 4 (four) times in a semester, each of 10(ten) marks.
† Evaluation of proficiency will be based on the participation in co-curricular activities.
†† Students will go for an industrial training programme of 8 (eight) weeks in the summer after the end of III year Spring semester examination.

N.B. The curricular structure is subject to revision from time to time, which will be duly notified.

MA-14.101 **Mathematics-I** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): NIL

Objective(s):

- To acquire fundamental knowledge of Mathematics and apply in engineering disciplines.

1. **Calculus:** Review of basic concepts, partial differentiation, Euler's theorem on homogeneous functions, Taylor's series and Jacobian, maxima and minima of functions of two variables, asymptotes, tracing of simple Cartesian curves, length of plane curves, area bounded by the curves, multiple integrals (double and triple integrals, change of order of integration), physical interpretations and applications. [16]
2. **Three-dimensional Geometry**: Direction cosines and direction ratios of a straight line, equation of a plane, plane passing through intersections of two planes, equations of a straight line, the shortest distance between two skew lines, the equation of a sphere, intersection of plane and sphere. [10]
3. **Matrix Theory**: Rank of matrix, linear dependence and independence of vectors, solution of system of simultaneous linear equations, Eigen values, Eigenvectors of a matrix, statement of Cayley-Hamilton theorem (without proof) , reduction of a matrix to diagonal form, quadratic forms, linear transformation of a quadratic form, and applications. [10]
4. **Theory of Equations**: Introduction of polynomials, the relation between roots and coefficients, Cardon's method. [4]

Outcome(s):

- After completion of the course, students would be able to apply mathematical knowledge in engineering and solve curriculum problems.

3. Veerarajan T., Engineering Mathematics (for first year), TMH Publishing Company Limited, New Delhi, 2nd Edition 2001.

MA-14.102 **Mathematics-II** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): NIL

Objective(s):

- To acquire fundamental knowledge of Mathematics and apply in engineering disciplines.

1. **Computational Methods**: Introduction and importance of numerical analysis, calculus of finite differences, interpolation schemes for equal and unequal intervals (Newton's forward and backward interpolation formulae), divided difference, interpolation for unequal intervals (Newton's divided difference and Lagrange interpolation formulae), solution of algebraic and transcendental equations by Newton-Raphson method, applications to Engineering. [13]
2. **Ordinary Differential Equations:** First order and first-degree differential equations (variable separable, homogeneous, linear, exact equations, linear differential equations of second order with constant and variable coefficients (complementary functions and particular integrals) and applications. [12]
3. **Partial Differential Equations**: Formation of partial differential equations, Lagrange's multipliers method for the solution of first order differential equations, separation of variables for nonlinear differential equations and applications. [5]
4. **Vector calculus**: Vector and scalar point functions, conservative fields, gradient of scalar point functions, divergence and curl of vector point functions (Solenoidal and irrotational vectors), directional derivative of scalar point functions, work done along a curve, integration of vectors, line integral (work done), surface integral, volume integral, physical interpretations and applications. [10]

Outcome(s):

- After completion of the course, students would be able to apply mathematical knowledge in engineering and solve curriculum problems.

Text Books:

1. Grewal, B.S. and Grewal, J.S., Higher Engineering Mathematics, Khanna Publishers, Daryaganj,New Delhi, 40th Edition, 2007.

PY-14.101 **Engineering Physics** **Total Lectures: 40**

Credit: 3-0-0-3

Prerequisite(s): NIL

Objective(s):

- To make a bridge between the physics in school and engineering courses.

1. **Modern Physics**: Introduction to black body radiation spectrum, photoelectric effect, Compton effect. Wave-particle Dualism, deBroglie hypothesis, de Broglie wavelength, extension to electron particle, Davisson and Germer experiment, matter waves and their characteristic properties, phase velocity, group velocity and particle velocity, relation between phase velocity and group velocity, relation between group velocity and particle velocity, expression for deBr;oglie wavelength using group velocity. [8]
2. **Quantum Mechanics:** Heisenberg's uncertainty principle and its physical significance, application of uncertainty principle (non-existence of electron in the nucleus, explanation for decay and kinetic energy of electron in an atom), wave function, properties and physical significance of wave function, probability density and normalization of wave function, setting up of one dimensional time independent Schrodinger wave equation, eigenvalues and eigenfunctions, application of Schrodinger wave equation, energy eigenvalues for a free particle, energy eigenvalues and eigenfunctions for a particle in a potential well of infinite depth. [7]
3. **Electrical Conductivity in Metals**: Free–electron concept, classical free electron theory Assumptions, drift velocity, mean collision time and mean free path, relaxation time, expression for drift velocity, expression for electrical conductivity in metals, effect of impurity and temperature on electrical resistivity of metals, Quantum free electron theory assumptions, Fermi – Dirac statistics, Fermi-energy, Fermi factor, density of states (No Derivation), expression for electrical resistivity / conductivity, temperature dependence of resistivity of metals, electron in a periodic potential, origin of the energy gap, band theory of solids, distinction of solids into metals, semiconductors and insulators. [8]
4. **Dielectric & Magnetic Properties of Materials**: Dielectric constant and polarization of dielectric materials, types of polarization, equation for internal field in liquids and solids (one dimensional), Ferro and Piezoelectricity, frequency dependence of dielectric constant, important applications of dielectric materials, classification of dia, para and ferro-magnetic materials, hysteris in ferromagnetic materials, soft and hard magnetic materials, applications. [7]
5. **Lasers and Optical Fibers**: Einstein's coefficients (expression for energy density), requisites of a Laser system, condition for laser action, principle, construction and working of CO_2 laser and semiconductor laser, applications of laser – Laser welding, cutting and drilling, measurement of atmospheric pollutants, holography–principle of recording and reconstruction of images, applications of holography, propagation mechanism in optical fibers, angle of acceptance, numerical aperture, types of optical fibers and modes of propagation, attenuation, application, block diagram discussion of point to point communication. [10]

Outcome(s):

- The student will be able to understand many modern devices and technologies based on lasers and optical fibers. A student can also appreciate various material properties which are used in engineering applications and devices.

Text Books:

1. S. O. Pillai, Solid State Physics, Sixth Edition, New Age International.
2. V. Rajendran, Engineering Physics, TMH.

Reference Book: 1.G. K. Shivkumar, Engineering Physics, Prism Book Pvt. Ltd.

CY-14.101 **Engineering Chemistry** **Total Lectures: 40**

Credit: 3-0-0-3

Prerequisite(s): NIL

Objective(s):

- To purify the most valuable natural resource of the future-water.
- To understand one of the most versatile Engineering Materials: Polymers their preparation, properties and uses.
- To develop the basics of protecting engineering materials from the natural forces.
- To understand the present-day up-to-date knowledge of the contemporary energy sources.
- To build up the basis of the future Engineering materials like superconductors, conducting organic polymers, Nanomaterials etc.

1. **Water treatment**: Hardness, types of hardness, determination of hardness by complex metric (EDTA) method, degree of hardness, boiler troubles: corrosion, sludge and scale formation, prevention of sludge and scale formation in boilers, methods of boiler water treatment: lime-soda process, permutit (zeolite) process, ion exchange methods, numerical problems based on water treatment (lime-soda process). [10]
2. **Organic and Inorganic Polymers:** Classification, functionality, types of polymerization, mechanism of addition polymerization, plastics: thermoplastic and thermosetting resins, preparation, properties and uses of Polyamides, Bakelite, Polyesters, Rubber, vulcanization of rubber, synthetic rubber viz. Buna-S, Buna-N, Butyl and Neoprene rubbers, Silicones-polysiloxanes and Sulphur based polymers. [8]
3. **Electrochemistry and Corrosion**: Classifications (Galvanic cell, electrolytic cell), types of electrodes (reference electrodes-standard hydrogen electrode, indicator electrodes- glass electrode), the origin of electrode potential, Nernst equation of electrode potential. electromotive force, electrochemical series. corrosion: definition and its significance, theories of corrosion, mechanism of corrosion, types of corrosion, Galvanic cell, and concentration cell, water line corrosion, pitting & stress corrosion (caustic embrittlement), protection against corrosion, corrosion control (corrosion inhibitors, cathodic protection - sacrificial anodic and impressed current cathodic protection), protective metallic coatings. [10]
4. **Fuels:** Classifications of fuels, Comparison of solid, liquid & solid fuels, Calorific value of a fuel, Bomb calorimeter, determination of LCV & HCV, petroleum: origin, composition, processing, cracking, synthetic petrol, refining, reforming, knocking, unleaded petrol, LPG as a gaseous fuel, numerical problems based on combustion. [6]
5. **New Engineering Materials**: Introduction: superconductors, high and low-temperature superconductors, organic electronic materials, fullerenes and nanomaterials, industrial applications of fullerenes and nanomaterials. [6]

Text Books:

1. Jain and Jain, Engineering Chemistry, 15th Edition, 2006, Dhanpat Rai Publishing Company.
2. S.S. Dara, A Text Book of Engineering Chemistry, 9th Edition, 2001, S. Chand & Company Limited.

Reference Books:

1. Atkins, Physical Chemistry, 7th edition P.W.
2. J.F. Shakelford, M.K.Murlidhara, Materials Science for Engineers, 6th Edition.
3. Bokris and Reddy, Modern Electrochemistry I, 2nd Edition, Springer.

ME-14.101 **Applied Mechanics** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): NIL

Objective(s):

- This course will help the student to acquire knowledge of basic engineering mechanics concepts and enhance their ability to solve open-ended engineering problems.
- To provide the student with a clear and thorough understanding of the theory and applications of engineering mechanics, covering both statics and dynamics.
- To provide the student with a thorough understanding of the concept, drawing, and the use of free-body diagrams.
- To be able to determine the Centre of Gravity and Moments of Inertia of simple geometric shapes and understand the physical applications of these properties.
- To understand the use and be able to perform calculations related to friction forces in engineering applications.

1. **Introduction:** Idealization of Mechanics, the concept of Rigid Body, External Forces (Body forces & surface forces), Laws of Mechanics. [3]
2. **Force Systems and Equilibrium**: Introduction to vector, Statically Equivalent Force systems, Free Body Diagram, Equations of equilibrium and their applications to the various system of forces. [8]
3. **Distributed Forces and Moment Of Inertia**: Centroid of Composite figures, Area Moment of Inertia, Mass Moment of Inertia, Principle axes and Principle Moment of Inertia. [5]
4. **Friction:** Introduction of friction, Laws of friction, wedge, screw, belt, rolling friction. [5]
5. **Tension, Compression, and Shear:** Normal stress and strain, Linear elasticity, Hooke's Law and Poisson's Ratio, Shear stress and shear strain, Relationship between modulus. [4]
6. **Beams:** Different support & load conditions, SFD, BMD [5]
7. **Kinematics of Particles**: Introduction, Rectilinear motion, Plane curvilinear motion, Rectangular coordinates, Tangential and normal coordinates, polar coordinates, Relative motion (Translating Axes), constrained motion of connected particles. [5]
8. **Kinetics of Particles:** Introduction, Force, Mass and acceleration, Newton's second law of motion, Equation of motion and solution of problems, Work and Energy, Impulse and Momentum. [5]

Outcome(s):

- The students shall develop the ability to identify, formulate, and solve engineering problems related to forces and motion.

Text Books:

1. Timoshenko, S, Young, D.H, Rao, J.V, Engineering Mechanics, 4th edition TMH, 2010.
2. Merian, J.L, Kraige, L.G., Engineering Mechanics Vol I & II, 5th edition Wiley India 2010.

Reference Books:

1. Hibbeler, Gupta R. C., Engineering Mechanics, 11th ed., Pearson India, 2010.
2. Irving. H. Shames, Engineering Mechanics, Prentice Hall Book Company, 1966.

EE-14.101 **Elements of Electrical Engineering** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): NIL

Objective(s):

- This course facilitates the students to get a comprehensive exposure to various concepts and devices of electrical engineering.

1. **Introduction:** Background, major inventions, scope, significance and job opportunities in electrical engineering, brief overview of various energy resources. Apparatus used in generation, transmission, and distribution of electrical power and various industries. [3]
2. **D.C. circuits:** Review of circuit elements, voltage sources, current sources, ohms law, KVL, KCL, source transformation, mesh current and node voltage analysis of circuits. [5]
3. **Network Theorems**: Superposition theorem, Thevenin's theorem, Norton's theorem, Maximum Power Transfer theorem, star-delta transformation. [6]
4. **Single phase A.C. circuits:** Basic terminologies, average & RMS values of a.c. quantities, phasor representation, the response of R, L, C and their combination to a.c. excitation, the concept of power and power factor in a.c. circuits. [6]
5. **Three phase A.C. circuits:** Three phase supply, phase sequence, star connection, delta connection, the relationship between phase and line quantities in 3-phase circuits, measurements of three-phase power underbalanced condition. [6]
6. **Magnetic Circuits & Transformer**: Magnetic circuit, mutually coupled circuit, Transformer: working principle, emf equation, ideal & practical transformer, equivalent circuits, transformer testing: open circuit and short circuit test, losses, voltage regulation and efficiency. [8]
7. **Rotating Machines:** Electro-mechanical energy conversion, introduction to rotating machines and applications [6]

Outcome(s):

- The students shall develop an insightful knowledge on various fundamental elements and devices of electrical engineering.

Text Books:

1. Nagrath & Kothari, Theory and Problems of Basic Electrical Engineering, 2nd edition PHI Publication.
2. Fitzgerald & Kingsley, Basic Electrical Engineering, 3rd edition TMH publication.

Reference Books:

1. H.Cotton, Advanced Electrical Technology, CBS Publication.
2. Vincent Del Toro, Electrical Engineering Fundamentals, 2nd Edition PHI Publication

EC-14.101 **Basics of Electronics Engineering** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): NIL

Objective(s):

- This course would facilitate the learner to acquire good exposure to electronics and communication engineering.

1. **Introduction:** Brief history of major inventions, scope, significance and job opportunities in electronics and communication engineering, Overview of various specializations in ECE, Electronic test and measurement equipment's, Specifications for electronic components. [3]
2. **Semiconductors:** Material and its properties, Formation of energy band diagram, Currents in semiconductors, Fermi-Dirac energy distribution, Types of semiconductors – Intrinsic and Extrinsic, Mass action law, Hall effect. [5]
3. **Diodes:** Introduction, Characteristic of ideal and real diode, Current components in the diode, load characteristics, Breakdown in the diode, Zener diode, Varactor diode, Tunnel diode, Clippers and Clampers, Rectifiers – Half and Full-wave rectifiers. [8]
4. **Transistors:** Introduction to PNP and NPN transistors, current components, active, cutoff and saturation regions, CC, CB and CE configuration, Operating point, Biasing circuits, Bias Stability, Thermal runway and thermal stability. [8]
5. **Signals:** Definition, Classification of signals – Analog and Digital, Deterministic and Random signals, Power and Energy of signals, Bandwidth, Bit and Baud rate. [4]
6. **Basics of Communication**: Definition, Block representation of communication system, Modulation – Definition, Need for modulation, Frequency translation, Types of modulation - Analog and Digital, Multiplexing – TDM and FDM. [6]
7. **Applications of Communication**: Introduction to - Optical Fiber, Transmission line, Waveguides, Satellite communication, and RADAR. [6]

Outcome(s):

- The learners are expected to have an overview of electronics and communication engineering and learn the introductory concepts in each of the specializations in ECE.

Text Books:

1. George Kennedy, Bernard Davis, Electronics Communication Systems, 3rd Edition, Tata McGraw-Hill, 2007.
2. Behrouz Forouzan, Data Communication, and Networking, 4th Edition, McGraw-Hill, 2006.
3. Robert L. Boylestad, Louis Nashelsky, Electronics Devices and Circuits Theory, 10th Edition, Prentice Hall, 2009.

Reference Books:

1. David A. Bell, Electronics Devices, and Circuits, PHI, 4th edition, 2008.
2. Wayne, Tomasi, Advanced Electronic Communication Systems, 6th edition, PHI, 2013.

CS-14.101 **Programming Language** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): NIL

Objective(s):

- To learn principles of programming by the structured native language 'C'.
- To comprehend the rudiments, constructs, syntax, and statements with essentials of efficient compiling, running and debugging processes.

1. **Introduction:** The role of programming languages, programming paradigms, language description and syntax structure, basics of structured programming, object-oriented programming, functional programming, logic programming, concurrent programming. [10]
2. **Fundamentals of 'C' language** : Character set, variables data types constants, arithmetic, relational and logical operators, type conversion, increment, decrement, bitwise and assignment operators, conditional expressions, statements and blocks, *if-else*, *switch*, loops - *do-while*, *while*, *for*; *break, continue* and *goto* statements, labels. [10]
3. **Functions, pointers and Arrays**: Basics of functions, automatic, external, static and register variables, scope rules, and header files, recursion and C preprocessor, arrays, pointers and addresses, pointers and arrays address arithmetic, character pointers and functions, pointer arrays, pointers to functions, pointers and multidimensional arrays, command line arguments. [10]
4. **Structures, unions and file processing:** Basics of structures, structures, and functions, arrays of structures, pointers to structures, self-referential structures, unions, bit fields, the concept of files, standard input and output, formatted output, file access in different modes, reading from and writing to a file. [10]

Outcome(s):

- Students would be able to apply learning and knowledge of C language analytically, critically and logically to solve mathematical, scientific and real-life problems in an efficient manner.

Text Books:

1.Brain W. Kernighan and Dennis M. Ritchie, The C Programming Language, Second edition, Pearson Education, 2013,
2.Ravi Sethi & K.V.Viswanatha, Programming Languages-Concepts, and Constructs, Second edition, Pearson Education,2013,

Reference Books:

1.Herbert Schildt, C: The Complete Reference, Fourth Edition, McGraw-Hill Education, 2000
2.E Balagurusamy, Programming in ANSI C, Tata McGraw - Hill Education

ME-14.111 **Computer Aided Engineering Drawing** **Total Lectures: 40**

Credit: 0-0-4-2

Prerequisite(s): NIL

Objective(s):

- To improve the visualization skills.
- To enable the students with various concepts like dimensioning, conventions and standards related to working drawings in order to become professionally efficient.
- To impart the knowledge of understanding and drawing of simple engineering products.

1. **Introduction to Computer Aided Sketching**: Introduction, Drawing Instruments and their uses, BIS conventions, Lettering, Dimensioning and freehand practice. Board Drawing vs. Computer- Aided Drawing. Introduction to Solid works Environments. Computer screen, the layout of the software, standard toolbar/menus and description of most commonly used toolbars, navigational tools. Co-ordinate system and reference planes. Definitions of HP, VP, RPP &LPP. Creation of 2D/3D environment. Selection of drawing size and scale. Commands and creation of Lines, Co-ordinate points, axes, dimensioning, line conventions, material conventions and lettering. [8]
2. **Orthographic Projections**: Horizontal planes, Vertical planes, Front view, Top view, Side view, Projections, the First and Third angle of projection, Projections of points, Principles of orthographic projections, Sketching of different views of given objects. Introduction to sketching in Solid works : 2-Dimensional Sketching, Sketching in Solid works, poly-lines, square, rectangle, polygons, splines, circles, ellipse, text, move, copy, off-set, mirror, rotate, trim, extend, break, chamfer, fillet, curves, constraints viz. tangency, parallelism, inclination, and perpendicularity. [12]
3. **Projections of Lines, Planes, and Solids**: Lines inclined to both the principal planes, the projection of Lamina inclined to both principal planes, Projections of solids: Axis inclined to both the reference planes and Intersection of solids. Introduction to the part module in Solid works: Extrude, Revolve, Sweep, Hole, Filleting, and Chamfering features. [12]
4. **Sections of solids and sectional orthographic views:** Sectional orthographic projections - Full, Half, Partial, revolved and removed surfaces. Introduction to drawing module in Solid works: Standard 3 views, Auxiliary view, Section View, Projected view. [12]
5. **Isometric Projection:** Terminology, Isometric scale, Box method, Coordinate or offset method, Four-center method, the isometric projection of arcs. Solid models practice using Solid works part module. [8]

Outcome(s):

- Students will be able to improve their visualization skills so that they can apply these skills in developing new products.
- Students will be able to know and understand the conventions and the methods of engineering drawing using Solid works.
- Students will be able to prepare simple drawings of engineering products.

Text Books:

1. N.D. Bhatt, "Engineering Drawing", Charotar Publishing House, 2013.
2. Prof. Sham Tickoo, Sandeep Prem Dass Solid works 2013 for Engineers and Designers Wiley Publication, 2013.

Reference Books:

1. Randy H. Shih, Solid works 2013 and Engineering Graphics: An Integrated Approach, SDC Books: Publications. 2013
2. David Planchard, "Engineering Graphics with Solid Works 2014 and Video Instruction", SDC Publications, 2013.

CS-14.111 **Programming Lab** **Credit: 0-0-2-1**

Prerequisite(s): NIL

Objective(s):

- To learn the implementation of programming language.

1. **C- Language Basics**: 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.
2. **Control Statements**: 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.
3. **Functions:** 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.
4. **Arrays:** 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.
5. **Pointers:** 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.
6. **Structure and Union**: 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.
7. **I/O and File Structure**: 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.

Outcome(s):

- The students will be able to implement efficiently the logic into a program.

PY-14.111 **Physics Lab** **Credit: 0-0-2-1**

Prerequisite(s): NIL

Objective(s):

- To make the students gain practical knowledge to co-relate with the theoretical studies.

1. To study the material constant, temperature coefficient of current and Planck's constant.
2. To determine the specific resistance of a given wire by using the Carey Foster's bridge.
3. To determine the ballistic constant, K of a moving coil ballistic galvanometer with a standard capacitor of known capacity.
4. To determine the high resistance by the method of leakage of a condenser with the help of ballistic galvanometer.
5. To study the variations of resistivity with temperature and hence determines the energy band gap of the given semiconductor with help of four probe method.
6. To convert a galvanometer into a voltmeter of a given range.
7. To convert a galvanometer into an ammeter of a given ranges.
8. To plot graph showing the variation of magnetic field with distance along the axis of a circular coil carrying current and to estimate from it the radius of the coil.

Outcome(s):

- After completion of the course, students would be able to develop the skills necessary to perform experiments in physics and acquire an experience of the methods used and analysis needed in experimental physics.

CY-14.111 **Chemistry Lab** **Credit: 0-0-2-1**

Prerequisite(s): NIL

Objective(s):

- To provide students with practical knowledge of quantitative analysis of materials by classical and instrumental methods for developing experimental skills in building technical competence.

1. To determine the Total, Temporary and permanent hardness of water by EDTA method.
2. To determine the % of available chlorine in a sample bleaching powder.
3. To determine the alkalinity of given water sample.
4. To prepare urea formaldehyde resin.
5. To determine the Calorific value of a fuel by bomb calorimeter.
6. Determination of the strength of HCl by titrating it against NaOH pH metrically.
7. Determination of the strength of HCl by titrating it against NaOHconductometrically.

Outcome(s): On completion of this course, students will have the knowledge in

- Handling different types of instruments for analysis of materials using small quantities of materials involved for quick and accurate results.
- Carrying out different types of titrations for estimation of concerned in materials using comparatively more quantities of materials involved for good results.

ME-14.112 **Mechanical Workshop** **Credit: 0-0-2-1**

Prerequisite(s): NIL

Objective(s):

- To learn various hand tools used in fitting, carpentry and sheet metal shop.
- To learn about lathe and drilling machine and their operations.
- To learn how various joints are made using wood and other metal pieces.

1. **Fitting Shop:** Prepare job that contains various fitting operation like filing, marking, measuring, cutting, drilling etc.
2. **Carpentry Shop:** Making of carpentry joint (T, L joint etc).
3. **Sheet Metal Shop:** Making job from the sheet (funnel, tray etc).
4. **Machine Shop:** Perform various operations like turning, step turning, facing, chamfering, knurling etc. on Lathe.

Outcome(s): Students will able to:

- Understand use of tools of Fitting, Carpentry & Sheet Metalworking operations
- Study and practice on lathe and drilling machine and their operations
- Acquire engineering skills in Fitting, Carpentry & Sheet Metalworking operations

EE-14.111 **EEE Lab** **Credit: 0-0-2-1**

Prerequisite(s): NIL

Objective(s):

- The objective of this course is to introduce the students to the basic concepts of Electronics Engineering.
- The aim of this course is to study the fundamental aspects of Electronics Engineering.
- To acquire the knowledge of hardware and verify the results on Multisim software.
- This lab facilitates the students to get a comprehensive exposure to operations of AC and DC machines, measurements of various parameters and applications of electrical machines.

Practical to be performed on Hardware:

1. Introduction to basic electronics components and study of breadboard, CRO, function generator, multimeter, and D.C. power supply.
2. To plot VI characteristics of p-n junction diode and Zener diode.
3. To design a half wave rectifier with and without filter circuit and find the ripple factor.
4. To design a full wave rectifier with and without filter circuit and find the ripple factor.
5. Study of clipper and clamper circuits and implement on a breadboard.
6. To perform soldering and de-soldering to make a banana probe, BNC probe, and connection on PCB.
7. To conduct open circuit test and short circuit test on single phase transformer and to determine equivalent circuit parameters.
8. Measurement of three-phase power by using two wattmeter methods.
9. Speed control of DC machine by field current control method.
10. To construct a fluorescent tube wiring and to measure the voltage across tube rod, the voltage across choke and current.

Practical to be performed using Multi-Sim Software:

1. An Introduction to Electronic Circuit Simulation using **Multi-Sim Software**.
2. To verify Ohm's law and Kirchhoff's law.
3. Simulate half wave and full wave bridge rectifier.
4. To plot VI characteristics of p-junction diode

Outcome(s): After completion of the course, students would be able to:

- To use the technique, skills, and modern engineering tools necessary for engineering practice.
- Able to explain the basic concepts of basic electronics components.
- Able to describe& explain Clipper and Clamper circuits, V-I Characterization of p- n junction & Zener diode.
- The students shall develop an insightful knowledge on various ac and dc machines with their industrial applications.

Code ME 14.201 **Mechanics of Solids** **Total Lectures: 40**

Credit 3-1-0-4

Prerequisite(s): ME-14.101, MA-14.101

Objective(s):

- *To acquaint with the basic concepts of stress and deformation in solids.*
- *To practise the methodologies to analyse stresses and strains in simple structural members, and to apply the results in simple design problems.*
- *Learn the fundamental concepts of the method of superposition, flexibility method, and stiffness method as applied to problems involving statically determinate and indeterminate axial and torsional members, and beams.*
- *Understand the concepts necessary to design the structural elements and pressure vessels.*

1. **Compound Stress and Strains:** Introduction, objective of the course, stresses on inclined sections, strain energy, impact loads and stresses, state of plane stress, principal stress and strain, maximum shear stress, Mohr's stress circle, three dimensional state of stress & strain, generalized Hook's law. **[6]**
2. **Shear Forces and Bending Moment in Beams:** Axial force, shear force and bending moment diagrams for statically determinate (uniform and variable loading) beams including beams with internal hinges for different types of loading. **[4]**
3. **Trusses:** Introduction, simple truss and solution of simple truss, method of joints and method of sections. **[4]**
4. **Stresses in Beams:** Pure Bending**,** normal stresses in beams, shear stresses in beams due to transverse and axial loads, composite beams. **[4]**
5. **Deflection of Beams:** Equation of elastic curve, cantilever and simply supported beams, Macaulay's method, area moment method, fixed and continuous beams, combined bending & torsion of solid & hollow shafts. **[6]**
6. **Columns and Struts:** Buckling and stability, slenderness ratio, combined bending and direct stress, struts with different end conditions, Euler's theory for pin ended columns, effect of end conditions on column buckling, Rankine Gordon formulae, examples of columns in mechanical equipments and machines. **[8]**
7. **Thin cylinders:** Introduction, difference between thin walled and thick walled pressure vessels, Thin walled cylinders, hoop and axial stresses and strain, volumetric strain. **[4]**
8. **Curved Beams:** Bending of beams with large initial curvature, position of neutral axis for rectangular and circular cross sections, stress in crane hooks, stress in circular rings subjected to tension or compression. **[4]**

Outcome(s):

- *Understand the fundamental concepts of stress and strain and the relationship between both through the strain-stress equations in order to solve problems for simple tri-dimensional elastic solids.*
- *Solve problems relating to pure and non-uniform bending of beams and other simple structures.*
- *Solve problems relating to torsional deformation of bars and other simple tri-dimensional structures.*
- *Understand the concept of buckling and be able to solve the problems related to isolated bars.*

Text Books:

1. Gere J. M & Goodno B. J, "Strength of Materials ", CENGAGE Learning, Latest Edition.
2. Popov E. P, "Mechanics of Solids", PHI, New Delhi, Latest Edition.

6. Punmia, Jain and Jain, "Mechanics of Material", Laxmi Publications.

Code ME 14.203

Engineering Thermodynamics

Total Lectures: 40

Credit: 3-1-0-4

Prerequisite(s): MA 14.101, MA 14.102

Objective(s):

- *Identify and use units and notations in thermodynamics*
- *State and illustrate the first and second laws of thermodynamics*
- *Identify and explain the concept of entropy, enthalpy, specific energy, reversibility and irreversibility*
- *Apply the first and second laws of thermodynamics to formulate and solve engineering problems for (i) closed systems, (ii) open systems, and (iii) power cycles*
- *Ability to understand and effectively communicate the fundamentals of thermodynamic analyses and to articulate the basic environmental, economic, and sustainability considerations to the non-thermodynamicist*
- *Use thermodynamic tables, charts, and equation of state (e.g. the ideal gas law) to obtain appropriate property data to solve thermodynamics problems*

1. **Basic Concepts and Definitions:** Introduction and definition of thermodynamics, dimensions and units, microscopic and macroscopic approaches, systems, surroundings and universe, concept of continuum, control system boundary and control surface, properties and state, thermodynamic properties, thermodynamic path, process and cycle, thermodynamic equilibrium, reversibility and irreversibility, quasi static process, energy and its forms, work and heat, gas laws, ideal gas, real gas, law of corresponding states, Dalton's law, Amagat's law, property of mixture of gases, zeroth law of thermodynamics, temperature and its measurement, temperature scale. **[4]**
2. **First Law of Thermodynamics:** Thermodynamic definition of work, thermodynamic processes, calculation of work in various processes and sign convention, non-flow work and flow work, Joule's experiment, first law of analysis for closed system (non- flow processes), analysis of unsteady processes such as filling and evacuation of vessels with and without heat transfer, first law of thermodynamics applied to open systems, steady flow systems and their analysis, steady flow energy equations, boilers, condensers, turbine, compressors, pumps throttling process etc., PMM-I. **[6]**
3. **Second Law of Thermodynamics:** Limitations of first law of thermodynamics, devices converting heat into work, thermal reservoir, heat engines, efficiency, devices converting work into heat, heat pump, refrigerator, coefficient of performance, reversed heat engine, Kelvin Plank statement of second law of thermodynamics, Clausius statement of second law of thermodynamics, equivalence of two statements of second law of thermodynamics, reversible and irreversible processes, Carnot cycle, Carnot engine, Carnot theorem and its corollaries, thermodynamic temperature scale, PMM-II. **[6]**
4. **Entropy:** Clausius inequality, concept of entropy, entropy change in different processes, Tds equation, principle of increase in entropy, T-S diagram, statement of third law of thermodynamics, entropy and disorder, concept of exergy, available and unavailable energy, availability and irreversibility, second law efficiency. **[7]**

5. **Thermodynamic Relations:** Thermodynamic variables, Independent and dependent variables, Maxwell's thermodynamic relations, Thermodynamic relations involving entropy, Thermodynamic relations involving enthalpy and internal energy, Joule-Thomson coefficient, Clapeyron equation**.** **[4]**

6. **Properties of Steam**: Pure substance, property of steam, triple point, critical point, sub-cooled liquid, saturation states, superheated states, phase transformation process of water, graphical representation of pressure, volume and temperature, P-T & P-V diagrams, T-S and H-S diagrams, use of property diagram, steam-Tables &Mollier charts, dryness factor and it's measurement, processes involving steam in closed and open systems. **[6]**

7. **Vapour & Gas Power cycles**: Carnot cycle, Rankine cycle, comparison of Carnot and Rankine cycle, modified Rankine cycle, calculation of cycle efficiencies, variables affecting efficiency of Rankine cycle. Carnot, Otto, Diesel, dual, Atkinson and Brayton cycle. Comparison of Otto, Diesel and dual cycles, calculation of air standard efficiencies, mean effective pressure, brake thermal efficiencies, relative efficiencies of I.C. engine. **[7]**

Outcome(s):

- *Understand the thermodynamics implication and thermodynamics explanation for the states of matter.*
- *Understand and apply basic energy conservation equations for kinetic, potential and flow energies.*
- *Understand the concepts of enthalpy, entropy and the basic laws of thermodynamics.*
- *Understand and solve thermodynamic cycle problems, including the Carnot ideal cycle, the Otto cycle, the Diesel Cycle, Rankine and Brayton*
- *Understand thermodynamic tables, charts, and equation of state (e.g. the ideal gas law) to obtain appropriate property data to solve thermodynamics problems*

2. Moran, M. J and Shapiro H. N, "Fundamentals of Engineering Thermodynamics", John Wiley, 6th ed. 2010.

Code ME14.205

Material Science and Metallurgy

Total Lectures: 40
Credit: 3-0-0-3

Prerequisite(s): PY-14.101,CY-14.101

Objective(s):

- *To acquaint students with the basic concepts and properties of Material Science.*
- *To impart the knowledge on mechanical behavior of materials.*
- *To acquire knowledge in various class of materials (like Ferrous, Non-Ferrous Alloys and Advanced Materials) and their applications.*
- *To impart knowledge on Heat Treatment, Microstructure and Phase diagrams.*
- *To acquire knowledge in destructive and non-destructive testing of materials.*

1. **Introduction to Engineering Material & Material Structure:** Development in materials science, introduction to engineering materials classification of material, crystal structures (BCC, FCC and HCP systems), imperfections in crystals - point defects, line defects, surface and bulk defects, slip, twinning. **[5]**
2. **Phase diagrams:** solid solutions, binary alloy system, lever rule, Iron-carbon equilibrium diagram, TTT diagrams**.** **[7]**
3. **Heat Treatment:** Annealing, normalizing, tempering, hardening (case hardening and surface hardening). **[5]**
4. **Ferrous & Non Ferrous Metals:** Allotropy of Iron, types of ferrous metals, alloy steels, tool steels, stainless steels, cast irons, effect of alloying elements on mechanical properties of steel, designation of steels and cast iron. copper and its alloys – properties, brasses, bronzes, copper- nickel alloys, aluminium and their alloys – corrosion resistance, magnesium, titanium, bearing materials. **[7]**
5. **Polymers, Ceramics and Composites:** Mechanical behavior of polymers, crystallization, melting and glass transition, polymer types, polymer synthesis and processing; ceramics – crystal structures and properties, composites - particle reinforced composites, fiber reinforced composites, structural composites, nanoparticle composites. **[6]**
6. **Mechanical Properties and their Testing:** Destructive Testing**-**tensile test, engineering stress-strain curve, true stress-strain curve, types of stress-strain curves, compression test, formability, hardness testing, different hardness tests- Vickers, Rockwell, Brinell, impact test, ductile and brittle fracture, creep, generalized creep behaviour. non-destructive testing (NDT)- visual Inspection, magnetic particle inspection, dye penetrant inspection, ultrasonic inspection, Selection of NDT. **[10]**

Outcome(s):

- *The students will be enhancing their knowledge of materials &their applications.*
- *Students will be able to design the alloy system of ferrous and non-ferrous metals based on their knowledge of phase diagrams and metal characteristics.*
- *The students will also be able to understand the heat treatment processes and destructive and non-destructive testing of materials.*

4. Material Science and Engineering; I.P. Singh, Subhash Chander; 12th Edition, 2014 Jain Publishers, Delhi.

MA 14.201 **Applied Mathematics** **3-1-0-4**

Total Lecture: 40

Objective: To acquire fundamental knowledge of linear programming, numerical methods, complex analysis and integral transform and apply in engineering disciplines.

1. Linear Programming: Introduction**,** Graphical method (bounded & unbounded solutions); Simplex method, Artificial variable technique (Two phase method, Big –M method); Assignment problem (Hungarian method); Transportation problem (Vogel's approximation method). **[12]**

2. Numerical Methods: Solution of system of equations (Gauss elimination and Gauss - Seidel methods); Solution of algebraic and transcendental equations (Bisection, Ramanujan's and Regula Falsi methods); Solution of ordinary differential equation (Euler's modified, Milne's predictor & corrector Runge-Kutta methods). **[10]**

3. Complex Analysis: Function of complex variable, analytic function, Cauchy- Riemann equations(without proof), integration of complex functions, line integrals in the complex plane, Cauchy integral theorem(without proof), Cauchy integral formula(without proof), zeros and singularities of complex functions, residues. **[06]**

4. Integral Transform: Laplace transform and inverse Laplace transform First and Second Shifting theorems, Convolution theorem (without proof), Solution of ordinary differential equations with initial conditions by Laplace transforms. Fourier series of periodic functions, even and odd functions, Fourier half-range series; Basics of Fourier transforms. **[12]**

Outcome: After completion of the course, students would be able to apply the knowledge of linear programming , numerical methods ,complex analysis and integral transforms in engineering and solve curriculum problems.

Code ME14.211

Mechanics of Solids Laboratory

Total Hours: 24
Credit: 0-0-2-1

List of Experiments

1. To determine the Impact toughness (strain energy) through Izod test. **[2]**
2. To determine the Impact toughness (strain energy) through Charpy test. **[2]**
3. To determine the tensile strength of specimen using Universal Testing Machine. **[4]**
4. To find the modulus of rigidity using torsion testing equipment. **[2]**
5. To find the values of bending stresses and Young's modulus of the material of a beam (say a wooden or steel) simply supported at the ends and carrying a concentrated load at the centre using Universal Testing Machine **[2]**
6. To find the shear strength of given specimen using Universal Testing Machine. **[4]**
7. To find the compressive strength of given specimen using Universal Testing Machine. **[4]**
8. To determine the stiffness of the spring and modulus of rigidity of spring wire using spring testing machine. **[4]**

Code ME14.213 **Thermodynamics Laboratory** **Total Hours: 24**
Credit: 0-0-2-1

List of Experiments

1. To measure temperature using different types of measurement devices and compare the measurement methods for accuracy and ease of use. **[10]**

    a. J and K type thermometer
    b. NTC thermistor
    c. PT 100 platinium resistance thermometer (four wire)
    d. 2 x liquid in glass thermometers
    e. Bimetal and gas (vapour) pressure thermometer

2. To measure the humidity using different type of humidity measurement devices and compare the measurement methods for accuracy and ease of use. **[6]**

    a. Hair hygrometer
    b. Wet and dry bulb hygrometer
    c. Whirling hygrometer

3. To study and determine the various properties of steam with steam generator **[8]**

Code ME14.215 **Computer Aided Machine Drawing** **Total Hours: 24**

Credit: 0-0-2-1

1. **Drawing Standards:** Code of practice for engineering drawing, bis specifications–welding symbols, riveted joints, keys, fasteners. reference to hand book for the selection of standard components like bolts, nuts, screws, keys etc. **[4]**

2. **2-D Drawings:** Limits, Fits -Tolerancing of individual dimensions, specification of fits, manual preparation of production drawings and reading of part and assembly drawings. **[8]**

3. **CAD Practice:** Drawing, Editing, dimensioning, plotting commands, layering concepts, hatching, detailing, assembly, basic principles of GD&T (geometric dimensioning & tolerancing) **[4]**

4. **Assembly Drawing (using CAD software):** Manual parts drawing and preparation of assembled views given part details for components followed by practicing the same using CAD packages. **[8]**

   Suggested Assemblies: Shaft couplings, plummer block, screw jack, lathe tailstock, universal joint, machine vice, stuffing box, safety valves, non return valves, connecting rod, piston and crank shaft, multi plate clutch. preparation of bill of materials

Text Books:

1. P. S.Gill, 'Machine Drawing', S K Kataria and Sons, 2012.
2. Prof. Sham Tickoo, Sandeep PremDass "Solidworks 2013 for Engineers and Designers" Wiley Publication, 2013.

ME 14.202 **Kinematics of Machines** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): ME 14.101

Objective(s):

- *To provide basic concept of kinematics and kinetics of machine elements.*
- *Know different machine elements and mechanisms.*
- *Select Suitable Drives and Mechanisms for a particular application.*
- *Develop ability to come up with innovative ideas.*

1. **Basics Of Mechanisms:** Terminology and definitions - degree of freedom mobility, Kutzbach criterion, Grashoff's law, kinematic inversions of 4-bar chain and slider crank chains, mechanical advantage, transmission angle, description of common mechanisms-single, double and offset slider mechanisms, quick return mechanisms, straight line mechanism. **10**

2. **Kinematics:** Displacement, velocity and acceleration analysis in simple mechanisms-Graphical Method of velocity and acceleration analysis for different mechanisms-instantaneous centre of velocity - angular velocity ratio theorem. coriolis acceleration. Three-dimensional kinematics and kinetics of rigid bodies: translation, rotation about a fixed point, general motion, angular momentum, kinetic energy, momentum equation. **10**

3. **Kinematics Of Cam:** Classifications, displacement diagrams, parabolic simple harmonic and cycloidal motions, layout of plate cam profiles, derivatives of follower motion, high speed cams, circular arc and tangent cams, standard cam motion, pressure angle and undercutting. **10**

4. **Gears:** Spur gear terminology and definitions, fundamental law of toothed gearing and involutes gearing, inter changeable gears, gear tooth action, terminology, interference and undercutting , non-standard gear teeth , helical, bevel, worm, rack and pinion gears (basics only), gear trains , parallel axis gear trains, epicyclic gear trains, differentials , automotive transmission gear trains. **10**

Outcome(s):

- *Identify mechanisms and predict their motion*
- *Calculate the degrees of freedom of mechanisms.*
- *Draw velocity and acceleration diagrams of various mechanisms.*
- *Construct CAM profile for the specific follower motion.*
- *Select appropriate power transmission mechanism.*

Text Books:

ME 14.204 **Total Lectures: 40**

Fluid Mechanics

Credit 3-1-0-4

Prerequisite(s): ME 14.101

Objective(s): *This course deals with the understanding of the physical mechanisms and the mathematical models of fluid mechanics. The objectives of the course is to enable the student;*

- *To know properties of fluid.*
- *To calculate hydrostatic forces on submerged surfaces.*
- *To apply Bernoulli equations.*
- *To calculate friction losses in pipes.*
- *To apply conservation of mass, momentum & energy principle.*
- *To apply boundary condition for different conditions.*

1.	**Introduction:** Physical properties of fluids, concept of shear stress, Newtonian and Non-Newtonian fluids	**2**
2.	**Fluid Statics:** Pressure-density-height relationships, manometers, force on plane and curved surfaces, center of pressure, buoyancy, stability of immersed and floating bodies, fluid masses subjected to uniform acceleration and uniform rotation about the axis.	**6**
3.	**Kinematics Of Fluid Flow:** Types of fluid flow, stream lines, streak lines, path lines, stream tubes, stream function and velocity potential, flow nets	**5**
4.	**Dynamics Of Fluid Flow:** Euler's equation of motion along a streamline and its integration, Bernoulli's equation and momentum equation. Boundary Layer Analysis, Boundary Layer Thickness, Boundary Layer over a flat plate.	**5**
5.	**Dimensional Analysis And Hydraulic Similitude:** Dimensional analysis, Buckingham's pi theorem, important dimensionless numbers and their significance, geometric, kinematic and dynamic studies.	**5**
6.	**Flow Past Immersed Bodies:** Lift and drag, expressions for lift and drag	**4**
7.	**Flow Through Pipes:** Laminar and turbulent flow in pipes, general equation for head loss-Darcy-Weisbach and Fanning's equations, Moody's diagram, energy losses through pipe fitting, flow through network of pipes, power transmission through pipelines.	**6**
8.	**Fluid Flow Measurements:** Introduction, venturimeter, orificemeter, Pitot tube, notches and weirs.	**5**
9.	**Introduction To Compressible Flow:** Velocity of sound in a fluid, Mach number, propagation of pressure waves in a compressible fluid	**2**

Outcome(s):

- *An understanding of fluid mechanics fundamentals, including concepts of mass and momentum conservation.*
- *An ability to apply the Bernoulli equation to solve problems in fluid mechanics.*
- *An ability to apply control volume analysis to problems.*
- *An ability to use potential flow theory to solve problems.*
- *An ability to perform dimensional analysis for problems.*
- *Knowledge of laminar and turbulent boundary layer fundamentals.*

Text Books:

1. Som S and Biswas G, "Introduction to Fluid Mechanics and Fluid Machines", 2nd ed., Tata McGraw-Hill, 2007.
2. Douglas J. F, Gasoriek, J. M, Swaffield, J. and Jack, L, "Fluid Mechanics" 5th ed., Pearson Education, 2008

Reference Books:

1. Young D. F, Munson B, Okiishi T. H and Huebsch W. W, "Fundamentals of Fluid Mechanics", 6th ed., John Wiley, 2009.
2. Clayton T. C, Donald F. N, Roberson J. A and Williams B. C, "Engineering Fluid Mechanics", 9th ed., John Wiley, 2008.
3. Cengal Y and Cimbala J, "Fluid Mechanics", 6th ed., Tata McGraw Hill, 2010.

ME 14.206 **Design of Machine Elements - I** **Total Lecture 40**

Credit: 3-0-0-3

Prerequisite(s): ME 14.101, ME 14.201

Objective(s):

- *Develop an ability to apply knowledge of mathematics, science, and engineering*
- *To develop an ability to design a system, component, or process to meet desired needs within realistic constraints.*
- *To develop an ability to identify, formulate, and solve engineering problems.*
- *To develop an ability to use the techniques, skills, and modern engineering tools necessary for engineering practice*.

1. **Introduction:** Engineering design - an applied decision theory with respect to functional requirements, aesthetic consideration and ergonomic consideration-traditional design methods-synthesis in design, standardization, preferred numbers, derived series of preferred numbers, types of Fits, tolerance with respect to Indian standard, calculation examples, interchangeability, surface Roughness and its designation on drawing. **4**

2. **Design against Static Load:** Factor of safety, design of simple machine parts, design of Cotter Joint, knuckle Joint and Hooke's Joint, theories of Failures, maximum principal stress theory, maximum shear stress theory, distortion-energy theory of failures. **6**

3. **Design against Fluctuating Load:** Methods to reduce stress concentration. Fluctuating stresses, fatigue failure, endurance limit, low cycle and high cycle fatigue, notch sensitivity, reversed stress-design for finite and infinite life, cumulative damage in fatigue, Soderberg and Goodman lines, modified Goodman's diagram, Gerber equation, fatigue design under combined stresses. **5**

4. **Shaft, Keys and Couplings:** Transmission shafts, shaft design on strength basis, shaft design on torsional rigidity bases, ASME code for shaft design, design of hollow shaft, design of keys, design of couplings- muff coupling, rigid flange coupling, flexible coupling, design of shaft for lateral rigidity, Castigliano's theorem, area moment method. **6**

5. **Welded & Riveted Joints:** Design of riveted joints and simple welded connections under concentric loads only, eccentric load in plane of weld, welded joints subjected to bending moment, Welded joints subjected to torsional moment, welded joints subjected to fluctuating forces. **4**

6. **Threaded Joints:** Basic type of screw fastening, terminology of screw thread, ISO metric screw thread, materials and manufacture, simple analysis of bolted joints, eccentrically loaded bolted joints in shear, eccentric load perpendicular to the axis of the bolt, eccentric load circular base, elastic analysis of bolted joints, bolted joints under fluctuating load. **5**

7. **Power Screw:** Forms of threads, multiple threaded screws, terminology of power screw, torque requirement for lifting of load and for lowering of load, self-locking screw, design of screw jack, differential and compound screws. **4**

8. **Springs:** Types of springs, style of end, stress and deflection equation, series and parallel connections, spring material, design of helical springs, concentric springs, multi-leaf spring, design of load spring. **6**

Outcome(s):

- *Be able to analyze the stress and strain on mechanical components; and understand, identify and quantify failure modes for mechanical parts.*
- *Demonstrate knowledge on basic machine elements used in machine design; design machine elements to withstand the loads and deformations for a given application, while considering additional specifications.*
- *Be able to approach a design problem successfully, taking decisions when there is not a unique answer.*

Text Books:

1. Bhandari V. B, "Design of machine elements", Tata McGraw Hill Publication, Latest Edition.
2. Shigley J. E, "Machine Engineering Design", Tata Mc Graw Hill Publication, Latest Edition.

Reference Books:

1. Norton R. L, "Machine design – An Integrated Approach", Tata McGraw Hill Publication, Latest Edition

ME 14.208 **Production Technology-I** **Total Lectures: 40**

Credit: 3-0-0-3

Prerequisite(s): **ME-14.112**

Objective(s):

- *To analyze and understand the metal cutting phenomenon.*
- *To study the conventional machining processes such as lathe, drilling, milling, shaping.*
- *To select process parameters and tools for obtaining desired machining characteristic.*

1.	**Introduction to Manufacturing Processes:** Introduction to manufacturing, classification of manufacturing processes.	**2**
2.	**Metal Cutting Theory:** Introduction, tool materials, tool geometry, mechanics of metal cutting, tool failures, tool wear in metal cutting, tool life, cutting forces and power, machinability, cutting fluids.	**9**
3.	**Turning Operations:** Introduction, constructional features of a center lathe, cutting tools, operations performed on a center lathe, taper turning methods, thread cutting methods, special attachments, limitations of a center lathe, capstan and turret lathes, turret indexing mechanism, tool layout of turret and capstan machines, automatic lathes, tool layout for automatic lathes, machining time estimation.	**10**
4.	**Hole Making Process:** Introduction, constructional features of a drilling, types of drilling machines, drill geometry, mechanics of drilling process, reaming, boring, tapping, other hole making operations, machining time estimation, boring machine.	**6**
5.	**Milling Process:** Introduction, types of milling machines, constructional features of a milling, cutters, milling operations, dividing head, milling mechanics, machining time estimation, machining center	**9**
6.	**Reciprocating Machine Tools:** Introduction to shaper, planner, slotter and broaching	**4**

Outcome(s): *At the end of the course, the student will be able to understand working of lathe, shaper, planer, drilling, and milling and machines. Comprehend speed and feed mechanisms of machine tools. Estimate machining times for machining operations on machine tools. Be able to select proper metal removing processes for the typical application.*

Text Books:

1. Rao P. N, "Manufacturing Technology", Tata McGraw-Hill, Latest Edition.
2. Lindberg Roy A, "Processes and Materials of Manufacture", Fourth edition PHI Latest Edition.

Reference Books:

1. Mikell. P. Grover, Fundamentals of Modern Manufacturing, Pearson Publications Gerling, "All About Machine Tools", New Age International (P) Limited, sixteenth edition, 2000.
2. Chapman W. A. J, "Workshop Technology", Volume 1,2,3, CBS Publishers and distributors, Latest Edition.
3. Kalpakjian, S. and Steven R. Schmid , Manufacturing, Engineering & Technology, Pearson.

ME 14.210 **Automobile Engineering** **Total Lectures: 40**
Credit 3-0-0-3

Prerequisite(s): Nil

Objective(s):
- *To identify various automotive systems & subsystems*
- *To explain working & construction of various automotive systems & subsystems.*
- *To introduce students to engine auxiliary systems like heating, ventilation and air-conditioning.*

1. **Introduction** - Introduction of automobile, classification of automobile, parts of an automobile, performance of an automobile, tractive efforts. **4**
   Chassis - Introduction, classification of chassis, frame types & nomenclature of car body.
2. **Fuel Supply, Lubrication and Cooling System -** Fuel feed system in spark ignition engine, types, gravity & pump feed system, layout of spark ignition engine fuel pump system, function of each component. **10**
   Fuel supply system in compression ignition engine, layout, components, function, types, working & line diagram of common rail, individual pump system, fuel injectors, single orifice, multiple orifices.
   Engine friction, lubrication system, areas of heat flow in engines, temperature distribution and temperature profiles, cooling air and water requirements, cooling systems.
3. **Suspension, Wheels and Tyres** - Introduction, Macpherson struts, Ball joint and torsion bars, Electronic ride control and air suspension systems, Sonar shock absorber and active suspension system **10**
   Introduction, Requirement & types of wheels , wheel balancing, wheel alignment
   Introduction, requirements & types of tyre, tyre construction, tyre materials, tyre shape, tread patterns, tyre inflation pressure, causes of wear.
4. **Steering, Gears and Controls -** Purpose, function, general arrangements of steering systems, steering gears, steering ratio, drag link, power steering. **10**
   Clutch- Types, necessity, construction & working, torque-converters.
   Gear Box- Types of gear box, construction & working of constant mesh gear box, synchromesh gear box, propeller shaft & differential,
   Axle- Type of rear axles, front axles & their applications, stub axles
5. **Automotive Electrical & Auxiliary Systems -** Electrical circuit component, symbol and wiring diagrams, battery, starting motor, dynamo, alternators, lighting. **6**
   Auxiliary systems like heating, ventilation and air-conditioning.

Outcome(s):
- *Develop non-working models of automobile sub- systems*
- *Formulate steering, braking and suspension systems*
- *Select a suitable conventional and automatic transmission system*
- *Identify the usage of automotive systems & hybrid vehicles.*

Text Books:
1. William. H. Crouse, (2006), Automotive Mechanics, 10th Edition, McGraw-Hill.
2. Kirpal Singh, Automobile Engineering, Vol.1&2, Standard Publications.

Reference Books:

2. James E. Duffy, Modern Automotive Technology, Goodheart Willcox Company, 1994

ME 14.212 **Production Technology Laboratory –I** **Total Hours: 24**
Credit: 0-0-2-1

List of Experiments

1.	Study of center lathe machine.	**[2]**
2.	Job – I: Facing, Plain turning, Step turning, External taper turning, External threading, Knurling, Parting off.	**[4]**
3.	Job – II: Facing, Plain turning, Drilling, Boring, Internal threading. Mating with Job I	**[4]**
4.	Study of Shaper	**[2]**
5.	Job – III: To cut multi slots on shaper.	**[2]**
6.	Study of milling machine and calculation of indexing mechanism on Universal Dividing Head.	**[4]**
7.	Job IV: Slotting on milling machine.	**[2]**
8.	Job V: To cut gear teeth on milling machine using dividing head.	**[2]**
9.	Study of radial drilling machine and making of one job with different drilling and reaming operations	**[2]**

ME 14.214 **Fluids Mechanics Laboratory** **Total Hours: 24**
Credit: 0-0-2-1

List of Experiments

1. To Study Bourdon tube pressure gauge. **[2]**

2. To calibrate pressure gage. **[2]**

3. Study of Venturimeter. **[6]**

a. To measure complete static head distribution along a horizontal Venturitube.
b. To compare experimental results with theoretical results.
c. To measure the meter coefficient of discharge at various flow rates.

4. To study discharge over a notch. **[6]**

a. To investigate head against discharge over a notch.

5. To study friction loss in pipe . **[8]**

a. To investigate laminar and turbulent flow in pipe. .
b. To verify Poiseulle's Equation and the coefficient of viscosity for water in the laminar flow region.
c. To demonstrate and measure the change in friction factor from laminar to turbulent.

ME 14.216 **Design of Machine Elements Practice -I** **Total Hours: 24**
Credit: 0-0-2-1

List of Experiments

1.	Design and drawing of a cotter joint, knuckle joint, hooke's joint	**[4]**
2.	Application of theories of failure to design machine members subjected to combined loadings	**[2]**
3.	Design of machine elements against fluctuating loads.	**[2]**
4.	Design and drawing of rigid and flexible couplings.	**[4]**
5.	Design and drawing of a riveted joint & welded joint	**[4]**
6.	Design and drawing of threaded joints.	**[4]**
7.	Design and drawing of power screws.	**[2]**
8.	Design and drawing of springs.	**[2]**

ME 14.301 **Dynamics of Machines** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): ME 14.101, ME 14.202

Objective(s):

- *Understand Kinematics and Dynamics of different machines and mechanisms.*
- *To facilitate students to understand the function of flywheels, the concept of balancing of rotating and reciprocating masses.*
- *To understand the principles in mechanisms used for governing of machines*
- *To give awareness to students on the phenomenon of vibration and its effects.*

1. **Static and Dynamic force analysis:** Constraint and applied forces, static Equilibrium of two and three forces members, principle of virtual work, friction in mechanisms. Dynamic analysis of 4-bar linkage and slider-crank mechanism, velocity and acceleration of a piston, angular velocity and angular acceleration of connecting rod, Engine force analysis, Dynamically equivalent system, inertia of connecting rod, Inertia force in reciprocating engine, crank shaft torque. **[10]**
2. **Engine dynamics and flywheel:** Turning moment diagram of an I. C engine, Fluctuation of crankshaft-speed, flywheel and its effect on cyclic fluctuation of speed of an engine. **[4]**
3. **Balancing:** Static balancing & dynamic balancing, Balancing of several masses, rotating in different planes, Balancing of reciprocating mass, Balancing of in-line engine, Balancing of V-engines, Balancing of radial engines. **[8]**
4. **Governors:** types of governors, analysis of Watt, Porter , Prowell, Hartnell, Hartung governor, Sensitiveness of a governor, hunting, isochronisms and stability of a governor, effect and power of a governor, effect of friction on dynamics of governor. **[8]**
5. **Gyroscope:** Angular velocity, angular acceleration and gyroscopic torque, gyroscopic effect on aeroplanes, naval ships, two wheelers and four wheelers. **[4]**
6. **Mechanical Vibrations:** Types of vibrations, Single degree free & damped vibrations, Logarithmic decrement, Forced vibration of single degree system under harmonic excitation, vibration isolation. **[6]**

Outcome(s):

- *Students will have an understanding of static force relationships and inertia forces and their effect that exist in machines.*
- *Students will demonstrate the dynamics of flywheel and their motion.*
- *Analyse balancing of rotating masses in a single and several planes.*
- *Understand concepts of vibrations in various machineries, their harmful effects and remedies*

Text Books:

1. Shigley J. E and Uicker J. J, "Theory of Machines and Mechanisms", McGraw Hill, Inc., Latest Edition.
2. Rattan S. S, "Theory of Machines", Tata McGraw Hill Publishing Company Ltd., New Delhi, Latest Edition.

Reference Books:

1. Thomas B, "Theory of Machines", CBS Publishers and Distributors, Latest Edition.

2. Ghosh A and Mallick A. K, “Thoery of Mechanisms and Machines”, Affiliated East-West Pvt. Ltd., New Delhi, Latest Edition.
3. Bhave S., “Mechanical Vibration”, Pearson India Ltd., Latest Edition

ME14.303 **Design of Machine Elements -II** **Total Lecture 52**
Credit: 4-0-0

Prerequisite(s) ME14.101, ME 14.201, ME 14.206

Objective(s)

- *Develop an ability to apply knowledge of mathematics, science, and engineering*
- *To develop an ability to design a system, component, or process to meet desired needs within realistic constraints.*
- *To develop an ability to identify, formulate, and solve engineering problems.*
- *To develop an ability to use the techniques, skills, and modern engineering tools necessary for engineering practice.*

1. **Design of Gears:** Different types of gears – spur, helical, bevel and worm gears, Beam strength, wear strength, dynamics loads on gears, estimation of module based on beam strength and wear strength, Thermal consideration design of worm gears. **[14]**
2. **Friction Clutches:** Different types of clutches, torque transmitting capacity for multidisc clutches, cone clutches, centrifugal clutches, Friction materials for clutches lining, energy equation and thermal considerations. **[6]**
3. **Brakes:** different types of brakes, Energy equations, Design of block brake, Design of band brake, Design of disc brake, Thermal consideration. **[6]**
4. **Rolling Contact Bearings:** Types of rolling contact bearings, Selection of bearing type, Static load carrying capacity, Equivalent bearing load, Load life relationship, selection of bearing life, Selection of bearing from manufacture's catalogue, Selection of taper roller bearings, Design of cyclic loads and speeds lubrication of bearing contact bearings, Mounting of bearings. **[3]**
5. **Sliding Contact Bearing:** Basic mode of lubrication, Petroff's equation, Mckee's Investigation, Reynold's equation, Raimondi Boyd method, Bearing design-selection of parameters, Bearing materials and construction, selection of lubricant. **[6]**
6. **Miscellaneous Machine Elements:** Engine crank shaft, connecting rod, cylinder head, pressure vessels. **[5]**

Outcome(s)

- *Be able to analyze the stress and strain on mechanical components; and understand, identify and quantify failure modes for mechanical parts.*
- *Demonstrate knowledge on machine elements used in machine design; design machine elements to withstand the loads and deformations for a given application, while considering additional specifications.*
- *Be able to approach a design problem successfully, taking decisions when there is not a unique answer.*

Text Books:

1. Bhandari V. B, "Design of machine elements", Tata McGraw Hill Publication, Latest Edition.
2. Shigley J. E, "Machine Engineering Design", Tata Mc Graw Hill Publication, Latest Edition.

Reference Books:

1. Norton R. L, "Machine design – An Integrated Approach", Tata McGraw Hill Publication, Latest Edition

ME 14.305 **Heat and Mass Transfer** **Total Lectures: 40**

3-1-0-4

Prerequisite(s): MA 14.201,ME 14.203, ME 14.204

Objective(s):

- *Identify and understand the various mechanisms of heat and mass transfer that characterize a given physical system.*
- *Formulate models for heat conduction processes. Apply analytical and numerical methods to solve one- and two-dimensional conduction problems.*
- *Analyze and design complex heat transfer applications, such as heat exchangers.*
- *Combine thermodynamics and fluid mechanics principles to analyze heat convection processes.*
- *Integrate radiation aspects into real-world global heat transfer problems.*

1. **Basics Concepts:** Heat transfer in engineering, Mechanisms of heat transfer, temperature field and temperature gradient, conduction, convection and radiation heat transfer, concept of driving potential, combined mechanism of heat transfer. **2**

2. **Fundamental equations of conduction:** General different equation of heat conduction in Cartesian, cylindrical and spherical coordinate system, one dimensional steady state heat conduction, systems without internal heat generation, systems with variable thermal conductivity, composite systems, critical radius of insulation, Special one dimensional steady state situations – **heat generation, pin fins** **6**

3. **Multidimensional steady state conduction:** Introduction, Mathematical analysis of 2-D systems, graphical analysis of 2-D systems, electrical analogy for 2-D systems, Numerical method of solution for 2-D systems, three dimensional systems. **6**

4. **Transient heat conduction:** Introduction, systems with negligible internal resistance – lumped parameter method, systems with negligible surface resistance, heat flow in an infinitely thick plate, systems with finite surface and internal resistance. **5**

5. **Fundamental of convective heat transfer:** Introduction, convective heat transfer coefficient, basic equation, boundary layer concept, laminar heat transfer over flat plate, fully developed heat transfer through smooth pipes, the case of contact heat flux and constant wall temperature boundary condition, dimensional analysis, Correlation of heat transfer in turbulent flow, use of hydraulic diameter, free convection heat transfer phenomena, heat exchangers, Log mean temperature difference, Effectiveness and NTU. **9**

6. **Thermal Radiation:** Basic concept, Theory of thermal radiation, electromagnetic spectrum, Wien's displacement law, Stefan-Boltzmann equation, Concept of black gray bodies without participating media, radiation shields, View factors, Equivalent emissivity of grooved surfaces electrical network analogies. **9**

7. **Mass Transfer**: Analogy between heat and mass transfer, mass diffusion, Fick's law of diffusion, boundary conditions, steady mass diffusion through a wall, transient mass diffusion, mass convection, limitations of heat and mass transfer analogy. **3**

Outcome(s): *Upon successful completion of this course, the student will be able to:*

- *Understand the basic laws of heat transfer.*
- *Analyze problems involving steady state heat conduction in simple geometries.*
- *Develop solutions for transient heat conduction in simple geometries.*
- *Understand the fundamentals of convective heat transfer process.*
- *Evaluate heat transfer coefficients for natural & forced convection.*
- *Analyze heat exchanger performance by using the method of log mean temperature difference.*
- *Analyze heat exchanger performance by using the method of heat exchanger effectiveness.*
- *Calculate radiation heat transfer between black body surfaces.*
- *Calculate radiation heat exchange between gray body surfaces.*

Text Books:

3. Nag P. K, "Heat & mass transfer", TMH, Latest Edition.

4. Holman J. P, "Heat Transfer (in SI units)", TMH, Latest Edition.

Reference Books:

4. Sachdeva R. C, "Fundamentals of Engineering Heat and Mass Transfer", New Age International Publishers, Latest Edition.

5. Fundamental of Heat and Mass Transfer by Incropera and Dewitt, Wiley Publication

6. Heat and Mass Transfer: Fundamentals and Application by Yunus Cengel, McGraw Hill

ME 14.307 **Fluid Machinery** **Total Lectures: 40**

Credit 3-0-0-3

Prerequisite(s): ME 14.204

Objective(s): *This course deals with the fluid dynamics and thermodynamics to various kinds of fluid machineries. The objectives of the course is to enable the student;*

- *To impart the knowledge on pumps and turbines.*
- *To understand the basic principles of pneumatics and hydraulics.*
- *To identify pneumatic and hydraulic components and their functions*
- *To understand different types of turbine and its applications.*
- *To compute the efficiency of different types of turbine and pumps.*

1. **Introduction:** Introduction, Application of momentum and momentum equation to flow through hydraulic machinery, Euler's fundamental equation. **[2]**
2. **Impact Of Jet:** Introduction to hydrodynamic thrust of jet on a fixed and moving surface (flat & curve), effect of inclination of jet with the surface. **[4]**
3. **Hydraulic Turbines:** Classification of turbines, Impulse turbines, constructional details, velocity triangles, power and efficiency calculations, governing of Pelton wheel. **[7]**
4. **Reaction Turbines:** Fransis and Kaplan turbines, constructional details, velocity triangles, power and efficiency calculations, degree of reaction, draft tube, cavitation in turbines, principles of similarity, unit and specific speed, performance characteristics, selection of water turbines. **[7]**
5. **Centrifugal Pumps:** Classifications of centrifugal pumps, vector diagram, work done by impellor, efficiencies of centrifugal pumps, specific speed, model testing, cavitation and separation, performance characteristics. **[7]**
6. **Positive Displacement Pumps:** Reciprocating pump theory, slip and coefficient of discharges, indicator diagram, effect and acceleration, work saved by fitting air vessels, comparison of centrifugal and reciprocating pumps, positive rotary pumps, Gear and Vane pumps, performance characteristics. **[8]**
7. **Other Machines:** Hydraulic accumulator, Intensifier, Hydraulic press, Lift and Cranes, theory of hydraulic coupling and torque converters, performance characteristics, Hydraulic ram, Jet pumps, Airlift pumps. **[5]**

Outcome(s):

- *Able to identify hydraulic problem.*
- *Able to learn any possible improvements on fluid machinery.*
- *Able to compute efficiency of various fluid machineries.*

Text Books:

1. Lal J, "Hydraulic Machines", Metropolitan book co. Pvt Ltd , New Delhi, Latest Edition.
2. Vasandhani V. P, "Hydraulic Machines: Theory & Design", Khanna Pub, Latest Edition

Reference Books:

1. Sayres A. T, "Hydraulic and Compressible Flow Turbomachines", TMH, Latest Edition
2. Sawhney G. S. "Thermal And Hydraulic Machines", PHI, Latest Edition

ME 14.311 **Design of Machine Element Practice II** **0-0-2-1**

List of Experiments

1. To design and draw according to data given Spur Gears. [2]
2. To design and draw according to data given Helical Gears. [2]
3. To design and draw according to data given Bevel Gears. [2]
4. To design and draw according to data given Worm Gears. [2]
5. To design and draw according to data given Friction Clutch. [4]
6. To design and draw according to data given different types of brakes. [4]
7. Selection and drawing of Rolling Contact Bearings. [2]
8. Design of Sliding Contact Bearings. [2]
9. Design and drawing of Crankshaft and Connecting Rod. [4]

ME 14.313 **Fluid Machinery Laboratory** **0-0-2-1**

List of Experiments

1. To study and determine the performance characteristic of a Pelton wheel. [6]

    a. To plot a graph between inlet pressure, flow rate, torque and power against speed for a set of nozzle opening.
    b. To analyze the plotted graph between inlet pressure, flow rate, torque and power against speed for a set of nozzle opening.
    c. To determine the overall conversion efficiency of fluid to mechanical energy, over a range of condition.
    d. To compare experimental results with theoretical results

2. To study and determine the performance characteristics of Francis Turbine [6]

    a. At different flow rates
    b. At different guide vane setting
    c. To determine the overall conversion efficiency of fluid to mechanical energy
    d. To compare experimental results with theoretical results

3. To study and determine the performance characteristics of Centrifugal Pump. [6]

    a. To plot a graph between head v/s flow.
    b. To plot a graph between efficiency v/s flow
    c. To study non dimensional characteristics
    d. To demonstrate Cavitations

4. To study and determine the performance characteristics of Positive displacement pumps [6]

    a. Piston pump
    b. Gear pump
    c. Vane pump
    d. Swash plate pump

ME 14.302 **Computational Methods** **Total Lectures: 40**

Credit-3-0-0-3

Prerequisite(s): Engineering Mathematics

Objective(s):

- *To solve linear systems of equations using Gaussian elimination and Gauss-Seidel iteration.*
- *To use bisection and Newton-Raphson techniques to find approximate roots of non-linear equations, and analyse the errors.*
- *To calculate approximate derivatives and finite integrals;*
- *To apply numerical techniques to solve ordinary differential equations*

1. **Solution of algebraic and transcendental equations:** fixed point iterative methods; method of iteration, order of convergence, method of bisection, regulai-falsi method, Newton-Raphson method. Roots of polynomial equation by Lobachevsky-Graeffe's method, Bairstow's method Solution of system of nonlinear equations by Newton-Raphson's method. [8]
2. **Solution of system of linear algebraic equations:** Direct methods – Gaussian elimination method, Gauss Jordan method, LU decomposition technique (Doolittle's and Crout's method), Cholesky decomposition for symmetric matrices, matrix inversion. Ill conditioned systems – condition index and condition number. Iterative methods – Gauss Seidel method, convergence of the iterative method. [8]
3. **Numerical Integration and Differentiation:** Trapeziodal, Simpson's and Romberg's methods. Degree of precision, Newton Cotes formula, composite forms, Gaussian quadrature using Legendre polynomials. [8]
4. **Curve fitting and interpolation:** Linear regression, Matrix formulation of the least square procedure for linear forms. Weighting for least square method, curve fitting with polynomials, Fourier series and exponential function. Interpolation; curve fitting and interpolation with a cubic spline. [6]
5. **Numerical solution of ODE:** solution of initial value problems by single-step and multi-step methods – Runge-Kuttamethod, Adam-Bashforth-Moulton and Millne's method. Solution of boundary value problem–Finite Difference method. Numerical solution of PDE: methods of finite difference and relaxation technique for solving elliptic and hyperbolic equations. [10]

Outcome(s):

- *Students are able to understand the different numerical methods to solve the algebraic equations and to solve system of linear and nonlinear equations*
- *An ability to apply knowledge of math, science, and engineering to the analysis of heat transfer and fluid mechanics problems.*
- *An ability to identify, formulates, and solves mechanical engineering problems.*
- *An ability to work on multidisciplinary projects*

Text Books:

1. Ghosh P, "Numerical Methods with Computer Programs in C++", PHI, Latest Edition.
2. Grewal B. S, "Numerical Methods in Engineering & Science (Programs in C, C++, Introduction to MATLAB)", Khanna Publishers Latest Edition.

Reference Books:

1. Sastry S. S, "Introductory Methods of Numerical Analysis", PHI Learning Private Limited, Fourth Edition, 2005.

ME 14.304 **I C Engines** **Total Lectures: 40**

Credit 3-1-0-4

Prerequisite(s): ME 14.203, ME 14.204, ME 14.305

Objective(s):

- *To teach students the fundamentals, operations, and performance of internal combustion engines and their different types.*
- *To provide students with the theoretical and experimental ability to operate, analyse, and design internal combustion engines.*
- *To study the thermodynamics, combustion, heat transfer, friction and other factors affecting engine power, efficiency and emissions*

1. **Introduction to I C Engine:** Two and four stroke engines, SI and CI engines, Valve timing diagram, Rotary engines, Stratified charge engine, Scavenging in 2 Stroke engines. **3**
2. **Spark Ignition Engines:** Spark ignition engine mixture requirements, Carburetion, Theory of carburetor, SP and MPFI, Combustion in SI engine, Flame speed, Ignition delay, Abnormal combustion and it's control, combustion chamber design for SI engines. **6**
3. **Compression Ignition Engines:** Combustion in CI engine, Ignition delay, Knock and its control, Combustion chamber design of CI engine, Turbocharging, Supercharging. **6**
4. **Engine Systems and Components:** Ignition systems- Battery, Magneto and Electronic, Lubrication systems, Engine starting system, Engine cooling system, Intake and exhaust system, Drive train- Cam shaft and Valves. **7**
5. **Pollutant Formation Control:** Pollutant, Sources and types, Nox formation, Hydrocarbon emission mechanism, Carbon monoxide formation, Particulate emissions, Effect of pollutant, Emission standards, Catalytic converters and particulate traps, Method of measurement **7**
6. **Alternate Fuels:** Methanol, Ethanol, Hydrogen, Natural gas, Biogas, Bio diesel, Liquefied petroleum gas, Properties, suitability, Engine Modifications, Merits and Demerits. **5**
7. **Performance Characteristic and Testing of I C Engine:** Standards for testing of I.C. Engine, Mean effective pressure, Mean effective pressure, indicated power, brake power, friction power, Methods to determine power and efficiencies, Variables affecting performance of engine, characteristic curves, heat balance sheet, Methods of improving engine performance. **6**

Outcome(s): *Upon successful completion of this course, the student will be able to:*

- *Demonstrate a basic understanding of different types of internal combustion engines and their operations.*
- *To analyze the ideal models of engine cycles.*
- *To understand the effect of supercharging and turbocharging on engine performance.*
- *To understand fuel-metering systems: carburetors and fuel injectors, in SI and CI engines.*

Text Books:

1. Ganesan V, "Internal combustion Engines", Tata McGraw Hill Pub. Co. Ltd., 3rd Edition, 2007.
2. Heywood John B, "Internal combustion Engines Fundamentals", McGraw Hill, Latest Edition.

Reference

1. Mathur M. L and Sharma R. P, "Internal Combustion Engines", Dhanpat Rai & Sons, Latest

Books:

Edition.

2. Pulkrabek W. W, “Engineering Fundamentals of the Internal Combustion Engine”, PHI Learning Private Limited, Latest Edition.

ME 14.306 **Production Technology-II** **Total Lectures: 40**

Credit: 3-0-0-3

Prerequisite(s): ME-14.205, ME14.112

Objective(s):

- *To understand the basic principles of metal forming, welding and casting processes*
- *To know the various types of melting practices*
- *To broaden the understanding of casting design principles*

1. **Metal Forming:** Nature of plastic deformation, stress-strain relation inelastic and plastic deformation, concept of flow stress, deformation mechanism, hot and cold working, rolling principal, rolling stand arrangement, roll passes, sheet metal working processes bending, bend force, , press work tool and types of dies. **[12]**
   Forging, Extrusion and other Processes: Forging operations, forging design, drop forging die design, die inserts; Extrusion-principle, forward and backward extrusion, impact extrusion, hydrostatic extrusion, extruding tubes Wire drawing- rod and tube drawing, tube making, swaging.
2. **Metal Fabrication Process:** introduction to fabrication process, gas welding and cutting. Electric arc welding-principle of arc, arc welding equipment, electrodes, carbon arc welding, TIG GMAW, SAW, arc cutting Resistance welding: principle –spot, seam, projection, upset, flash welding Other welding process: Thermit welding, electro slag welding, EBW, laser beam welding, forge welding, friction welding, diffusion welding, explosion welding, Welding design: heat input, heat flow, distortion, metallurgy of welding, defects in welding, brazing, braze welding and soldering **[14]**
3. **Metal Casting Process:** Introduction-advantages and limitations-applications-casting termsPatterns: Pattern allowance-pattern materials-types of patterns- colour codes Moulding materials: Moulding sand composition-testing sand properties-sand preparation-moulding sand properties-types of sand moulds-moulding machines Cores: Core sand, types of cores, core prints, chaplets, forces acting on the moulding flasksGating system: Elements of gating system, gates, pouring time, sprue, gating ratio, slagtrap system, risering design-caine's method, modulus method, chills-feeding aids. **[14]**

Outcome(s):

- *Student will be able to*
- *Choose forming techniques for various applications*
- *Develop welding techniques for various alloys*
- *Develop welding application concepts*
- *Develop suitable casting techniques for specific applications*
- *Design of gates and risers in castings*

Text Books:

1.Rao P. N, "Manufacturing Technology", Tata McGraw-Hill, Latest Edition.
2.Lindberg Roy A, "Processes and Materials of Manufacture", Fourth edition PHI Latest Edition.

Reference Books:

1. Ostwald P. F, "Manufacturing Processes and Systems", John Wiley and Sons, ninth edition 1998.
2. Kalpakjian, S. and Steven R. Schmid , Manufacturing, Engineering & Technology, Pearson
3. Mikell. P. Grover, Fundamentals of Modern Manufacturing, Pearson Publications

ME 14.308 **Metrology & Quality Control** **Total Lecture: 40**
Credit: 3-0-0-3

Prerequisite(s) ME 14.215

Objective(s):

- *Describe various instruments and their characteristics.*
- *Solve the problems on angle measurements.*
- *Explain the types of control chart to use, depending on given data.*
- *Solve problems based on quality control and acceptance sampling*.

1. **Introduction to Metrology:** Need – Elements – Work piece, Instruments – Persons – Environment – their effect on Precision and Accuracy – Errors – Errors in Measurements. [4]
2. **Linear and Angular Measurements:** Linear Measuring Instruments – Vernier micrometers, Limit gauges, height and depth gauge as per Indian standards ,Limit gauges – terminology – procedure – concepts of interchange ability and selective assembly – Angular measuring instruments – Types – Bevel protractor ,clinometers, angle gauges, spirit Levels, sine bar – Angle alignment telescope – Autocollimator – Applications. [8]
3. **Form Measurement:** Principles and Methods of straightness – Flatness measurement – Thread measurement, Gear measurement, Interferometry, Types of Interferometer, Flatness, Roundness measurement - Applications. Control Gauges and Comparators. Surface texture measurement with stylus type instruments, Tomlinson surface meter, Talysurf and profilograph. [8]
4. **Advances in Metrology:** Straightness – Alignment, Basic concept of CMM –Types of CMM – Constructional features – Probes – Accessories – Software – Applications –Basic concepts of Machine Vision System – Element – Applications. [4]
5. **Quality Control:** Concept of Quality and quality control, elements of quality & its growth, purpose, setup, policy & objective, factors controlling & quality of design and conformance, balance between cost and quality and value of quality. Specification of quality, planning through trial lots and for essential information [5]
6. **Statistical Quality Control:** Importance of statistical method in quality control, measuring of statistical control variables and attributes. Measurement/inspection, different types of control charts (X Bars, R, P. charts) and their constructions and their application. [6]
7. **Acceptance Sampling:** Sampling inspection & percentage inspection, basic concept of sampling inspection, operating characteristic curves, conflicting interests of consumer and producer, producer and consumers risks, AWQL, LTPD, ADGL, single and double sampling plans. [5]

Outcome(s): *After successful completion of this course the student will be able to:*

- *Make various comparative measurements.*
- *Understand fundamentals of gears, thread measurements and measurements of surface finish.*
- *Control chart techniques in quality control.*
- *Purpose and use of sampling and its benefit*.

Text Books:

1. Metrology and Measurement, Anand Bewoor & Vinay Kulkarni McGraw – Hill
2. Statistical quality Control – Mahajan M., Dhanpat Rai & Sons, Delhi.

Reference Books:

1. Jain R. K, "Engineering Metrology", Khanna Publishers, Latest Edition.
2. Gupta I. C, "Engineering Metrology", Dhanpatrai Publications, Latest Edition
3. Shotbolt, "Metrology for Engineers, McGraw Hill, Latest Edition.
4. Dale H. Besterfield, Carol Besterfield-Michna, Glen H. Bester field and Mary Besterfield, "Total Quality Management", 3rd Edition; Pearson Education.
5. Montgomery, Introduction to Statistical Quality Control, John Wiley and Sons (2005).

ME 14.320 **Optimization Methods in Engineering Design** **Total Lectures 40**
Credit 3-1-0-4

Prerequisite(s) ME 14.101

Objective(s)

- *Demonstrate an understanding of how design optimization fits into the overall design process.*
- *Learn how to formulate practical engineering design problems as well-posed optimization problems.*
- *Understanding continuous optimization theory for problem formulation and system modeling*
- *Develop a detailed understanding of numerical methods for optimization through implementation in MATLAB*

1. **Introduction to Design Optimization:** Design Process, conventional v/s optimum design, Optimum design v/s optimal control. [2]

2. **Optimum Design Problem formulation**: The problem formulation process with examples, General Mathematical model for optimum Design. [4]

3. **Graphical Optimization and Basic Concept**: Graphical solution process, Use mathematical and MATLAB for Graphical optimization, Design problem with multiple solutions. [6]

4. **Optimum Design Concepts:** Local and Global minima, Optimality Conditions- Unconstrained problem, Optimality Conditions for functions of single variable and for functions of several variables, Necessary conditions for equality constrained problems, Lagrange multiplies, Necessary condition for a general constrained problem, Karush-kuhn – tucker necessary condition, Global optimality- Convex sets, convex functions, convex programming problems, Engineering design Examples [6]

5. **Numerical Methods for continuous Variable Optimization:** Classification of search methods, simple scaling of variables, Excel solver for unconstrained optimization problems, Excel solver for nonlinear programming, optimum design examples with MATLAB. [5]

6. **Linear programming methods for optimum design:** Linear functions, Standard linear programming problems, optimum solution to L.P. problems, calculation of basic solutions, simplex method, Duality in linear programming, KKT conditions for LP problems. [6]

7. **Numerical method for unconstrained optimum Design:** Gradient- based and Direct search methods, step size determination, Numerical method to determine slip size, search direction determination, other conjugate gradient methods. [6]

8. **Numerical Methods for constrained optimum Design:** Basic concepts, Constrains Status at a design point, Constraint Normalization, The descent function, Linearization of the Constrained problem, sequential linear programming algorithm, Sequential quadratic programming, the constrained steepest descent method. [5]

Outcome(s)

- *Model and formulate optimization problems in standard form and assess the optimality of a solution.*
- *Construct computer programs to determine the optimal solution for unconstrained and constrained nonlinear optimization problems of multiple variables.*
- *Determine the advantages and disadvantages of applying different optimization techniques for a specific problem.*
- *Model and analyze multiobjective and multidisciplinary optimization problems.*

Text Books:

1. Arora, J. S, "Introduction to Optimum Design", McGraw-Hill, Latest Edition.
2. Rao S. S, "Engineering optimization: Theory and practice", John Wiley & Sons Inc, Latest Edition.

Reference Books:

1. Vanderplaats G. N, "Numerical Optimization Techniques for Engineering Design", McGraw-Hill, Latest Edition.
2. Miller, R. E, "Optimization: Foundations and Applications", John Wiley & Sons Inc, Latest Edition.
3. Fletcher R, "Practical Methods of Optimization", Wiley, Latest Edition.
4. Gill P. E, Murray W., & Wright M., "Practical Optimization", Academic Press, Latest Edition.
5. Nocedal J & Wright S. J, "Numerical Optimization", Springer-Verlag Latest Edition.

ME 14.322 **Vibration Engineering** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): ME 14.301, MA 14.201

Objective(s):

- *Formulate mathematical models of problems in vibrations using Newton's second law or energy principles.*
- *Perform detailed analysis of the response of one and two degree of freedom systems in both free and forced vibration regimes.*
- *Explain the interaction of mechanical vibrations with humans.*
- *Perform vibration design of simple mechanical systems that can be approximated by one, two, or infinite degree of freedom systems.*

1. **Introduction:** Basic Concept, Classification of vibrations and vibrating systems, Oscillating motion like harmonic motion, periodic motion and vibration terminology. **2**
2. **Free vibration of single degree-of-freedom system:** Vibration model, Equation of motion, natural frequency, viscously damped free vibration, Logarithmic decrement, Coulomb damping. **10**

   Harmonically forced vibration of single degree-of-freedom system: Forced harmonic vibration, vibration isolation, rotating unbalance, whirling of rotating shaft, support motion, Structural damping.
3. **Two Degree Freedom systems:** Introduction, Principal modes, Double pendulum, Torsional system with damping, coupled system, undamped dynamic vibration absorbers **6**
4. **Multi-degree-of-freedom system:** Free vibration of undamped systems, Torsional systems, Co-ordinate coupling and principal Co-ordinates, forced vibration of damp free and damped systems **8**
5. **Numerical technique to find Natural frequencies:** Rayleigh's method, Horzer's method, Matrix Iteration method, energy method. **8**
6. **Vibration analysis of continuous system:** Transverse vibration of strings, longitudinal vibration of rods, Torsional vibration of shafts, transverse vibration of beams. **6**

Outcome(s):

- *Ability to analyze the mathematical model of a linear vibratory system to determine its response.*
- *Ability to solve for the motion and the natural frequency for free and forced vibration of a single degree of freedom damped or undamped system.*
- *Ability to obtain linear mathematical models of real life engineering systems*
- *Ability to solve vibration problems that contain multiple degrees of freedom.*

Text Books:

1. S.Bhave, Mechanical Vibration, Pearson India Ltd., Latest Edition.
2. G. K. Groover, Mechanical Vibrations, Jain Brothers, Roorkee.

Reference Books:

1. S. S. Rao, Mechanical Vibrations, Pearson-Prentice Hall, Latest Edition.
2. T. Thomson, M.D. Dahleh, P. Chandramouli, Theory of vibration with application, PHI Latest Edition.

ME 14.324 **Advanced Metal Casting & Welding** **Total Lectures: 40**

Pre – requisites: *ME 14.306* **Credit: 3-1-0-4**

Objective:

- *To make the students understand the concepts of advance casting technique.*
- *To make the students understand the concepts of advance welding technique.*
- *To make the students understand the principles and operations of special and modern welding processes*

1. **Advanced Casting :** Processes, parameters and applications of Investment Casting, Continuous Casting, Centrifugal casting, Carbon dioxide molding, Shell Moulding, Gravity die/ permanent mold casting, pressure die casting, Resin bonded casting , plaster mold casting, Vaccum Casting, Full Mould Casting, Slush Casting, Non metal Molding /Ceramic Molding. [10]

2. **Inspection and Testing of Casting:** Defects in Casting, its causes and remedies, Inspection and Destructive and nondestructive Testing of Casting including. [4]

3. **Advanced Welding Technique-I:** Electron Beam Welding- Background of the Process, Weld Environment, Welding in Different Degrees of Vacuum, Equipment and Safety, Joint Design, Applications, Laser Beam Welding, Process Parameters, Applications and Limitations. Plasma arc welding: Theory and Principles, Transferred arc and Non-Transferred arc Techniques, Equipment and Tooling, Joint Design Advantages, Disadvantages. [10]

4. **Advanced Welding Technique-II**: Ultrasonic Welding; Propagation of ultrasonic waves in matter, mode of joint formation, joint types and design of product for ultrasonic welding, details of equipment. Friction Welding- Basic Principles, Process Variants, Different Stages of Friction Welding, Mechanism of Bonding, Influence of Process Parameters, Weld Quality and Process Control, Joining of Dissimilar Materials, Advantages, Limitations and Applications. Diffusion Welding- theory and Principle of Process, Key Variables, Intermediate Materials, Deformation Welding, Equipment and Tooling. [10]

5. **Thermal and Metallurgical Consideration.** Thermal considerations for welding, temperature distribution, Analytical analysis, heating & cooling curves. Metallurgical consideration of weld, micro & macro structure. Solidification of weld and properties. [6]

Outcome: *Student will be able to*

- *Develop advanced casting techniques for various alloys*
- *Develop advanced welding techniques*
- *Develop welding application concepts*

Text Books:

1. Khanna O.P., "Foundry Technology", Latest Edition, Dhanpat Rai *Publication*

2. Khanna O.P., "Welding Technology", Latest Edition, Dhanpat Rai *Publication*

3. Howard B Cary, " Modern Welding Technology" Prentice Hall, 2002

Reference Books:

1. Richard L Little, “Welding and Welding Technology” Tata McGraw Hill, 2004.
2. Kalpakjian, S. and Steven R. Schmid , Manufacturing, Engineering & Technology, Pearson
3. Mikell. P. Grover, Fundamentals of Modern Manufacturing, Pearson Publications

ME 14.326 **Power Plant Engineering** **Total Lectures: 40**

Credit 3-1-0-4

Prerequisite(s): ME 14.203, ME 14.204

Objective(s):

- *Basic knowledge of Different types of Power Plants, site selection criteria of each one of them.*
- *Understanding of Thermal Power Plant Operation, turbine governing, different types of high pressure boilers including supercritical and supercharged boilers, Fluidized bed combustion systems.*
- *Basic knowledge of Different types of Nuclear power plants including Pressurized water reactor, Boiling water reactor, gas cooled reactor, liquid metal fast breeder reactor.*
- *Understanding of Power Plant Economics, Energy Storage including compressed air energy and pumped hydro etc.*
- *Discussing environmental and safety aspects of power plant operation.*

1. **Introduction:** Power and energy, sources of energy, review of thermodynamic cycles related to power plants, fuels and combustion, calculations. Variable Load problem Industrial production and power generation compared, ideal and realized load curves, terms and factors. Effect of variable load on power plant operation, methods of meeting the variable load problem, Power plant economics and selection, Effect of plant type on costs, rates, fixed elements, energy elements, customer elements and investor's profit; depreciation and replacement, theory of rates. Economics of plant selection, other considerations in plant selection. **8**
2. **Steam Power Plant:** General layout of steam power plant. Different systems such as fuel handling system, pulverizes and coal burners, combustion system, draft, ash handling system, feed water treatment and condenser and cooling system, turbine auxiliary systems such as governing, feed heating, reheating flange heating and gland leakage. Operation and maintenance of steam power plant, heat balance and efficiency. **8**
3. **Hydro Electric Power Plant:** Hydrology: rainfall, runoff, hydrographs, flow duration curves; Site selection for hydro power plants; Classification of hydro power plants; Storage type hydro power plant and its operation; Estimation of power availability; Selection of water turbines; Combination of hydro power plants with steam plants; advantages and disadvantages of hydro power points. **8**
4. **Internal and External Combustion Engine Power Plants:** General layout, performance of diesel engine, Diesel plant operation and efficiency, Gas turbine power plant, Elements of gas turbine power plants, Gas turbine fuels, cogeneration, auxiliary systems such as fuel, controls and lubrication, operation and maintenance, Combined cycle power plants. **8**
5. **Nuclear Power Plant:** Basic theory and terminology; Nuclear fission and fusion processes; Fission chain reaction; Moderation; Fertile materials; Nuclear fuels; General components of nuclear reactor; Different types of reactors; Breeder reactors; Nuclear power plants in India; Disposal of nuclear waste. **8**

Outcome(s): *After taking this course the students should be able to:*

- *Select the suitability of site for a power plant.*
- *Calculate performance of thermal power plant.*
- *Propose ash handling, coal handling method in a thermal power plant.*
- *Explain working principle of different types of nuclear power plant.*
- *Calculate load factor, capacity factor, average load and peak load on a power plant.*
- *Indicate safety aspects of power plants.*

Text Books:

1. Nag P. K, “Power Plant Engineering”, Tata McGraw Hill Publishing Company Ltd., New Delhi, Latest Edition.
2. Yadav R, “Power Plant Engineering”, Central Publishing House, Latest Edition.

Reference Books:

1. El Wakil M. M, “Power Plant Engineering”, McGraw Hill Latest Edition
2. Bernhardt G. A. S & William A. V, “Power station Engineering and Economy”, Tata Mc Graw Hill Publishing Company Ltd., New Delhi, Latest Edition.

ME 14.328 **Turbomachinery** **Total Lectures: 40**

3-1-0-4

Prerequisite(s): 14.204

Objective(s):

- *Teach students how to apply various understandings from other courses;*
- *Provide students with opportunities to apply basic flow equations;*
- *How to compare and chose machines for various operations*.

1. **Introduction:** Basic law and equations, dimensional parameters and their physical significance and specific speed. **5**
2. **Energy Transfer in Turbomachine:** General analysis of a turbomachine, energy transfer between fluid and rotor, degree of reaction. **7**
3. **Centrifugal Fans and Blowers:** Types, stage and design parameters, flow analysis in impeller blades, volute and diffusers, losses, characteristic curves and selection, fan drives and fan noise. **8**
4. **Centrifugal Compressor:** Construction details, impeller flow losses, slip factor, diffuser analysis, and losses, performance curves. **6**
5. **Axial Flow Compressor:** Stage velocity diagrams, enthalpy-entropy diagrams, stage losses and efficiency, work done, simple stage design problems and performance characteristics.[**8**
6. **Axial and radial flow turbines:** Stage velocity diagrams, reaction stages, losses and coefficients, blade design principles, testing and performance characteristics. **6**

Outcome(s): *Upon successful completion of this course, the student will be able to:*

- *Classify and explain the function of dimensionless number;*
- *Design Prototype from Model;*
- *Select Fluid Machines for Appropriate Operations;*
- *Applications of Thermodynamics Laws.*

Text Books:

1. Yahya S.H., Turbines, "Compressor and Fans", TMH, Latest Edition.
2. Venkanna B. K., "Fundamentals of Turbomachines", PHI Learning Private Limited, Latest Edition.

Reference Books:

1. Dixon S.I, "Fluid Mechanics and Thermodynamics of Turbomachinery", Pergamon Press, Latest Edition.
2. Shepherd, D.G, "Principles of Turbomachinery", Macmillan, Latest Edition.
3. Mattingly J, "Elements of Propulsion: Gas Turbines and Rockets", Addison-Wesley *Publishing* Company, Latest Edition.
4. Cohen H, Saravanamuttoo H. I. H, Rogers G.F.C., "Gas Turbine Theory", longman, Latest Edition.

ME 14.330 **Robotics** **Total Lecture 40**
Credit 3-1-0-4

Prerequisite(s) EC 14.101

Objective(s)

- *To provide fundamental knowledge of the various sub-disciplines such as kinematics, dynamics, controls, sensors, actuators, etc.*
- *To provide adequate background in both analysis and design of robots.*
- *To provide basic understanding of application of robotics in various applications.*
- *To understand economics behind application of robotics*

1. **Introduction**: Classification of robots, basic robot components, manipulator end effectors, controller, power unit, sensing devices, specification of robot systems, accuracy precision and repeatability. **[5]**
2. **Robot Motion Analysis**: Manipulator Kinematics, Inverse Manipulator Kinematics, Manipulator Dynamics-Newton-Euler and Lagrange formulation, Trajectory generation. **[5]**
3. **Robotic sensing devices**: Position, velocity and acceleration sensors, proximity and range sensors, touch and slip sensors, tactile sensors, force and torque sensors. **[8]**
4. **Robotic vision system**: Imaging components, picture coding, object recognition, training and vision systems, review of existing vision systems. **[8]**
5. **Robotics programming:** Methods of robot programming, types of programming, robotics programming languages, artificial intelligence. **[6]**
6. **Robot applications**: Material transfer and machine loading /unloading, processing applications, welding and painting assembly and inspection, future robotic applications and related technologies developments. **[5]**
7. **Economics analysis of robotics:** Robotics project analysis, life cycle costs, data required for economic analysis, methods of economic analysis. **[3]**

Outcome(s)

- *Be able analyze and design robot for automation purpose.*
- *Be able to understand concept of sensors and actuators. Identify sensors and actuators required for specific applications.*
- *Understand programming principles for robot control.*
- *Implement hardware and software to build a robot that can perform a task.*

TEXT BOOKS:

1. M.P. Groover, M.Weiss, P.N.Nagal, and N.G Odrey, Industrial Robotics, McGraw Hill.
2. K.S. Fu, R.S. Gonzalez, C.S.G. Lee, Robotics Control, Sensing Vision and Intelligence, TMH, Latest edition.

REFERENCE BOOKS:

1. Y.N. Shimon (Editor), hand book of industrial robotics Jhon Wiley and sons.
2. C. Anthony, Mc Donald, Robot Technology, theory, design and applications, Prentice Hall.
3. J. S. Robert, Fundamentals of Robotics Analysis and Control, Prentice Hall, Latest Edition

ME14.310 **Computational Methods Laboratory** **0-0-2-1**

List of Experiments

1. Solving algebraic and transcendental equations using computer programs. [6]
2. Solving a system of linear algebraic equations using direct methods and iterative methods in a computer. [6]
3. Making computer programs on numerical integration and differentiation and some given problems in computer. [4]
4. Developing computer programs for various types of curve fittings and solving a given problem in computer. [4]
5. Developing computer programs for solution of ODE and PDE and solving the same in computer. [4]

ME 14.312 **I.C. Engines Laboratory** **0-0-2-1**

List of Experiments

1. To Study the performance characteristics of single cylinder four stroke petrol engine. [6]

    a. To investigate torque speed and power relationship
    b. To study mean effective pressure
    c. To plot different engine performance curve
    d. To determine volumetric and thermal efficiency

2. To Study the performance characteristics of single cylinder four stroke diesel engine. [6]

    a. To investigate torque speed and power relationship
    b. To study mean effective pressure
    c. To plot different engine performance curve
    d. To determine volumetric and thermal efficiency
    e. To plot a Willans line

3. To Study the performance characteristics of Reciprocating Compressor [6]

    a. To investigate compressor performance with variation in pressure and speed
    b. To determine mechanical, volumetric and isothermal efficiency of compressor
    c. To investigate energy balance and thermodynamics of compressor

4. To Study the performance characteristics of Centrifugal Compressor [6]

    a. To investigate compressor performance with variation in speed.
    b. To investigate non dimensional characteristics.
    c. To compare the performance of centrifugal compressor with ideal system.

ME 14.314 **Production Technology Practice- II** **0-0-2-1**

List of Experiments

1. Study of capstan and turret lathe. [2]
2. Job – I: One component on capstan lathe consisting of various operations. [2]
3. Job – II: One component on turret lathe consisting of various operations [2]
4. Study of surface grinder and centre less grinding machine. [2]
5. Job – III: Surface Grinding. [2]
6. Job – IV: Centre less grinding. [2]
7. Study of Radial Drilling Machine. [2]
8. Job V: To perform different drilling, reaming and boring operations on Radial Drilling Machine. [2]
9. By using lathe tool dynamometer measure the cutting forces in all directions and calculate the following: a) Shear plane angle b) Coefficient of friction c) Power consumption. [4]
10. By using the drill dynamometer, measure the torque and thrust in Drilling operation. [2]
11. Cutting forces measurement during milling using milling dynamometer. [2]

ME 14.316 **Metrology & Quality Control Laboratory** **0-0-2-1**

List of Experiments

1	To measure gaps with help of slip gauges.	**[2]**
2	Measurement of angle/taper using a sine bar.	**[2]**
3	Measurement of chordal thickness of Gear tooth by Gear tooth vernier calliper.	**[2]**
4	Use of three-wire method to determine the effective diameter of external threads.	**[2]**
5	Measurement of flatness and roundness of a given machine/ground/lapped flat and round surface respectively using dial gauge.	**[2]**
6	Measurement of screw thread elements by tool Makers microscope and Inspection of various elements of screw thread by optical projector.	**[4]**
7	To measure surface roughness of a given test piece with the help of surface profilometer or surface roughness tester.	**[2]**
8	Study & Use of Control charts	**[4]**
9	Study of sampling plans.	**[4]**

ME 14.401 **Thermal Engineering System** **Total Lectures: 40**
Credit 3-1-0-4

Prerequisite(s): Engineering Thermodynamics

Objective(s):

Thermodynamics is an essential part of engineering curricula, and has a broad application area such as transportation vehicles, power generation and cooling systems. The course will cover the basic principles of thermodynamics and will give students knowledge about how thermodynamics is applied in engineering practice.

1. **Steam Generator and Draft:** Introduction; classification of boilers; comparison of fire tube and water tube boiler; their advantages; description of boiler; Lancashire; locomotive; Babcock; Wilcox etc, boiler mountings and accessories; natural draught chimney design; artificial draught; stream jet draught; mechanical draught; calculation of boiler efficiency and equivalent evaporation. Introduction to high pressure boiler [8]
2. **Steam & Gas Nozzles:** Flow through nozzle, Variation of velocity, Area and specific volume, Choked flow, Throat area, Nozzle efficiency, Off design operation of nozzle, Effect of friction on nozzle, critical pressure ratio for maximum discharge; physical explanation of critical pressure; super saturated flow of steam; design of steam nozzle. [8]
3. **Steam Turbines:** Introduction; classification of steam turbine; impulse turbine; working principal; compounding of impulse turbine; velocity diagram; calculation of power output and efficiency; maximum efficiency of a single stage impulse turbine; design of impulse turbine blade section; impulse reaction turbine; working principle; degree of reaction; parsons turbine; velocity diagram; calculation of power output; efficiency of blade height; condition of maximum efficiency; internal losses in steam turbine; governing of steam turbine. [10]
4. **Compressors:** [6]
   Classification, single and multistage reciprocating compressors, isothermal and volumetric efficiencies, centrifugal and axial flow compressors, surging, choking and stalling.
5. **Steam Condensers:** Component of steam condensing plant; types of condensers; air leakage in condensers; Dalton's law of partial pressure; Condenser vacuum, sources of air leakage & its disadvantages, vacuum efficiency; calculation of cooling water requirement; air expansion pump. [8]

Outcome(s):

Apply basic fluid mechanic, thermodynamic, and heat transfer principles and techniques, including the use of empirical data and property tables, to the analysis of representative fluid and thermal energy components and systems.

Apply basic fluid mechanic, thermodynamic, and heat transfer principles and techniques, including the use of empirical data and property tables, to the design analysis of auxiliary fluid and thermal energy components and systems representative of the systems encountered in the practice of electrical, industrial, and related disciplines of engineering.

Text Books:

1. P.K. Nag , “Basic and Applied Thermodynamics”, Tata Mc Graw Hill Pub
2. Kearton W. J, “Steam Turbine Theory and Practice”, CBS Publisher & Distribution Pvt Ltd, Latest Edition
3. R.K. Rajput, “Thermal Engg.”, Laxmi Publication

Reference Books:

1. Ballaney P. L, “Thermal Engineering”, Khanna Publishers, Latest Edition.
2. Yadav R, “Thermodynamics and Heat Engines”, Central Publishing House, Latest Edition
3. Chattopadhyay P, “ Boiler Operation Engineering”, TMH, 11th Edition, 2008.

ME 14.403 **Refrigeration and Air Conditioning** **Total Lectures: 40**

Credit-3-1-0-4

Prerequisite(s): Engineering Thermodynamics
Heat Transfer

Objective(s): *This course deals with the heating and cooling effects produced in domestic and industrial applications. The objectives of the course is to enable the student;*

- *To understand the principles of refrigeration and air conditioning.*
- *To calculate the cooling load for human comfort & different applications.*
- *To select the right equipment for a particular application.*
- *To understand the effect of temperature and pressure on moist air.*

6. **Introduction:** Definition of refrigeration & air conditioning; Necessity; Methods of refrigeration; Unit of refrigeration; Coefficient of performance (COP), Fundamentals of air-conditioning system. [2]
7. **Air Refrigeration System:** Carnot refrigeration cycle; Temperature Limitations; Brayton refrigeration or the Bell Coleman air refrigeration cycle; Necessity of cooling the aero plane; Air craft refrigeration systems, Simple cooling and Simple evaporative types, Boot strap and Boot strap evaporative types, Regenerative type and Reduced Ambient type system, Comparison of different systems. [4]
8. **Vapor Compression Refrigeration Systems:** Simple Vapour Compression Refrigeration systems-Limitations of Reversed Carnot cycle with vapour as the refrigerant; Analysis of VC cycle considering degrees of sub cooling and superheating; VC cycle on p-v, t-s and p-h diagrams; Effects of operating conditions on COP. [5]
9. **Multistage Vapor Compression Refrigeration Systems:** Necessity of multistage compression, Compound VC cycle, Inter cooling with liquid sub –cooling and / or water inter cooler: Multistage compression with flash inter cooling and / or water inter-cooling; systems with individual or multiple expansion valves; Individual compression system with individual or multiple expansion valves; Individual compression systems with individual or multiple expansion valves but with and without intercoolers. [7]
10. **Vapor Absorption Refrigeration Systems:** Basic Systems, Actual COP of the System, Performance, Relative merits and demerits; Properties of aqua ammonia; Electrolux Refrigeration; Steam Jet Refrigerating System. [3]
11. **Refrigerants:** Definition, Classification, Nomenclature, Desirable properties, Comparative study, secondary refrigerants, Introduction to eco-friendly Refrigerants; Introduction to Cryogenics. [3]
12. **Psychrometry:** Properties of moist Air-Gibbs Dalton law, Specific humidity, Dew point temperature, Degree of saturation, Relative humidity, Enthalpy, Humid specific heat, Wet bulb temp., Thermodynamics wet bulb temp., Psychrometric chart; Psychrometry of air-conditioning processes, Mixing Process, Basic processes in conditioning of air; Psychrometric processes in air washer. [7]

13. **Air Conditioning:** Classification; factors affecting air conditioning systems; comfort air-conditioning system; winter air conditioning system; summer air-conditioning system; year round air conditioning; unitary air-conditioning system; central air conditioning system; room sensible heat factor; Grand sensible heat factor; effective room sensible heat factor; Inside design conditions; comfort conditions; components of cooling loads; internal heat gains; system heat gain: external heat gain; Transport air conditioning. [9]

Outcome(s):

Able to understand basic principles of refrigeration.
Able to understand simple and multiple vapour-compression cycle, gas refrigeration cycles and absorption cycles.
Ability to understand the principles of thermal comfort & ventilation
An ability to use refrigerant property tables and psychrometric chart.

Text Books:

1. Stocker W. F. and Jones J.W., "Refrigeration & Air conditioning", TMH, New Delhi, Latest Edition.
2. Arora C. P., "Refrigeration & Air conditioning", TMH, New Delhi, Latest Edition.

Reference Books:

1. Prasad M, "Refrigeration & Air conditioning", Wiley Eastern limited, New Delhi, Latest Edition.

ME 14.405 **Total Lectures: 40**

Production Technology III

Pre – requisites: Material Science, Production Technology I **Credit-3-0-0-3**

Objective: *The course should enable the students :*

1. To exposed to fundamental concept of machining processes like grinding, super-finishing, thread and gear manufacturing.
2. To familiar with rapid prototyping.
3. To understand various non conventional manufacturing processes.

1 **Abrasive Machining:** Grinding machines, various grinding operations; Grinding wheels, preparation for wheel operation. Lapping, honing, super finishing. **[7]**

2 **Threads and Gear manufacturing:** Introduction, thread making, thread grinding, thread rolling, Gears types and gear making, machining of gears, gear finishing. **[6]**

3 **Powder Metallurgy:** Introduction, basic process, powder manufacturing, powder mixing and blending, composting, sintering. **[5]**

4 **Rapid prototyping and Micro Manufacturing:** Introduction, role of rapid prototyping & rapid tooling, features and classifications. Micro & Nano manufacturing processes, fabrication of electronics products and IC. **[6]**

5 **Jigs & Fixtures:** introduction, necessity for jigs & fixtures, elements of fixtures, locators, types of locators, clamping, locating principles. **[4]**

6 **Non Traditional Machining:** AJM, WJM, EDM, ECM, USM: working principle, components of set up, field of application, Parameters affecting machining characteristics, Material removal mechanism. **[12]**

Outcome *The students should be able to:*

1. Apply the knowledge of various advance manufacturing processes.
2. Identify various process parameters and their effect on processes.
3. Figure out application of modernization in machining.
4. Get the knowledge of Jigs and Fixtures so as to utilize machine capability for variety of operations

Text Book

1. Lindberg, "Processes and Materials of Manufacture", Prentice hall India (P) Ltd, Latest Edition.
2. Rao P. N, "Manufacturing Technology", TMH, Latest Edition.
3. Mikell. P. Grover, Fundamentals of Modern Manufacturing, Pearson Publications.

Reference Book

1. Degarmo, Black and Kosher, "Material and Processes in Manufacturing", Latest Edition.
2. Kempster M. H. A, "Introduction to Jigs and Fixtures Design", Latest Edition.
3. Ghosh A, "Rapid Prototyping", EWP, Latest Edition.

ME 14.407 **Industrial Engineering & Operation Research** **Total Lectures: 40**

Pre – requisites: Knowledge of linear algebra and basic mathematical concepts **Credit-3-0-0-3**

Objective: *The course should enable the students :*

1. To understand Concept of Industrial Engineering
2. To learn various Industrial Engineering techniques
3. To understand and apply operations research techniques to industrial applications
4. To understand Linear Programming concepts
5. To understand sequencing game theory

1 **Introduction to Industrial Engineering:** Relevance & importance of industrial engineering in industry. Productivity Management*:* Productivity measurement and improvement. [3]

2 **Plant Layout & Material Handling***:* Factors affecting plant location, Selection of plant site, Quantitative techniques of plant location decision, Plant layout, Types of layout Principles of layout design, Methods for evaluation of a layout, Quantitative techniques of developing layouts, Manual assembly lines, line balancing problems way to improve line balancing. Group Technology, parts family, parts classification and coding, production flow analysis. Introduction to material handling. [12]

3 **Work study & Ergonomics:** Method study, micro - motion study and principles of motion economy. Work measurement: time study, work sampling, standard data, PMTS. Introduction to ergonomics and its scope in relation to work. [7]

4 **Linear Programming**: Introduction to Operation Research, Problem formulation, Simplex methods, primal & dual problem, dual Simplex, sensitivity analysis. Transportation, & Assignment problems, Dynamic Programming. [12]

5 **Decision & Queuing Theory:** Decision under various conditions. Game Theory, Minimax & Maximin strategies. Introduction to Queuing Models. [6]

Outcome: *The students should be able to:*

1. Understand Concept of Industrial engineering and its role in industry.
2. Be good team member and project leaders to carry out projects in companies.
3. Build and solve Linear programming, Transportation models and assignment models.
4. Develop critical thinking and objective analysis decision making.

Text Books:

1. Khanna O P, "Industrial Engineering and Management", Dhanpat Rai Publications, Latest Edition.
2. Monks J. G, "Production/Operations Management", McGraw Hill, Latest Edition.

3. Taha H. A, "Operations Research – An Introduction", Prentice Hall India, Latest Edition

2. Sanders M. and Mc Cormic, E., "Human Factors in Engineering", McGraw Hill, Latest Edition.
3. Work Study, ILO, Geneva, Latest Edition.
4. Curie R, "Introduction to Work Study", McGraw Hill, Latest Edition.
5. Philips R & Solberg, "Operations Research", John Wiley, Latest Edition.
6. J K Sharma, Operations Research, Macmillan, 1997

ME 14.415 Mechatronics Total Lecture 40

Credit 3-1-0-4

Prerequisite(s) EC 14.101

Objective(s)

- *To study the definition and elements of mechatronics system.*
- *To learn how to apply the principles of mechatronics for the development of productive and efficient manufacturing systems.*
- *To study the hydraulic and pneumatic systems employed in manufacturing industry.*

1. **Introduction**: Definition of Mechatronics, Mechatronics in manufacturing, Products, and design. Comparison between Traditional and Mechatronics approach. **[5]**

2. Review of fundamentals of electronics. Data conversion devices, sensors, micro sensors, transducers, signal processing devices, relays, contactors and timers. Microprocessors controllers and PLCs. **[9]**

3. **Drives:** stepper motors, servo drives. Ball screws, linear motion bearings, cams, systems controlled by camshafts, electronic cams, indexing mechanisms, tool magazines, transfer **[6]**

4. **Hydraulic systems**: flow, pressure and direction control valves, actuators, and supporting elements, hydraulic power packs, pumps. Design of hydraulic circuits. **[8]**

5. **Pneumatics:** production, distribution and conditioning of compressed air, system components and graphic representations, design of systems. Description **[6]**

6. Description of PID controllers. CNC machines and part programming. Industrial Robotics. **[6]**

Outcome(s)

- *Be able to analyze and design mechatronics system used for automstion.*
- *Demonstrate knowledge on basic electronics used in manufacturing systems.*
- *Be able to design hydraulic systems for automating manufacturing systems.*
- *Be able to design pneumatic systems for automating manufacturing systems.*

Text Books:

1. HMT ltd. Mechatronics, Tata Mcgraw-Hill, New Delhi, 1988.
2. J. Musa, Fundamentals of Mechatronics, 1st Edition, Cengage Learning, 2012.

Reference Books:

1. G.W. Kurtz, J.K. Schueller, P.W. Claar . II, Machine design for mobile and industrial applications, SAE, 1994.
2. T.O. Boucher, Computer automation in manufacturing - an Introduction, Chappman and Hall, 1996.
3. R. Iserman, Mechatronic Systems: Fundamentals, Springer, 1st Edition, 2005

ME 14.417 **COMPOSITE MATERIALS** **Total Lectures: 40**

Credit 3-1-0-4

Prerequisite Material Science and Metallurgy

Objectives: *To provide a basic understanding of the mechanical and physical properties of polymeric, metallic, and ceramic composites.*
To understand the fundamentals of composite material strength and its mechanical behaviour.
Understanding the analysis of fiber reinforced Laminate design for different combinations of plies with different orientations of the fiber.
To obtain knowledge and skills needed for the optimum design and manufacture of advanced composite components.

1 **Introduction to Composite Materials:** Introduction, Definition of composite material, Classification based on matrix and topology, Constituents of composites, Interfaces and Interphases, Distribution of constituents, Nano-composites. **[8]**
Reinforcements: Fibres-Glass, Silica, Kevlar, carbon, boron, silicon carbide and boron carbide. Fibres, Particulate composites, Polymer composites, Thermoplastics,
Thermosets, Metal-matrix and ceramic composites

2. **Fabrication of Composites :** Fabrication of Metal Matrix Composites: Commonly used matrices, Basic Requirements in Selection of constituents, solidification processing of composites - XD process, Spray processes - Osprey Process, Rapid solidification processing, Dispersion Processes - Stir-casting & Compocasting, Screw extrusion, Liquid-metal impregnation technique – Squeeze casting, Pressure infiltration, Lanxide process), Synthesis of In situ Composites; Fabrication of Polymer Matrix Composites - Commonly used Matrices Basic Requirements in selection of Constituents, Moulding method, Low pressure closed moulding, pultrusion, Filament winding, Fabrication of ceramic matrix composites - Various techniques of vapour deposition, Liquid phase method and Hot pressing **[8]**

3. **Secondary Processing and Joining of Composite :** Forging and extrusion of composites – critical issues, dynamic recovery and dynamic recrystallization, mechanical properties; Induction Heating, Fusion Bonding, Ultrasonic welding, Gas tungsten arc welding, Gas metal arc welding, Resistance spot & seam welding, Resistance brazing, Resistance spot joining, Resistant spot brazing, Resistance welding of thermoplastic-graphite composite, Weld bonding, Brazing of MMC **[8]**

4. **Performance of Structural Composites:** Prediction of composite properties, tensile strength of fibre reinforced composites, modulus of elasticity, poission's ratio, density, tribological and thermal properties. Influence of environmental effects such as elevated temperature, moisture etc. on composite properties Laminated plate model, Eshelby's models and Other models. **[8]**
Performance of Composite in Non-structural Applications: Composites in

Electrical, Superconducting and Magnetic Applications, Nano-composite devices.

5. **Characterisation of Composites:** Control of particle/fibre and porosity content, particle/fibre distribution, Interfacial Reaction of matrix-reinforcing component, Coating of reinforcing component, Strength analysis. **[8]**
Industrial Application of Composite Materials : Civil constructions of structures/panels, Aerospace industries, Automobile and other surface transport industries, Packaging industries, House hold and sports components etc.

Course outcome:

- *Discuss the benefits and disadvantages of using composites in various structures.*
- *Select the most appropriate manufacturing process for fabricating composite components*
- *Demonstrate understanding of the different materials (fibres, resins, cores) used in composites*
- *Calculate the elastic and strength properties of unidirectional laminates using micromechanics theory*
- *Describe the fracture, fatigue and impact performance of composites*

TEXT BOOKS:

ME 14.419 **Non Convectional Energy Resources** **Total Lectures: 40**

Credit: 3-1-0

Prerequisite(s): Nil

Objective(s):

- *To familiarize students with the various renewable energy sources.*
- *Awareness of the potential of renewable energy technologies, for sustainability in particular.*
- *Suitable applications of solar, wind, biomass, hydro, geothermal and ocean energy.*
- *Awareness and development of suitable social and economic models with implications.*

1. **Energy Scenario**
   Energy resources in India and worldwide, energy needs and consumption patterns, social and economic implications, global environmental impact, Kyoto protocol, salient features of renewable energy technologies, pollution control and sustainability, Indian govt. policies and Supreme Court directive on renewable energy, subsidies, incentives and other financial implications, ROI., energy audit, energy optimization, green buildings. **10**

2. **Solar Energy Applications**
   Solar thermal systems: Domestic and industrial water heating, green houses, concentrated solar power (CSP), solar refrigeration and air conditioning, solar appliances- cookers, dryers, desalination of water, turbines.
   Solar photovoltaic systems (PV): Solar cell fundamentals, classification, comparison of silicon, thin film, Building Integrated photovoltaic (BIPV) panel technologies, stand alone and grid – integrated systems including storage and other components, economics. **10**

3. **Wind Energy**
   Fundamentals of wind energy, wind power systems- turbines, site selection and economics. grid connected operation, comparison with other renewable systems. **10**

4. **Other Energy Sources**
   Biomass-Conversions and energy content, mini hydro power plant, advantages and economics, geothermal, ocean tidal, wave and thermal energy, fuel cells, hybrid Systems, energy storage, emerging technologies. **10**

Outcome(s):

- *Identify appropriate renewable technology for application.*
- *Assess the economics and ROI.*
- *Implement concepts of clean development mechanism (CDM) and carbon credits.*
- *Utilize energy management and renewable energy systems in everyday life.*
- *Select ecofriendly, cost effective, energy efficient alternatives to unsustainable practices.*

1. M. M. El-Wakil, "Power Plant Technology", McGraw-Hill, Latest Edition.

ME 14.421 **Product Design and Development** **Total Lecture 40**
Credit 3-1-0-4

Prerequisite(s)

Objective(s) *This course aims at introducing the students to the basic concepts of engineering design and product development with focus on the front end processes.*

1. **Introduction:** Concept of Product, definition and scope, Introduction to product development, Product design and development process, Challenges of product development, Need based developments; Technology based developments, Physical reliability & economic feasibility of design concepts. **[8]**

2. **Needs Identification & Conceptual Design**: Interpret raw data in terms of customers need, organize needs in hierarchy and establish the relative importance of needs, Generation, selection & embodiment of concept, Product architecture. Industrial design: process, need. Robust Design: Taguchi Designs & DOE. Design Optimization **[8]**

3. **Design for Mfg & Assembly:** Methods of designing for Mfg & Assembly. Designs for Maintainability. Designs for Environment. Product costing. Legal factors and social issues. Engineering ethics and issues of society related to design of products **[8]**

4. **Value Engineering/Value Analysis:** Definition. , importance of value, value analysis job plan, creativity,. Case studies. Economic analysis: Qualitative & Quantitative. Material and process selection in value engineering. Concept of Product Life Cycle Management **[8]**

5. **Concurrent Engineering:** Rapid prototyping, Tools for product design–Drafting / Modeling software. CAM Interface. Patents & IP Acts. Overview, Disclosure preparation. **[8]**

Outcome(s) *The student is expected to demonstrate an understanding of the overview of all the product development processes and knowledge of concept generation and selection tools.*

ME 14.402 Professional Values and Ethics in Engineering Total Lectures 40 3-0-0-3

1. **Introduction:** Definition, objectives and issues in values and ethics, Senses of Engineering Ethics, Moral Autonomy- Koblberg's theory- Gilligan's theory, Professions and Professionalism. [8]

2. **Engineering being Social Experimentation:** Concept of relative values- social, professional and ethical, Codes of Ethics, Industrial standards, A balanced outlook on low, Importance of values and ethics in corporate world. [8]

3. **Strategies and their Formulation:** Importance of value and ethics in conception and formulation of strategy in engineering industries, democratic values, issues in governance and responsibility, safety and risk, risk benefit analysis- some case studies. [8]

4. **Rights and Responsibilities:** An overview of the Indian value system and its application in corporate life partaing to engineering industries. Collegiality and Loyalty, respect for Authority, collective bargaining, Professional rights, Employee rights, Intellectual property rights. [8]

5. **National and International Issues:** Multinational Corporations and business ethics, various care studies pertaining to environment, computer world, social engineering, weapon development, Role of engineering as a managers, consultant, expert witness and moral leader, code of conduct for engineers. [8]

ME 14.404 **CAD/CAM** **Total Lecture 40**
3-0-0

Prerequisite(s) **Mathematics (Matrix), Machine Design, C programming, Machine tool and Machining**

Objective(s)

- Understand the applications and benefits of CAD
- Understand geometric transformation.
- Understand various representations of curves and surfaces.
- Understand the various concepts and characteristics in geometric modeling.
- Understand the basic concepts of CAM. Analyze the components and systems of NC and CNC machine tools. Understand and apply various programming methods for specific jobs.
- Classify various CAPP systems.
- Understand FMS and CIMS with reference to components, advantages and applications.

1. **Fundamentals of CAD**: Introduction: Design Process: Application of computers in design: Creating manufacturing database: benefits of CAD. Computer Hardware; Graphic input devices; display devices; Graphics output devices; Central processing unit (CPU). CAD software and Database: Software configuration of a graphics system: functions of a graphics package: geometric modeling: Database structure and control; Graphics standard: GKS and IGES. **[4]**

2. **Geometric Transformations**: Mathematics preliminaries, matrix representation of 2 and 3 dimensional transformation: Concatenation of transformation matrices. Application of geometric transformations. **[8]**

3. **Representation of curves and surfaces**: Polygon, meshed and ruled surfaces: Bezier curves; B-spline curves. **[6]**

4. **Geometric Modeling**: Wireframe model: solid modeling: representation, volumetric properties, surface modeling, concepts of hidden-line removal and shading: Kinematics analysis and simulation. Application of CAD techniques to finite Element Mesh Generation. Computer Aided Manufacturing (CAM) **[9]**

5. **Introduction of CAM**: Basic concepts of manufacturing system and CAD/CAM. NC/CMNC Machine Tools; NC machine tools- basic components, coordinate systems; features of NC machine tools. Computerized Numerical Control (CNC): Tooling for NC machines - tool presetting equipment, flexible tooling, tool length compensation, tool path graphics; NC motion control system; Manual part programming, fixed/floating zero. Block format and codes: Computer assisted part programming. DNC and Adaptive Control: Direct numerical control: Adaptive control in machining system; Combined DNC/CNC system. **[9]**

6. **Computer Aided Process Planning**: Introduction and benefits of CAPP. Types of CAPP systems, machinability data selection systems in CAPP. **[2]**

7. **FMS and CIMS**: Flexible Manufacturing System (FMS) and Computer integrated manufacturing system: FMS and its advantages, components of a FMS system. Introduction to CIMS. **[2]**

Outcome(s)

- Understand the capabilities of general Computer Aided Designing Systems and CAD Systems for designing mechanical parts and elements in 2D and 3D dimensions.
- Use effectively CAD / CAM systems in order to produce the final NC code for the manufacturing of various mechanical parts and carry out exchange of data between CAD and CAM systems.
- Describe the principles of various manufacturing processes, manufacturing technology.

TEXT BOOKS:

1. Groover M.P., "Automation, Production Systems and Computer-Integrated Manufacturing", PHI, Latest Edition.
2. Zeid Ibrahim, "CAD/CAM : Theory & Practice", Tata Mc Graw Hill Publication, Latest Edition.

REFERENCE BOOKS:

ME 14.406 Operations Management

Total Lectures: 40

Pre – requisites: Elementary knowledge of calculus

Credit 3-1-0-4

Objective: *The course should enable the students :*

1. To understand the strategic significance of Operation management

2. To impart knowledge on Forecasting, Project management, Inventory, Scheduling & capacity planning with appropriate tools and techniques needed for understanding the operational situation.

1 **Manufacturing System:** Introduction to operation management, Types and characteristics of manufacturing systems. [3]

2 **Forecasting Technique:** Use and types of forecasting, Methods of forecasting. Regression analysis [6]

3 **Project Management:** Project management techniques; Introduction to CPM and PERT techniques, network analysis, activities and events, conventions adopted in drawing networks, graphical representation of events and activities. [5]

4 **Materials Planning and Control:** Field and scope, materials planning; Inventories-types and classification; ABC analysis, economic lot size, EOQ model, leads time and reorder point, inventory control systems.
Aggregate planning: definition, aggregate planning methods, Introduction to MRP and MRP-II, Master Production Schedule, Bill of materials. [12]

5 **Operations Scheduling:** Concepts, loading, scheduling and sequencing, single processor scheduling, flow shop scheduling, job shop scheduling, scheduling criteria; Gantt chart. [6]

6 **Capacity Planning:** Definition of capacity, capacity planning, capacity requirement planning, Capacity available and required. [4]

7 **JIT & ERP:** Introduction to the new manufacturing concepts; JIT, lean manufacturing, pull and push systems of production; Kanban system. Introduction to ERP. [4]

Outcome *The students should be able to:*

1. Understand and recognize key issues and problems in Operations Management.

2. Develop an understanding of how Operations Management functions relate to overall organization strategy, effectiveness and performance.

Text Book

1. Monks, J. G, "Operations Management", TMH, Latest Edition.
2. Russel Taylor, "Operations Management"**,** Wiley India.
3. Adam & Ebert, "Productions & Operations Management", PHI, Latest Edition.

Reference Book

1. Buffa W, "Modern Production/Operations Management", Eastern Ltd, Latest Edition.
2. Chary S.N, "Production and Operations Management", TMH, Latest Edition.

ME 14.408 CAD/CAM Laboratory 0-0-2-1

List of Experiments

1. Implement simple programmes for the graphics representation of Transformation and projections. [3]
2. Implement simple programmes for the graphics representation of Conic Sections, cubic splines, and B-splines. [3]
3. Implement simple programmes for the graphics representation of Surfaces- Bilinear, Bicubic surface patch and Bezier surface. [3]
4. Understanding of various CAD commands and creating simple objects. [3]
5. Understanding of holes, cuts and model tree relations. [3]
6. Creation of shafts, rounds, chamfers and slots. [3]
7. Sketch Tools & Datum planes. [3]
8. Creation of objects by revolved features and sweeps. [3]
9. Creation of objects by patterns and copies and blends. [3]
10. Creation of engineering objects in detail using loft feature. [3]
11. Creation of engineering drawing details such as dimensioning, sectional views, adding aesthetics. [3]
12. Assembling of part models using constraints. [3]
13. Assembly operations - part modifications, adding another assembly features display. [3]
14. Generation of GM codes for the given machine part for making the part using CAD software. [3]

Mody University of Science & Technology

	Total Credits	**26**

Detailed course syllabus for First Semester- M. Tech (NST)

MA 521 Engineering Mathematics and Numerical Analysis 3-1-0-4

1. Ordinary Differential Equations: Ordinary differential Equations of first order and first Degree (Equations in which variables are separable, homogeneous, linear, exact), linear differential equations with constant coefficients and variable coefficient . **[10]**

2. Partial Differential Equations: First order partial differential equations with constant coefficients (variables separation method), one dimensional heat and wave equation, Laplace equation in two dimension, power series solution of differential equation (Frobenius method). **[08]**

3. Special Functions: Bessel's function and equation, Legendre function, Green function **[06]**

4. Numerical Methods: Use of interpolation formula (equal and unequal intervals), numerical integration (Trapezoidal and Simpson's rules), numerical differentiation, solution of linear system of equation (Gauss elimination and Gauss Seidel method), solution of nonlinear equation (Bisection method, Regula Falsi and Newton's Raphson method),numerical solution of ordinary differential equation (Predictor - Corrector methods, Runga-Kutta method). **[16]**

Text Books:

1. E. Kreyzig , Advanced Engineering Mathematics" 2nd edition, John Wiley & Sons, 2004
2. B. V. Ramana, Higher Engineering Mathematics, McGraw-Hill, New Delhi
3. S.S. Sastry, Introductory Methods of Numerical Analysis, PHI, 5th edition,2012

Reference Books:

1 S.C. Chapara and, R. P. Canale, Numerical methods for Engineers", 2nd Edition, Tata McGraw-Hill, New Delhi, 2002
2. Ram Babu, Engineering Mathematics, Pearson Publication, New Delhi, 2010
3. Ram Babu, Numerical Methods, Pearson Publication, New Delhi, 2010

NU 501 Quantum Mechanics and Electrodynamics 3-1-0-4

Quantum Mechanics

1. Origin of quantum theory and related experiments, wave-particle duality, wave function and its Born interpretation, uncertainty principle, Schrodinger equation, wave functions, wave packets, probability amplitudes, solutions to Schrodinger equation in one dimensions; Barrier penetration, Potential wells, Simple harmonic oscillator, Schrodinger equation in three dimensions. [**7**]
2. Formalism of quantum mechanics; Liner vector space, Function spaces, Hilbert space formalism, inner product and probability, completeness of Eigen functions, delta functions, Bra & Ket notation, matrix representation of an operator, change of basis, unitary transformations. [**6**]
3. General treatment of angular momentum, spin, identical particles; SHM problem by operator method; Pauli exclusion principle; Scattering theory; some calculations, Perturbation theory, WKB approximation. [**7**]

Electrodynamics

4. Coulomb law and electrostatics, Laplace and Poisson equations, Maxwell's equations, partial polarization, Lorentz force, Poynting theorem. Scalar and vector potentials, Gauge transformations and gauge invariance. [**5**]
5. Special theory of relativity, four vectors, Field tensor, Relativistic formulation of electrodynamics, Maxwell equations in covariant form [**4**]
6. Relativistic charged particle in an electromagnetic field, Motion in uniform electric and magnetic fields and combinations of E and B fields, Non uniform static magnetic field [**4**]
7. Green's function for wave equation (relativistic), Radiation from localized moving charges, Multi pole expansion, dipole and quadrupole radiation, Radiation from accelerated charge [**4**]
8. Power radiated by point charge, Larmor's formula, Angular distribution of power, Bremsstrahlung and synchrotron radiation, Dispersion theory, Radiative reaction, Radiative damping [**5**]

Text Books:

1. Griffiths D. J., Introduction to Quantum Mechanics, 2nd edition, Pearson, 2009.
2. Griffiths D. J., Introduction to Electrodynamics, 3rd edition, Prentice Hall India, 1999.

2. Zettili N., Quantum Mechanics: Concepts & Applications, 2nd edition, Wiley, 2009.
3. Jackson J. D. Classical Electrodynamics, 3rd edition, Wiley, 1998.
4. Lifshitz E. M. & Landau L. D., Quantum Electrodynamics (Course of Theoretical Physics), 2nd edition, Pergamon Press, 1981.

NU 503 **Nuclear Physics** **3-1-0-4**

1. **Introduction:** Basic properties of the nucleus and nuclear radiations **[4]**

2. **Two Nucleon Problem:** The Two Nucleon Problem, Quadrupole & Magnetic moments of Deuteron, S_{12} operator, Existence of non-central forces. Deuteron bound state wave function & energy **[7]**

3. **Nuclear Forces:** np scattering cross-section, ortho & para hydrogen states, Nuclear forces, spin dependence, pp scattering, Existence of repulsive core inside a nucleon**. [7]**

4. **Nuclear Stability:** Binding energy and nuclear stability. **[4]**

5. **Nuclear Reactions:** Kinematics, Direct and Compound Nucleus Reactions, Energetic and general cross section behavior in nuclear reactions**.** **[6]**

6. **Radioactive Decays:** Alpha decay, Beta decay, Fermi's theory of beta decay, determination of mass of neutrino and Gamma decay **[6]**

7. **Nuclear Models:** Liquid drop Model, Nuclear Fission, Shell Model, Spin-Orbit interaction. Application of Shell Model **[6]**

Text Book:

1. Kenneth S. Krane, *Introductory Nuclear Physics*. Hoboken: John Wiley & Sons, Inc., 1987
2. Walter E. Meyerhof, *Elements of Nuclear Physics*. New York: McGraw-Hill, 1967.
3. R.R. Roy & B.P. Nigam, Nuclear Physics: Theory and experiments, 1st edition, New Age nternational, 1967.

Reference Book:

1. Bernard L. Cohen, *Concepts of Nuclear Physics*. New York: McGraw-Hill, (1971)

NU 505 **Nuclear Reactor Theory** **3-1-0-4**

1. **Basics Neutron Physics Concepts:** Neutron and its properties, Neutron and its interaction with matter, Neutron sources, Neutron-nuclear interaction cross sections, Reaction rate density, macroscopic cross section and mean free path. Cross-sections of elements, compounds and mixtures **[7]**
2. **Nuclear Fission**: Fissile and fertile atoms, conversion of fertile into fissile atoms, Fission power, fission chain, control of fission chain, Core physics involving criticality with introduction of four factor formula, Effective multiplication factor, concept of criticality, sub criticality and super criticality, conversion/ breeding ratio, fuel burn-up, Energy release from fission, Neutron yield, Energy distribution among fission neutrons and fragments. **[7]**
3. **Slowing Down and Energy Dependence:** Mechanism of energy loss by scattering collisions, Neutron Slowing-down and Thermalization, Neutron lethargy and average logarithmic decrement, Moderating ratio **[5]**
4. **Neutron Transport equation and Neutron diffusion equation**: Dependence of neutron flux on space, energy, direction and time, Boltzmann equation, Neutron balance equation, Simplified diffusion equation through Fick's law, Diffusion equation in Multiplying and non-multiplying media , Neutron slowing down-moderators-Fermi age model, Slowing down length, Migration length, One group Diffusion equation for finite bare homogeneous reactor, Critical equation and Reactor Buckling, Critical size and Geometrical Buckling (Cube and Semi-Cubic shape, sphere, cylinder), Critical volume and critical mass calculations, Reference to multi group approach, Reflected reactors, reflector saving, flux flattening, Heterogeneous reactors **[16]**
5. **Reactor Kinetics:** Time dependent diffusion equation, Point kinetics, Prompt neutrons, Delayed neutron precursors, Reactor period, period versus reactivity, In hour formula, Short term & long term variation of reactivity, Fission Product Poisoning **[5]**

Text Books:

1. J. R. Lamarsh**,** *Introduction to Nuclear Reactor Theory*, Addison- Wesley Publishing Company ,1966
2. S. Glasstone & A. Sessonske, *Nuclear Reactor Engineering*, Vol. I and Vol. II CBS Publishers & Distributors, New Delhi,2009
3. S. Garg, F. Ahmed and L. S. Kothari, *Physics of Nuclear* Reactors, Tata McGraw Hill, New Delhi, 1986

Reference Book:

1. W. M. Stacey, Nuclear Reactor Physics (Second edition), Wiley- VCH verlag GmbH, 2007

NU 507 Radiation Physics & Instrumentation 3-1-0-4

1. **Radiation**: Ionizing and non ionizing radiation, Natural and artificial radiation, Exposure and dose, units, Absorbed dose, effective dose, radiation sources, synchrotron radiation sources, Biological effects of ionizing radiation, Radiation protection standards and their implementation **[6]**
2. **Interaction of radiation with matter**: Interaction of charged particles, gamma rays, and neutrons with matter, energy loss of heavy charged particles in matter, electronic stopping power (Bohr, and Bethe-Bloch formulae), energy loss of electrons and positrons, Bragg curve, energy straggling, Range and Range straggling, energy loss by Bremsstrahlung radiation, Cerenkov radiation, photoelectric absorption, Compton scattering, pair production, Attenuation, Neutron elastic scattering, inelastic scattering, radiative capture, (n, p), (n, 2n), (n, α), (n, fission) reactions **[8]**

3. **Radiation Detectors**: Gas-filled ionization detectors-Ionization chambers, proportional counters and GM counters, Pulse height spectra and energy resolution. Working of a p-n junction detector, partially and totally depleted detectors, surface barrier detectors, Lithium drifted Silicon detectors (Si(Li)), high-purity Germanium(HPGe) gamma detectors, typical gamma-ray spectrum with an HPGe detector, Scintillation mechanism in inorganic crystal scintillators and organic scintillators, Characteristics and operation of alkali halide scintillators with details of NaI(Tl),Photomultiplier tubes. Pulse height spectrum using a monoenergetic gamma ray source, TLD, Production and detection of neutrons-typical neutron sources, slow neutron detection, BF3 counter, boron-lined proportional counter, boron loaded scintillators, Lithium containing slow eutron detectors, He proportional counters, fission counters, time of flight techniques **[16]**
4. **Reactor Instrumentation**: General considerations – Reactor Nuclear Instrumentation systems– an overview – pressurized water nuclear instrumentation, boiling water reactor nuclear instrumentation, In core detectors, self powered neutron detectors, detectors based on beta decay, detectors based on secondary electrons from gamma decay **[5]**
5. **Shielding & protection against radiation exposure**: Radiation Shielding, Different Geometric configurations, Requirement for Shielding, Biological shielding, Thermal shielding, Shielding Materials for Different Types of Radiation, Criterion for Selecting Shielding Material, External radiation protection, Internal radiation protection **[5]**

Text Book:

1. S. N. Ahmed, *Physics & Engineering of Radiation detection*, Academic Press, 2007
2. Herman Cember, *Introduction to Health Physics*, 3rd edition, McGraw-Hill, 1996
3. G. F. Knoll, *Radiation Detection and Measurement*, 3rd Edition, John Wiley and Sons, 2000

Reference Books:

1. J. E. Martin, *Physics of Radiation protection: A hand book*, 2nd edition, Wiley-VCH, 2006
2. N. Tsoulfanidis, *Measurement and detection of Radiation*, 2nd edition, Taylor Francis, 1995

NU 509 Simulation Methods 2-0-0-2

1. **Finite Difference Method:** Forward difference, Back-ward difference, Central difference, Differential coefficients of various orders and their equivalent finite difference forms with associated errors. Classification of second order differential equations-elliptic, parabolic and hyperbolic equations, Case studies of the three different equations and converting equations in finite difference form, Dirichlet and Neumann boundary conditions and conversion of the boundary conditions to finite difference forms to solve the differential equations of various types **[8]**

2. **Finite Volume Method**: Introduction to finite volume method, Application of boundary conditions, Expression of heat conduction at specified boundary conditions, Applications of finite volume method **[4]**

3. **Finite Element Method**: Introduction, Steps of solution procedure in FEM, Formulation of finite element equations, Galerkin Method, Variational Formulation, Application of FEM to problems related to Nuclear Engineering **[4]**

4. **Monte Carlo Simulation Techniques:** Introduction - Monte Carlo Methods, Random number generation, Monte Carlo Techniques, Crude Monte Carlo, Acceptance – Rejection Monte Carlo, Stratified Sampling, Importance of Sampling, Program Implementation, Other Applications for Monte Carlo Techniques **[4]**

Text Books:

1. B. S. Grewal, Numerical Methods in Engineering and Science, Khanna Publishers, Delhi.
2. O.C. Zienkiewicz, R.L. Taylor, J.Z. Zhu, Finite Element Method: Its Basis and Fundamental, 6^{th} ed., Tata Mc Graw Hill, 2005
3. Malvin H. Kalos, Paula A. Whitlock, Monte Carlo Methods, 2nd edition, Wiley-vch verlag Gmbh, 2008.

2. R. Herblin, Finite volume for Complex Applications III, Kogan Page, 2002
3. D. C. Handscomb & M. H. John, Monte Carlo Methods, Methuen Young Books, 1964.

NU 511 Modeling & Simulation Lab 0-0-4-2

Programs will be implemented using MATLAB/ FORTRAN

1. Write a program to implement Simpson's $1/3^{rd}$ rule for integration.
2. Write a program to implement Gauss Elimination Method to solve a system of equation.
3. Write a program to solve 1-dimensional heat transfer problem using symmetric banded matrix.
4. Write a program to solve 1-dimensional heat flow equation using Gauss Elimination Method.
5. Write a program to solve 2-dimensional heat flow equation using Gauss Elimination Method.
6. Write a program to solve 3-dimensional heat flow equation using Gauss Elimination Method
7. Write a program to solve heat transfer problem using FEM
8. Write a program to do stress calculations using FEM
9. Write a program to do structural Analysis using FEM
10. Introduction to CANDU Simulator

Suggested Books:

1. O.C. Zienkiewicz, R. L. Taylor, J.Z. Zhu, Finite Element Method: Its Basis and Fundamental, 6^{th} ed., Tata Mc Graw Hill, 2005

2. Getting Started with MATLAB: A Quick Introduction for Scientists and Engineers by Rudra Pratap

NU 513 Integrated Engineering Lab 0-0-4-2

1. To measure temperature using different types of measurement devices.
   a) J and K type thermometer b) Bimetal and gas (vapour) pressure thermometer
   c) PT 100 platinum resistance thermometer (four wire); d) NTC thermistor

2. To study and determine the various properties of steam with steam generator

3. To study and determine the performance characteristics of Francis Turbine

   a) At different flow rates b) At different guide vane setting
   c) To determine the overall conversion efficiency of fluid to mechanical energy
   d) To compare experimental results with theoretical results

4. To study and determine the performance characteristics of Centrifugal Pump.

   a) To plot a graph between head v/s flow. b) To plot a graph between efficiency v/s flow
   c) To study non dimensional characteristics d) To demonstrate Cavitations

5. To study and determine the performance characteristics of Positive displacement pumps

6. To Study Bourdon tube pressure gauge.

7. To demonstrate and measure the change in friction factor from laminar to turbulent.

8. To study friction loss in pipe .

   a) To investigate laminar and turbulent flow in pipe.
   b) To verify Poiseulle's Equation and the coefficient of viscosity for water in the laminar flow region.

9. Experiments related to A.C. Machines

   a) To demonstrate and measure the change in friction factor from laminar to turbulent.
   b) To determine the Regulation of 3φ Alternator by ZPF Method.
   c) Determination of Regulation of Alternator by EMF and MMF Method.
   d) To determine the performance characteristics of 3φ squirrel cage induction motor by direct loading method.

10. Experiments related to Instrumentation Lab

   a) Study of characteristics of Platinum RTD and Thermistor.
   b) Study of input-output characteristics of LVDT.

c) Study of characteristics of NTC Thermistor.

d) To measure unknown resistance using Wheat stone Bridge

e) To measure unknown inductance, capacitance and resistance using Maxwell Bridge.

Suggested Books:

1. S. Som and G. Biswas, "Introduction to Fluid Mechanics and Fluid Machines", 2nd ed., Tata McGraw-Hill, 2007

2. David A. Bell, Electronic Instrumentation and Measurements, 2nd Ed, PHI, New Delhi, 2008.

3. Y. A. Cengal and M. A. Boles, "Thermodynamics: An Engineering Approach", McGraw Hill, 6th ed. 2008.

Mody University of Science & Technology
Lakshmangarh (Sikar)

Detailed syllabus for First year M. Tech. (Nuclear Science and Technology)

Semester II

Subject Code	Subject	Credits
NU 502	Nuclear Power Engineering	4
NU 504	Plasma Physics and Nuclear Fusion	4
NU 506	Nuclear Engineering Materials	4
NU 508	Fluid dynamics and Heat Transfer	4
NU 510	Radiation Technology and its applications	4
NU 512	Nuclear Measurement Lab	3
NU 514	Plasma Laboratory	1
	Total Credits	**24**

Detailed course syllabus for Second Semester- M. Tech (NST)

NU 502 Nuclear Power Engineering 3-1-0-4

1. Principles of the conversion of nuclear energy to useful power, various types of nuclear power plants that have been designed, built and operated. Advanced future types of nuclear power plants that are in the design or developing stages. **[5]**

2. Reactor designs of power plants, their energy conversion principles, cycles and load-following characteristics, Economics of nuclear vs. other types of power plants. Power plant design and utility industries, reactivity coefficients. **[5]**

3. Problems involving core hydrodynamics of boiling-water reactors, their void and pressure coefficients, stability, and their effects on the design of the balance-of-plant. Detailed features of pressurized water reactor components, including steam generators, pressurizers and chemical-shim control systems, nuclear reactor plant design. **[8]**

4. Problems related to features of gas-cooled reactor cycles and components, and compare/contrast those features with those of conventional LWRs. Examples include, but are not limited to, fuel geometries (hex vs rod vs pebble-bed), fuel type (uranium vs thorium) and coolant type (helium vs water). **[7]**

5. Economics of nuclear power plants, accounting for capital costs, fuel costs and O&M (operations and maintenance) costs, as well as environmental aspects - sustainability, proliferation, safety. Compare and contrast the relative merits of different types of power plants. **[5]**

6. Nuclear Radiation Safety: Integration of reactor physics and engineering sciences into nuclear power plant design. Topics include materials issues in plant design and operations, aspects of thermal design, fuel depletion and fission-product poisoning, and temperature effects on reactivity. Safety considerations in regulations and operations, such as the evolution of the regulatory process, the concept of defense in depth, General Design Criteria, accident analysis, probabilistic risk assessment, and risk-informed regulations. **[10]**

Text Books:

1. M. M. El-Wakil, *Nuclear Energy Conversion,* American Nuclear Society; Revised edition, 1982
2. John R. Lamarsh and Anthony J. Baratta, *Introduction to Nuclear Engineering*, 3rd Edition, Prentice Hall, 2001
3. S. Glasstone & A. Sessonske, *Nuclear Reactor Engineering*, Vol. I and Vol. II , CBS Publishers & Distributors, New Delhi, 2009

2. Beach F., Modern Power Station Practice - Volume D - Electrical System & Equipment, British Electrical International, 3rd ed., Pergamon Press, 1992

NU 504 Plasma Physics and Nuclear Fusion Reactor 3-1-0-4

1. **Introduction to Plasma:** Fourth state of matter, Debye shielding, Collective behaviour, Plasma frequency, Plasma in nature and Laboratory, Ionization and Recombination, Coulomb collision, Diffusion, Ambi polar diffusion, diffusion in magnetic field, Plasma Transport processes, Radiations from plasmas, Plasma Sheath **[10]**

2. **Single particle motions**: Charged particle motion in uniform E and B fields, guiding center approximations, diamagnetism, drift velocities, Adiabatic invariants and magnetic mirrors, particle orbits in Tokamaks **[6]**

3. **Plasma Theory:** Introduction to kinetic theory, Boltzmann equation, Vlasov plasma model, Fluid model from kinetic model, MHD equation, Concept of magnetic pressure, Frozen field lines, Plasma equilibrium and stability analysis **[6]**

4. **Wave propagation in Plasma**: Waves in plasma, electron plasma waves and Landau damping and instabilities in plasma, e. m wave propagation in un magnetized plasma, e. m. wave propagation in a magnetic field, RF plasma heating **[6]**
5. **Fusion power generation**: Fusion cross-sections and consequent conditions required for ignition and energy production, Lawson criterion, Plasma confinement approaches, Open and closed magnetic systems, Tokamak and stellators, ICF **[6]**

6. **Fusion technology**: Plasma heating by neutral beams and RF, Blanket and First wall design, Diverter, ITER project, Safety/ environmental considerations **[6]**

Text Books:

1. F. F. Chen, Introduction to Plasma Physics, 2nd edition, Plenum Press, 1984
2. T. J. Dolan, Fusion Research, Pergamon Press, 1982
3. J. P. Freidberg, Plasma physics and Fusion Energy, Cambridge University Press, 2007

Reference Book:

1. W. M. Stacy , Fusion Plasma Physics, Wiley-VCH, 2001
2. J. A. Bittencourt, Fundamentals of Plasma Physics, 3rd edition, Springer Int. edition, 2004

NU 506 Nuclear Engineering Materials 3-1-0-4

1. **Mechanical Properties of Materials:** Fundamentals of materials, Defects & Diffusion in solids, Dislocations and its effects on materials, Dislocation theory, stress fields, strain energy, Basics of fracture and corrosion in materials **[8]**

2. **Nuclear Fuels:** Extraction process of Uranium, Properties of Uranium metal, UO_2 and UC**.** **[8]**

3. **Fuel elements:** Thermal properties, Stress analysis of fuel elements, Fuel Chemistry, Solid fission products, swelling and fission gas bubbles, Fission gas release, corrosion in nuclear reactors, primary failure modes of fuel elements, fabrication of nuclear fuels, production of heavy water. **[8]**

4. **Radiation damage:** Stages of formation of a displacement cascade, Kinchin-Pease model and various modifications, DPA and DPA rate, computer simulations of radiation damage. **[8]**

5. **Radiation effects:** Fundamentals of phase transformations (nucleation, spinodal decomposition & order-disorder), void swelling and its effects on material properties, theory of radiation-induced segregation and precipitation. **[8]**

Text Books:

1. P. D Wilson., Nuclear Fuel Cycle: From ore to wastes, Oxford Press, 1996
2. M Benedict., T.Pigford and H Levi., Nuclear Chemical Engineering, McGraw-Hill, 1981

Reference Book:

1. Gary Was, Fundamentals of radiation materials science , Springer,2007
2. D. R. Olander., Fundamental aspects of nuclear reactor fuel elements, Report No. TID-26711-P1. Technical Information Center, Office of Public Affairs, Energy Research and Development Administration, Oak Ridge, TN (U.S.A.),1985

NU 508 Fluid Dynamics and Heat Transfer 3-1-0-4

I. Navier-Stokes Equations, Classification of partial differential equations and boundary conditions **[7]**

II. Flow classifications, flow properties, turbulent flow analysis **[6]**

III. Application of FEM & FVM method in heat conduction in multi dimensional system, stability analysis, numerical methods for inviscid flows **[8]**

IV. Viscous laminar flows, compressible flows, turbulent flows, Convection, Conduction and Radiation Heat Transfer **[8]**

V. Critical Thickness of Insulation, Variable Thermal Conductivity, Conduction Heat Transfer with Internal Heat Generation, Heat Exchanger, Pressure Drop Analysis. **[6]**

VI. Fuel, Clad and Coolant Temperatures, Sub channel Analysis of Rod Bundle Fuels, Hotspot and Hot channel Factors, Coolant Channel Orificing, Two-phase Flow and Boiling, Critical Heat Flux **[5]**

Text Books:

1. James George Knudsen, Donald La Verne Katz, Fluid Dynamics and Heat Transfer, Mc Graw Hill, 1958

2. John Grimson, Advanced Fluid Dynamics and Heat Transfer, Mc Graw Hill, 1971

3. M. M. El-Wakil, Nuclear Heat Transport, McGraw Hill Book Co., New York, 1985

4. S. Glasstone & A. Sessonske, Nuclear Reactor Engineering, Vol I and Vol II CBS Publishers & Distributors, New Delhi, 2009

Reference Books:

2. R. T. Lahey and F. J. Moody, The Thermal-Hydraulics of Boiling Water Nuclear Reactor, 2nd Edition, 1993

NU 510 Radiation Technology and its Applications 3-1-0-4

1. Radioisotopes Engineering and Industrial applications

Applications using gamma ray attenuation, Applications using gamma ray scattering, Borehole logging, Radio gauging principles, Alpha particle gauges based on transmissions, Scattering and ionization effects. Beta transmission gauges for measurements of sheets thickness, density and composition analysis. X-ray fluorescence principles, Neutron gauges, Well logging, Gamma and neutron radiography. Radioisotope power packs. High level radio-isotope applications including radiation therapy sterilization plants, radiation processing and food irradiation. **[15]**

2. Medical applications

Projection imaging, imaging with external radiation and internal radiation, computerized tomography, positron emission tomography, magnetic resonance imaging, radiation therapy – using photons and electrons, radionuclides, neutrons and heavy charged particles. **[10]**

3. Nuclear techniques for materials analysis

Basic principles of materials analysis, basic requirements for the technique, nuclear techniques for elemental analysis, main nuclear processes useful for materials analysis, the quantitative estimate, Rutherford back scattering (RBS) and elastic recoil detection analysis(ERDA), Nuclear reaction analysis – principle of the technique and required instrumentation, Nuclear reactions suitable for nuclear reaction analysis, neutron activation analysis, PIXE and XRF techniques. **[15]**

Text Books:

1. G. Foldiak, *Industrial Application of Radioisotopes*, Elsevier, New York, 1986.
2. Robin P. Gardner and R. L. Ely, *Radioisotope Measurement & Applications in Engineering,*
3. G. A. Johanson and Peter Jackson., *Radioisotope Gauges for Industrial Process Measurement,* John Wiley & Sons.

Reference Books:

1. G. Faure and T. M. Mensing, *Isotopes Principles and Applications*, John Wiley & Sons
2. John Lilley, *Nuclear Physics, Principles and Application*, John Wiley, 2002

NU 512 **Nuclear Measurement Lab** **0-0-6-3**

List of experiments

1. Characteristics and dead time of a G.M. counter. Counting statistics using a GM counter.
2. Gamma ray absorption in lead/aluminum using a GM counter.
3. Determination of end point energy of β–particles by absorption method using a GM counter.
4. Determination of half-life of 116 In using a GM counter.
5. Determination of gamma-ray energy by using a scintillation detector.
6. Determination of the energy resolution of a Si-surface Barrier detector with an 241Am alpha-source.
7. Determination of beta end-point energy from Fermi-Curie plot using an Anthracene scintillation detector.
8. Determination of the photo peak efficiency of a NaI (Tl) scintillation detector as a function of gamma ray energy.
9. Determination of the energies of gamma rays using an HPGe detector.
10. Study of γ-γ directional correlation using a 60Co source and a pair of scintillation detectors.
11. Study of angular distribution of Compton scattered gamma rays using a scintillation spectrometer and deduction of total scattering cross section.
12. Determination of rest mass of electron by measuring the energy of Compton scattered gamma rays using a scintillation spectrometer.

.

1. G.F. Knoll, *Radiation Detection and Measurement*, 3rd Edition, John Wiley and Sons, 2000
2. S. S. Kapoor and V. S. Ramamurthy, *Nuclear Radiation Detectors*, Wiley Eastern Limited, New Delhi, 1986
3. William R. Leo, *Techniques for Nuclear and Particle Physics Experiments: A How-to Approach*, 2nd revised edition, Springer-Verlag, New York Inc., 1994

NU- 514 **Plasma Laboratory** **0-0-2-1**

List of Plasma Experiments

1. Glow discharge characteristic- Paschen curve
2. Density and electron temperature measurement using Langmuir probes in the glow Discharge
3. To study the conditions of striations in Plasma
4. Plasma confinement studies using magnetic field
5. Dielectric barrier discharge- plasma generation at atmospheric pressure
6. Ion acoustic wave propagation in plasma

Mody University of Science & Technology
Lakshmangarh (Sikar)

Detailed syllabus for Second year M. Tech. (Nuclear Science and Technology)

Semester III

Subject Code	Subject	Credits
NU 601	Fast Breeder Reactor	3
NU 603	Nuclear Waste storage and Management	3
NU 605	Nuclear security, safety and safeguards	3
NU 607	Seminar	2
NU 609	Preliminary Dissertation	10
	Total Credits	**21**

NU-601 Fast Breeder Reactor 2-1-0-3

1. **Core Physics:** criticality, control rod calculations, excess reactivity computations, enrichment requirements, fuel burn-up and fission product formation. [5]
2. **Thermal Hydraulics**: convective and/or boiling heat transfer at fuel element surface, conductive heat transfer inside elements, pressure drops, heat exchanger calculations, thermodynamic cycle efficiency, steam turbine reheat and regeneration, preheating and inlet sub cooling, fuel chemistry. [4]
3. **Materials:** selection of fuel and cladding, corrosion, pressure vessel materials, post irradiation examination of nuclear fuels. [3]
4. **Pressure Vessel:** stress calculations, materials selection/thicknesses, ASME codes. [3]
5. **Safety:** Safety design principles, Safety in operation, temperature and void coefficients, emergency cooling, hazards considerations. Thermal limits on reactor performance, thermal converters, and fast breeders. [4]
6. **Fast breeder Reactor:** Breeding requirements and fast reactors, Fast reactor system features, Oxide fuels in fast reactors, Carbide/Nitride fuels in fast reactors, Metal fuel development (emphasis on U-Pu-Zr), Zr-Nb applications in reactors. [3]
7. **Fast reactor physics**, Four-group flux and adjoint flux distributions, Reactivity and stability, System response to accident initiators, Fast reactor thermal hydraulics: sodium heat transfer, Natural circulation in fast reactors, SGTR mitigation. [3]
8. Solve problems related to conversion, breeding and doubling times of fast breeder reactors. Difference in neutron spectrum and fuel type between a fast reactor and a LWR affect fast reactor physics and performance. Examples include, but are not limited to, fast reactor kinetics, sodium void coefficients and designs to suppress reactivity excursions. Describe methods of direct nuclear energy conversion such as thermionic, thermoelectric, betavoltaic and fission-electric cells. [5]

Text Books:

3. A.E. Bergles et al., *Two Phase Flow and Heat Transfer in the Power and Process Industries*, Hemisphere Publishing (1981).
4. J.C. Collier, *Convective Boiling and Condensation*, McGraw Hill (1972).

NU–603 Nuclear Waste Storage and Management 2-1-0-3

1. **Introduction to Nuclear Radioactive Waste:**
   Nuclear decay law, naturally occurring radioactive materials, background radiation, nuclear fuel cycle **[5]**

2. **Nuclear Waste and Classification:**
   Low, intermediate and high level nuclear waste, Short-lived waste radionuclides and long-lived waste radionuclides, high-level waste from reprocessing of spent fuel **[5]**

3. **Treatment of Radioactive Waste:**
   Pre-treatment of radioactive wastes, treatment of liquid and solid radioactive wastes, hydraulic cements in waste immobilization and cementation technology. **[5]**

4. **Radioactive waste immobilization:**
   Vitrification technology, long term durability of silicate glasses, Ceramic and metallic matrices **[4]**

5. **Nuclear waste storage and disposal:** Deep geologic disposal, Repository Requirements and site selection, The multi-barrier concept, Design principles and evaluation methods for geologic waste disposal systems, Regulatory environment and community Issues, International scenarios for permanent disposal **[6]**

6. **Nuclear Waste radionuclide migration in environment**: Fundamental processes and governing equations of radionuclide transport in the environment. Potential environmental impact and assessment of overall Repository performance **[5]**

Text Books:

1. R. L. Murray, *Understanding Radioactive Waste*, 4th edition, Battelle Press, 1994

Reference Book:

2. Arnold P. Lattefer, *Nuclear Waste Research, Nova Science* Publishers Inc (2008-07-30)

NU-605 Nuclear Security, Safety and Safeguards 2-1-0-3

Unit I

Introduction to nuclear security; International and national legal framework regulating of nuclear security; Vulnerability assessment of physical protection systems; Risk assessment and management of State nuclear security measures; Threat assessment; **[5]**

Unit II

Physical protection systems design and evaluation; Physical protection technologies and equipment; Transport security for nuclear and other radioactive material; Nuclear forensics, Nuclear security culture. **[8]**

Unit III

Nuclear security at major public events; Infrastructure and procedures for detection and response to incidents involving nuclear or other radioactive material out of regulatory control; Cooperation of stakeholders at national and international level; IT/cyber security. **[8]**

Unit IV

Nuclear power plant safety requirements, Basic concepts in safety and reliability, Conceptual design of safety systems, Risk and reliability analysis of systems, PSA, DSA, Nuclear Safeguard, Nuclear material accountancy and inventory control of radioactive material.

[9]

Text Books:

1. E. E. Lewis, Nuclear Power Reactor Safety, **Wiley-Inter science** publication, 1977

List of Electives

Elective I

1. CS 563 Advances in Distributed Computing
2. CS 565 Advanced Compiler Construction
3. CS 567 BioInformatics
4. CS 569 Advanced Computer Graphics
5. CS 571 Advances in Algorithm Design

Elective II

1. CS 572 Web Service Security
2. CS 574 Mobile and Wireless Security
3. CS 576 Information Security Policies
4. CS 578 Operating System and Mobile Application Security
5. CS 580 Biometric Security

Total Lectures: 40

CS 509 High Performance Computer Architecture 3-1-0-4

1. Overview: Necessity of high performance, Constraints of conventional architecture, Parallelism in uniprocessor system, Evolution of parallel processors, future trends, Architectural Classification, Applications of parallel processing, Instruction level Parallelism and Thread Level Parallelism, Explicitly Parallel Instruction Computing (EPIC) Architecture, Performance Metrics and Measures, Speedup Performance Laws. [6]

2. Pipeline Architecture: Principles and implementation of Pipelining, Classification of pipelining processors, General pipelining reservation table, Design aspect of Arithmetic and Instruction pipelining, Pipelining hazards and resolving techniques, Data buffering techniques, Job sequencing and Collision, Advanced pipelining techniques, loop unrolling techniques, out of order execution, software scheduling, trace scheduling, Predicated execution, Speculative loading, Register Stack Engine, Software pipelining. [8]

3. Vector and Array Processor: Basic vector architecture, Issues in Vector Processing, Vector performance modeling, vectorizers and optimizers, SIMD Computer Organization Masking and Data network mechanism, Inter PE Communication, Interconnection networks of SIMD, Static Vs Dynamic network, cube, hyper cube and Mesh Interconnection network. Parallel Algorithms for Array Processors. [8]

4. Multiprocessor Architecture: Loosely and Tightly coupled multiprocessors, Processor characteristics of multiprocessors, Inter Processor communication network, Time shared bus, Crossbar switch, Multiport Memory Model, Memory contention and arbitration techniques, Cache coherency and bus snooping, Massively Parallel Processors (MPP), Processor, Inter Processor Communication and Synchronization. [8]

5. Multithreaded Architecture: Multithreaded processors, Latency hiding techniques, Principles of multithreading, Issues and solutions. [4]

6. Parallel Programming Techniques: Message passing program development, Synchronous and asynchronous message passing, Message passing parallel programming, Shared Memory Programming, Data Parallel Programming. [6]

Text Books:

1. Kai Hwang, Faye A. Briggs, "Computer Architecture and Parallel Processing", McGraw Hill International Edition, 2004.
2. Kai Hwang, "Advanced Computer Architecture", Tata McGraw Hill Edition, 2001.

Reference Book:

1. William Stallings, "Computer Organization and Architecture, Designing for performance" Prentice Hall, Sixth Edition, 2003.1

Total Lectures: 40

CS 511 Adhoc Sensor Networks 3-1-0-4

1. Ad hoc Networks: Introduction and Definitions, Ad hoc Network Applications, Design Challenges. [3]

2. Routing in Mobile Ad hoc Networks: Introduction, Flooding, Proactive Routing, On Demand Routing, Proactive Versus on demand Debate, Location based Routing. [4]

3. Multicasting in Ad hoc Networks: Introduction, Classifications of Protocols, Multicasting Protocols, Broadcasting. Protocol Comparisons, Overarching Issues. [4]

4. Transport layer Protocols in Ad hoc Networks: Introduction, TCP and Ad hoc Networks,Transport Layer for Ad hoc Networks: Overview, Modified TCP, TCP-aware Cross-layered Solutions. Ad hoc Transport Protocol. [5]

5. QoS Issue in Ad hoc Networks: Introduction, Definition of QoS, Medium Access Layer, QoS Routing, Inter- Layer Design Approaches. [4]

6. Security in Mobile Ad hoc Networks: Vulnerabilities of Mobile Ad hoc Networks, Potential Attacks, Attack Prevention Techniques. Intrusion Detection Techniques. [4]

7. Overview of Wireless Sensor Networks (WSNs): Introduction, Constraints and Challenges, Advantages of Sensor Networks, Sensor Network Applications. [2]

8. Routing Protocols: Geographic, Energy-Aware Routing – Unicast Geographic Routing, Routing on a Curve, Energy-Minimizing Broadcast, Energy-Aware Routing to a Region; Attribute-Based Routing – Directed Diffusion, Rumor Routing. [8]

9. Security in WSNs: Introduction: IEEE 802.11b Security Mechanisms, WEP Security Issues, WEP Improvements, Wireless Security Threats and Risks: Types of Security Threats, Physical Security of Wireless Devices, WLAN Attacks. Risk Mitigation and Countermeasures: Basic Countermeasures, AAA Infrastructure Solutions, Additional Enhancements. [6]

Text Books:

1. Prasant Mohapatra and Srihanamurthy, “Ad Hoc Networks Technologies and Protocols”, Springer, Springer International Edition, 2009.
2. Kazem Sohraby, Daniel Minoli, Taieb Znati, “Wireless Sensor Networks”, John Wiley & Sons, Inc., Publication, 2007.
3. Zhao, Guibas, “Wireless Sensor Networks” , Elsevier, 2004.

Reference Book:

1. A.Boukereche, “Handbook of Algorithms for Wireless Networking and Mobile Computing”, Chapman and Hall/CRC Computer and Information Science Series, 2007.

Total Lectures: 40

CS 513 Cryptography and Information Security 3-1-0-4

1. Introduction: Elements of Information Security, Category of computer securities, types of attacks and services. [4]

2. Cryptographic Techniques: plain text and Cipher text, Encryption and Decryption, Stenography, Symmetric and Asymmetric key Cryptography, Blowfish, Data encryption standard, (DES), Advanced Encryption Standard(AES) [6]

3. Number Theory: Introduction to ring and field, prime and relative prime numbers, modular arithmetic, Fermat's and Euler's theorem, primality testing, Euclid's Algorithm, Chinese Remainder theorem, discrete logarithms. [4]

4. Public key Cryptography: Public Key Cryptography and RSA, Key Management, Diffie-Hellman key Exchange, Elliptic Curve Architecture and Cryptography. [5]

5. Message Authentication and Hash Function: Authentication requirements, authentication functions, MAC, hash functions, MD5, SHA, Digital Signatures: Digital Signatures, authentication protocols, Digital certificates, Kerberos, Certificate authority. [9]

6. Information attacks: Recognizing Security Threats and countermeasure for Phishing, Virus, Trojan Horse, Worms, Spyware, Adware, Key logger, Denial of Service, Spamming, Port Scanning and Password cracking [4]

7. Web and IP Security: Secure Socket Layer(SSL), Secured Hyper Text Transfer Protocol (SHTTP), S/MIME, IP security overview, Authentication Header(AH), Encapsulating Security Payload(ESP), IP key management . [6]

8. Case study: IP spoofing attack, Cyber Laws. [2]

Text Book:

1. William Stallings, "Cryptography and Network Security – Principles and Practices", Prentice-Hall of India, 4/E edition, 2003.

Reference Books:

1. VK Pachghare, "Cryptography & Information Security", PHI, 2009
2. Atul Kahate, "Cryptography and Network Security", Tata McGraw-Hill, 2003.

Total Lectures: 40

MA 531 Advanced Computational Mathematics 3-0-0-3

1. Calculus of Finite Differences and Interpolation: Finite differences and difference operators, Construction of difference tables, Interpolation and extrapolation with equal intervals (Newton- Gregory forward, backward, Stirling and Bessel's formula), Interpolation and extrapolation with unequal intervals (Newton's divided difference and Lagrange's formula). [08]

2. Numerical Differentiation and Integration: Numerical differentiation with equal and unequal intervals, numerical integration (newton-Cotes quadrature formula, Trapezoidal, Simpson's 1/3, Simpson's 3/8, Weddle's and Romberg rules), Double and triple integration using Trapezoidal and Simpson's rules. [07]

3. Numerical Solution of Simultaneous Equations: Gauss elimination method (Partial Pivoting), Jacobie's iteration method, Gauss Jordan method, Gauss Siedel iteration method. [4]

4. Numerical Solution of Algebraic and Transcendental Equations: Bisection method, Regular falsi method (method of false position), Newton Raphson method and its applications, Graeffe's root squaring method with error analysis.

[4]

5. Numerical Solution of Ordinary and Partial Differential Equations: Numerical solution of ordinary differential equations of first order and first degree using Picard's, Taylor series, Euler, Euler's modified, Runge-Kutta method of fourth order and Milne's Predictor -Corrector method.
Classification of partial differential equations (elliptic, parabolic, and hyperbolic). Finite difference approximations to partial derivatives. Jacobi and Gauss Siedel method, Crank - Nicolson method, Solution of Laplace and Poisons equations. [10]

6. Linear Algebra: Review of group, ring and field , Vector Spaces, Subspaces, Linearly dependent and independent, Basis, Dimensions, Isomorphism, Linear transformations and their matrix representations , Rank, Inverse of Matrices, Cauchy- Schwarz inequality, Eigenvalue, Eigenvectors. [07]

Text Books:

1. M.K. Jain, Numerical Methods for Scientific and Engineering Computation, New Age International, 2012.
2. B.S. Grewal, Numerical Methods, BPB publication, 2012.
3. Introduction to Linear Algebra with applications by Jim Defranza and Daniel Gagliardi, TMH, Year 2013.

Reference Books:

1. Numerical Mathematics Analysis by James B. Scarborough.
2. Introduction Methods of Numerical Analysis by S.S. Shastry.
3. Applied Numerical methods with MATLAB by Steven C Chapra, TMH.
4. Introduction of Numerical Analysis by Forberg.
5. V. Rajaraman Computer oriented numerical methods 3rd edition PHI – 2012
6. Linear Algebra and Its applications by David C. Lay, Addison- Wisley(An imprint of Pearson education).

CS 517 Adhoc Sensor Networks Laboratory 0-0-2-1

1. Basics of Network Simulation
2. Simulating a Local Area Network
3. Measuring Network Performance
4. Simulation of a Satellite Network
5. Simulating a Wi-Fi Network
6. Simulating a Wi-MAX Network
7. Simulating a Mobile Ad-hoc Network
8. Simulating a Wireless Sensor Network
9. Setting up a Bluetooth Network
10. Setting up a Zig-Bee Network

CS 519 Cryptography and Information Security Lab 0-0-2-1

1. Implementation of Ciphers
a) Play fair
b) Hill cipher

2. Implementation of the concepts from number theory
a) Fermat's & Euler's Theorem
b) Primality testing
c) Chinese Remainder Theorem

3. Implementation of Symmetric key algorithms like AES/ DES

4. Implementation of Asymmetric key Algorithms like RSA/ DSA.

5. Implementing hash code using MD5/SHA. And generate digital signature

6. Generation of Virus.

MA 533 Advanced Computational Mathematics Laboratory 0-0-2-1

Implement the following in C/C++/MATLAB:

(1) Newton-Gregory's formulae for forward and backward interpolation.
(2) Stirling formula.
(3) Bessel's formula.
(4) Newton's divided difference formula.
(5)Lagrange's formula.
(6) Numerical differentiation.
(7) Numerical integration: Newton –Cotes quadrature formula..
(8) Trapezoidal rule.
(9) Simpson rules.
(10) Romberg rules.
(11) Solution of differential equations by Euler's method modified Euler's method.
(12) Runge-Kutta method.
(13) Milne's Predictor-Corrector method.
(14) Bisection method
(15) Regula Falsi method
(16) Newton – Raphson method.
(17) Graeffe's root squaring method.
(18) Gauss elimination method (with partial pivoting).
(19) Eigen values and eigen vectors.
(20) Solution of partial differential equations.

Total Lectures: 40

CS 530 Network Security 3-1-0-4

1. **Introduction to Security in Networks**: Characteristics of Networks, Intrusion, Kinds of security breaches, Plan of attack, Points of vulnerability, Methods of defense, Control measures, Effectiveness of controls [6]

2. **Sniffers**: Passive Sniffing, Active Sniffing, Ethereal tool, Man-in-the-Middle Attacks, Spoofing and Sniffing Attacks, ARP Poisoning and countermeasures. [6]

3. **Denial of Service:** Denial of Service, Goal of DoS (Denial of Service), different types of attacks and their impacts, securing from these attacks. [10]

4. **Secure Sockets:** IPsec overview – IP security architecture, IPsec-Internet KeyExchanging (IKE), IKE phases – encoding , Internet security, Threats to privacy , Packet sniffing ,Spoofing - Web security requirements, Real Time communication security, Security Standards–Kerberos.X.509 Authentication Service. [9]

5. **Security Protocols:** Transport layer protocols – SSL, Electronic mail security – PEM and S/MIME security protocol, Pretty Good Privacy , Web Security, Firewalls design principles , Trusted systems-Electronic payment protocols, Intrusion detection, password management Viruses and related Threats, Virus Counter measures, Virtual Private Networks. [9]

Text Book:

1. William Stallings, "Cryptography and Network Security: Principles and Standards", Prentice Hall India, 3rd Edition, 2003.

Reference Books:

1. Charlie Kaufman, Radia Perlman and Mike Speciner, "Network Security: Private Communication in a public world", Prentice Hall India, 2nd Edition, 2002.

2. Charles P. Pleeger, "Security in Computing", Pearson Education Asia, 5th Edition, 2001.

Total Lectures: 40

CS 532 Cyber Forensic 3-0-0-3

1. Incident and Incident Response : Introduction to Incident - Incident Response Methodology – Steps - Activities in Initial Response Phase after detection of an incident. [10]

2. Initial Response and Forensic Duplication: Initial Response & Volatile Data Collection from Windows system – Initial Response & Volatile Data Collection from Unix system - Forensic Duplication: Forensic duplication: Forensic Duplicates as Admissible Evidence, Forensic Duplication Tool Requirements, Creating a Forensic Duplicate/Qualified Forensic Duplicate of a Hard Drive. [10]

3. Storage and Evidence Handling: File Systems-FAT,NTFS - Forensic Analysis of File Systems – Storage Fundamentals-Storage Layer, Hard Drives Evidence Handling-Types of Evidence, Challenges in evidence handling, Overview of evidence handling procedure. [10]

4. Network Forensics: Collecting Network Based Evidence - Investigating Routers - Network Protocols - Email Tracing - Internet Fraud. [10]

Text Books:

1. Kevin Mandia, Chris Prosise, “Incident Response and computer forensics”, Tata McGraw Hill, 2006.
2. Peter Stephenson, “Investigating Computer Crime: A Handbook for Corporate Investigations”, Sept 1999.

Reference Books:

1. Eoghan Casey, "Handbook Computer Crime Investigation's Forensic Toolsand Technology", Academic Press, 1st Edition, 2001.
2. Skoudis. E., Perlman. R. Counter Hack: “A Step-by-Step Guide to Computer Attacks and Effective Defenses”, .Prentice Hall Professional Technical Reference. 2001.
3. Norbert Zaenglein, “Disk Detective: Secret You Must Know to Recover Information From a Computer”, Paladin Press, 2000.
4. Bill Nelson, Amelia Philips and Christopher Steuart, “Guide to computer forensics and investigations”, course technology, Cengage Learning; 4thedition, ISBN: 1-435-49883-6, 2009.

Total Lectures: 40

CS 534 Image Information Processing 3-1-0-4

1. **Introduction:** Basics regarding Digital Images, elements of digital image processing systems, different image formats, elements of visible perception ,image model, sampling, quantization, image enhancement, restoration and analysis. [10]
2. **Mathematical Preliminaries and Image Transforms**: Matrix theory, random signals, spectral density function, results from estimation and information theory, Introduction to DFT, 2-DFT, FFT and other transforms such as Walsh, Hadamard, discrete cosine, Haar, slant and KL . [10]
3. **Image Data Compression:** Basic compression techniques such as Huffman coding, arithmetic coding, LZ77, LZ78, Predictive techniques –PCM , DPCM, transform coding theory of images, hybrid coding and vector DPCM, Introduction to speech and video compression, MPEG ,packet video. [10]
4. **Visual Cryptography:** Introduction to information hiding, surveys of different Steganographic and Watermarking techniques, principles of Steganography and water marking techniques, Statistical Steganography- distortion code generation techniques. Detecting, extracting and disabling hidden information, Basic principles , applications, evaluation and benchmarking of water marking systems, Extension from still images to video, Fingerprints classification and analysis. [10]

Text Books:

1. R.C. Gonzalez , "Image Processing" Pearson education 4th edition , 2013.
2. A.K. Jain ,"Fundamentals of Digital Image Processing " PHI 2nd edition , 1995.

Reference Books:

6. W.K.Pratt ,"Digital Image Processing",John Willey and Sons,1994 .

Total Lectures: 40

CS 536 Database Security 3-1-0-4

1. Introduction: Introduction to Databases Security, problems in Databases Security Controls. Security Models**:** Introduction, Access Matrix Model, Take-Grant Model, Acten Model, PN Model, Hartson and Hsiao'sModel, Fernandez's Model, Bussolati and Martella's Model for Distributed databases. [7]

2. Advanced Models: Bell and La Padula's Model, Biba's Model, Dion's Model, Sea View Model Jajodia and Sandhu's Model, The Lattice Model for the Flow Control. [6]

3. Security Mechanisms: User Identification/Authentication, Memory Protection, Resource Protection Control Flow Mechanisms, Evaluation Criteria [6]

4. Security Software Design: A Methodological Approach to Security Software Design, Secure Operating System Design, Secure DBMS Design, Security Packages, Database Security Design. [7]

5. Statistical Database Protection and Intrusion Detection System: Statistics Concepts and Definitions, Types of Attacks, Inference Controls evaluation, Criteria for Control, Comparison, IDES System, RETISS System, ASES System. [7]

6. New Generation Database Systems Protection Models: Model for the Protection of Frame Based Systems, Object Oriented Systems, SORION Model for Object-Oriented Databases. Orion Model, Jajodia and Kogan's Model. [7]

Text Books:

1. Database Security and Auditing, Hassan A. Afyouni, India Edition, CENGAGE Learning, 2009.

2. Database Security, Castano, Second edition, Pearson Education.

Reference Book:

1. Database security, Alfred Basta, Melissa Zgola, CENGAGE learning.

CS 538 Network Security Laboratory 0-0-2-1

1. Implementation of Diffie –Hellman algorithm.
2. Implementation of X.509 certificate.
3. Implementation of IP Architecture.
4. Implementation of Authentication Services.
5. Implementation of E-mail Security protocols.

CS 540 Image Information Processing Laboratory 0-0-2-1

(Implement the following programs in MatLab)

1. Write a program to generate mirror and flipped image of a given image.
2. Write a program by taking 2 similar size images and do image addition and subtraction.
3. Write a program to perform logical operators on a given image.
4. Write a program for geometrical transformation of a given image.
5. Write a program for histogram calculation and equalization (without using standard functions).
6. Write a program for image compression.
7. Write a program for color image processing.
8. Write a program for image frequency domain filtering.
9. Write a program for image frequency domain filtering.
10. Write a program for image morphology.
11. Write a program for Image Restoration.
12. Write a program for Edge detection.
13. Write a program for Blurring 8 bit color versus monochrome.
14. Write a program to implement LZ77 and LZ78 algorithm.
15. Write a program to implement Image Steganography.
16. Write a program to Watermark the given Image.

CS 542 Database Security Laboratory 0-0-2-1

1. Introduction to Database Security and Concepts and Architecture.
2. Implementing Operating System Security.
3. Learning User creation and Administration.
4. Creating Profiles, Passwords, privileges and Roles.
5. Implementing Security Models for Database Applications.
6. Implementing Virtual private databases.
7. Implementing Database Auditing Models.
8. Auditing Database Activities
9. Security and Auditing project Cases.

Total Lectures: 52

CS 563 Advances in Distributed Computing 4-0-0-4

1. **Introduction:** Distributed Systems, Cluster Computing, Supercomputing, Cloud Computing. [6]
2. **Synchronous networks:** Leader election in synchronous ring networks. Leader election in rings. Basic computational tasks in general synchronous networks: leader election. [6]
3. **Fault-tolerant Systems:** Consensus, Link failures: the two generals problem. Process failures (stopping, Byzantine). Algorithms for agreement with stopping and Byzantine failures. Exponential information gathering. [6]
4. **Asynchronous distributed computing**: Formal modeling of asynchronous systems using interacting state machines (I/O automata). Proving correctness of distributed algorithms. [6]
5. **Non-fault-tolerant Systems:** Algorithms for asynchronous networks. Leader election. [4]
6. **Synchronizers**. Synchronizer applications. Synchronous vs asynchronous distributed systems. [6]
7. **Time, clocks and the ordering of events**: State-machine simulation. Vector timestamps. Stable property detection. Distributed termination. Global snapshots. Deadlock detection [6]
8. **Asynchronous shared-memory systems**: The mutual exclusion problem. Mutual exclusion algorithms. Bounds on shared memory for mutual exclusion. Resource allocation. The Dining Philosophers problem. [6]
9. **Locking:** Locking algorithms, optimistic algorithms, lock-free algorithms, lazy algorithms, Load scheduling and balancing techniques. [6]

Text Books:

1. Lynch, Nancy, "Distributed Algorithms", Burlington, MA: Morgan Kaufmann, 1996. ISBN: 9781558603486.
2. George Coulouris, Jean Dollimore, Tim Kindberg, "Distributed Systems, Concept and Design", 3rd Edition, Pearson Education, 2005.
3. Mukesh Singhal, Niranjan G. Shivaratri, Niranjan Shivaratri, "Advanced Concepts in Operating Systems", TMH, 1994.
4. Sunita Mahajan, Seema Shah, "Distributed Computing", Oxford University Press,2010.

Reference Books:

1. Sukumar Ghosh, "Distributed Systems: An Algorithmic Approach", Chapman &Hall / CRC, 2007.
2. Pradeep K. Sinha, "Distributed Operating Systems: Concepts and Design", PHI, 2007.
3. Randy Chow, Theodore Johnson, "Distributed Operating Systems and Algorithm Analysis", Pearson, 2009.

Total Lectures: 52

CS 565 Advanced Compiler Construction 4-0-0-4

1. **Advanced Issues in Elementary topics:** Compiler, phases and passes, finite state machines, regular expressions and their applications to lexical analysis, implementation of lexical analyzer using LEX, CFG, bottom-up and top-down parsers, implementation of parsers using YACC. [10]

2. **Symbol Table Structure**: Storage classes, visibility and lifetime. Symbol attributes and symbol table entries, local symbol table management, and global symbol table structure, storage binding and
symbolic registers. [6]

3. **Intermediate Representations**: Issues in designing intermediate languages, High level, medium level, low level and multi-level intermediate languages. Representing all intermediate languages in informal compiler algorithm notation (ICAN). [8]

4. **Code Optimization**: Introduction, early optimization, redundancy elimination. Loop optimization: Induction variable optimizations, bounds checking elimination.Procedure optimization: Tail-call optimization and Tail-recursion optimization, procedure integration, In-line expansion, leaf routine optimization and shrink wrapping. [8]

5. **Register Allocation**: Register allocation and assignment, local methods, graph coloring, priority based graph coloring. Code Scheduling: Instruction Scheduling, Speculative loads and boosting, speculative scheduling, trace scheduling, percolation scheduling. [8]

6. **Interprocedural Analysis and Optimization**: Call graph, interprocedural data flow analysis, constant propagation, alias analysis, optimizations and register allocation. [7]

7. **Automatic Code Generators**: Syntax directed technique, semantic directed parsing, tree pattern matching and dynamic programming. [5]

Text Book:

1. Steven S. Muchnik, "Advanced Compiler Design Implementation", Morgan Kauffman publishers, 2005.

Reference Books:

1. Alfred Aho, Monica Lam, Ravi Sethi, Jeffrey Ullman, "Compilers: Principles, Techniques, and Tools", Second edition, Addison-Wesley, 2006.

2. Fisher, Faraboschi, Young, "Embedded Computing - A VLIW Approach to Architecture, Compilers, and Tools", Morgan Kaufmann, 2005.

Total Lectures: 52

CS 567 BioInformatics 4-0-0-4

1. Introduction to Bioinformatics: Definition and History of Bioinformatics, Internet and Bioinformatics, Introduction to Data Mining, Applications of Data Mining to Bioinformatics Problems and Applications of Bioinformatics. [6]

2. Bioinformatics Databases: Introduction, Nucleotide sequence database - Protein sequence databases, Sequence motif databases, Protein structure databases, other relevant databases. [6]

3. Data storage and retrieval and Interoperability: Flat files, relational, object oriented databases and controlled vocabularies. File Format (Genbank, DDBJ, FASTA, PDB, SwissProt).Introduction to Metadata and search; Indices, Boolean, Fuzzy, Neighboring search.The challenges of data exchange and integration. Ontologies, interchange languages and standardization efforts.General Introduction to XML, UMLS, CORBA, PYTHON. [13]

4. Sequence Alignments and Visualization: Introduction to Sequences, alignments and Dynamic Programming; Local alignment and Global alignment (algorithm and example),Pairwise alignment (BLAST and FASTA Algorithm) and multiple sequence alignment (Clustal W algorithm).Methods for presenting large quantities of biological data: sequence viewers (Artemis, SeqVISTA), 3D structure viewers (Rasmol, SPDBv, Chime, Cn3D, PyMol), Anatomical visualization. [12]

5. Bioinformatics Softwares: Clustal V, Clustal W 1.7, RasMol, Oligo, Molscript, Treeview, Alscript, Genetic Analysis Software, Phylip. [5]

6. Semantic Web Techniques: Bridging databases, browsing space of information, life sciences identifiers, RDF data representation. [5]

7. Bioinformatics and Distributed Computing: Java Distributed computing platform, DPRml, DSEARCH. [5]

Text Books:

1. Dan E. Krane ,"Fundamental Concepts of Bioinformatics", third edition, Pearson Education, 2009.
2. Claverie, J.M. and Notredame C. ," Bioinformatics for Dummies", Wiley Editor , January 2003.

Reference Book:

1. ShaliniSuri, "Bioinformatics", APH Publishing Corporation, 2006.

Total Lectures: 52

CS 569 Advanced Computer Graphics 4-0-0-4

1. **Animation:** Introduction of computer Animation, Principles of Animation, Key framing , Kino-dynamics Planning- motion blending, skinning-skeleton animation, rigid skinning ,linear skinning, dual skinning, physics modeling-Physics-based animation, rigid body systems, articulated rigid bodies, forward and inverse dynamics. [14]

2. **Rendering:** Basic concepts of graphics models-illumination& reflection models Shading-Scanning polygons, Gourad and Phong shading ,texture mapping- bump & environmental maps , mipmaps , shading languages-vertex shedders and fragment shedders. [12]

3. **Modeling:** Representation, Using homogeneous Coordinate systems, Modeling process, terrain-representation, methods , fault formation & weather, plants modeling , animals modeling. [12]

4. **Surface Representation:** 3 dimensional object representation –polygon representations, implicit representation , Beziers ,B-splines-basis function, knot insertion, conversion , rational B-splines (NURBS)-properties and examples , evaluators, subdivision surfaces-coarse mesh and subdivision rule,types of subdivisions , Voxels . [14]

Text Book:

1. Peter Shirley, Stephen Robert Marschner, "Fundamentals of Computer Graphics" , A K Peters Limited, 2009.

Reference Books:

1. Shreiner Dave, "Opengl Programming Guide: The Official Guide To Learning Opengl", Version 2.1, 6/E , Pearson Education India, 2008.
2. Francis S. Hill, Jr., Stephen M. Kelley , "Computer Graphics: Using OpenGL" , Pearson Prentice Hall, 2008
3. James D.Foley, Andries van Dam, Steven K. Feiner, John F. Hughes , "Computer Graphics ,Principles & Practice", 3rd Edition, Pearson Prentice Hall, 2013.
4. Edward Angel, "Interactive Computer Graphics a top-Down Approach using openGL", 5th Edition Pearson Prentice Hall, 2008.

Total Lectures: 52

CS 571 Advances in Algorithm Design 4-0-0-4

1. Pattern matching algorithms: Finite automata and regular expression, recognition of regular expression patterns, recognition of substrings, Two – way deterministic pushdown automata, position trees and substring identifiers. [11]

2. Computability theory: Turing machines, variants of Turing machines, Hilbert's problem, decidable languages, the halting problem, Un-decidable problems from language theory, mapping reducibility, the recursion theorem, decidability of logical theories, Turing reducibility, definition of information. [11]

3. Fast Fourier Transform and Polynomials: Representation of polynomials, the DFT and FFT algorithms, efficient FFT implementation, the FFT using bit operations, products of polynomials, the Schonhage – Strassen integer multiplication algorithm. [11]

4. Randomized Algorithm and Parallel Algorithm: Monte-Carlo algorithm, Las-Vegas algorithm, Game tree evaluation, De-randomization. Models for parallel computation basic techniques; Parallel matrix algorithms: matrix-vector multiplication, matrix multiplication, triangular system solution, sorting networks-parallel merging networks, zero –one principle. [8]

5. Complexity theory: Time complexity, the classes P, NP, NP complete and NP hard, Hierarchy theorems, Relativization, Circuit Complexity, approximation algorithms, probabilistic algorithms, circuit complexity, alteration, interactive proof systems, parallel computation, cryptography. [11]

Text Book:

1. Aho Alfred V., Hopcraft John E., Ullman Jefferey D. "The design and analysis of computer algorithms" Pearson education, tenth impression 2012.

Reference Books:

1. Cormen Thomas H. "Introduction to algorithms" PHI, Third edition – 2012.

2. MICHAEL SIPSER Sipser Michael, "Introduction to the theory of computation" Thomson press, Third edition 2012.

3. Brassard G. Fundamental of Algorithmcs, Prentice-Hall of India, 2003.

4. Horowitz E. Computer Algorithms, Galgotia Publications, 2002.

Total Lectures: 52

CS 572 Web Services Security 4-0-0-4

1. Introduction to web Service Technologies: Introduction to web services, Security for Web Services and Security Goals, Need of security and Privacy in web services, applications of web service security, SOA and Web Services Principles, Web Services Architecture, Web Services Technologies and Standards, SOAP, Web Services Description Language (WSDL). [10]

2. Web Service Threats Vulnerabilities, and Countermeasures: Threats and Vulnerabilities, Threats Modelling, Vulnerability Categorizations and Catalogs, Threats and Vulnerabilities Metrics. [10]

3. Standards for Web Service Security: The Concept of Standard Web Services Security, Standards Framework, An Overview of Current Standards, XML Data Security ,Security Assertions Markup Language (SAML), SOAP Message Security, Key and Trust Management standards, Standards for Policy Specification, Access Control Policy Standards, Implementations of Web Services Security Standards**.** [12]

4. Digital Identity Management and Trust Negotiation: Overview of Digital Identity Management, Overview of Existing Proposals Liberty Alliance, WS-Federation, Comparison of Liberty Alliance and WS-Framework, Other Digital Identity Management Initiatives, Discussion on Security of Identity Management Systems, Business Processes. [10]

5. Access Control for Web Services: Approaches to Enforce Access Control for Web Services, WS-AC: An Adaptive Access Control Model for Stateless, Web Services, The WS-AC Model, WS-AC Identity Attribute Negotiation, WS-AC Parameter Negotiation. [10]

Reference Book:

1. Elisa Bertino, Lorenzo D. Martino, Federica Paci, Anna C. Squicciarini, Security for Web Services and Service Oriented Architectures, Springer Science (2009).

Total Lectures: 52

CS 574 Mobile and Wireless Security 4-0-0-4

1. **Wireless Technologies:** Introduction to Wireless technologies- Wireless data networks-Personal Area Networks -Transmission Media – WLAN standards - Securing WLANS - Countermeasures - WEP (Wired Equivalence Protocol). [10]

2. **Multiple Access Techniques and Wireless Networking**: Introduction- FDMA, TDMA, Spread Spectrum Multiple Access: Space Division Multiple Access- Packet Radio, Introduction To Wireless Networks- Differences Between Wireless And Fixed Telephone Networks, Development Of Wireless Networks, Traffic Routing In Wireless Networks Integrated Services Digital Network (ISDN), Protocols For Network Access. [12]

3. **Wireless Threats**: Kinds of security breaches – Eavesdropping, Communication Jamming, RF interference, Covert wireless channels, DOS attack, Spoofing, Theft of services, Traffic Analysis, Cryptographic threats, Wireless security Standards. [10]

4. **Security in Data Networks**: Wireless Device Security Issues - CDPD security (Cellular Digital Packet Data), GPRS security (General Packet Radio Service), GSM (Global System for Mobile Communication) security, IP security. [10]

5. **Wireless Transport Layer Security**: Secure Socket Layer - Wireless Transport Layer Security - WAP Security Architecture - WAP Gateway. [10]

Reference Books:

1. Nichols and Lekka, “Wireless Security-Models, Threats and Solutions”, Tata McGraw – Hill, New Delhi, 2006.
2. Merritt Maxim and David Pollino,”Wireless Security”, Osborne/McGraw Hill, New Delhi, 2005.
3. William Stallings, “Cryptography and Network Security - Principles and practices, Prentice Hall, New Delhi, 2006.

Total Lectures: 52

CS 576 Information Security Policies 4-0-0-4

1. Cyber Security and its problem-Intervention Strategies: Redundancy, Diversity and Autarchy. Private ordering solutions, Regulation and Jurisdiction for global Cyber security, Copy Right-source of risks, Pirates, Internet Infringement, Fair Use, postings, criminal liability, First Amendments, Data Losing. [13]

2. Copy Right-Source of risks: Pirates, Internet Infringement, air Use, postings, Criminal Liability, First Amendments, Losing Data, Trademarks, Defamation, Privacy-Common Law Privacy, Constitutional law, Federal Statutes, Anonymity, Technology expanding privacy rights. [13]

3. Duty of care &criminal liability: procedural issues, Electronic Contracts & Digital Signatures, Misappropriation of information, Civil Rights, Tax, Evidence. Information security policies and procedures : Corporate policies-Tier 1,Tier 2 and Tier 3 policies, Process management planning and preparation developing policies-asset classification policy developing standards. [13]

4. Information security: fundamentals-Employee responsibilities- information classification-Information handling- Tools of information security- Information processing-secure program Administration. Organizational and Human Security: Adoption of Information Security Management Standards, Human Factors in Security- Role of information security professionals [13]

Reference Books:

1. Jonathan Rosenoer, Cyber Law: The law of the Internet, Springer, 1997
2. Mark F Grady, Fransesco Parisi Thomas R. Peltier, The Law and Economics of Cyber Security, Cambridge University Press, 2005.
3. Kenneth J. Knapp, "Cyber Security and Global Information Assurance: Threat Analysis and Response Solutions", IGI Global, 2009.
4. Thomas R Peltier, Justin Peltier and John blackley,"Information Security Fundamentals", 2nd Edition.

Total Lectures: 52

CS 578 Operating System and Mobile Application Security 4-0-0-4

1. Introduction to android: An open platform for mobile development, android applications, and android SDK features, developing for android, developing for mobile devices, android development tools. Introducing the application manifest, using the manifest editor, the android application lifecycle, externalizing resources, fundamental android UI design, introducing views and layouts, creating new views and menus. [10]

2. Intents, broadcast receiver, adapters and the Internet: Introducing Internet and adapters, using internet resources, introducing dialogs, Data storage, retrieval and sharing techniques for saving data, saving simple application data and loading files, databases in android. [10]

3. Maps, Geocoding and Location based services: setting up the emulator with test providers, Selecting the location provider, finding your location, using proximity alerts, using the geocoder, creating map based activities and mapping earthquakes example Advance Android development paranoid android, using AIDL to support IPC for services, using internet services, building rich user interfaces. [10]

4. Mobile Web Architecture, Standards and Tools: Mobile Internet Access, Mobile Web browser Evolution, Mobile Web Standards and development time, WAP and WAP Standards, XHTML, WML and WML Script, Mobile Web Development Approaches, Content Adaption and Adaption Strategies, How to recognize end user device, Device Detection in PHP, Tools Available for mobile web development, Conversion Engines, Emulators, Mobile Web Checkers, Dynamic content**.** [11]

5. Mobile Application Development Management & Security Mobilized Enterprise Web Architectures, User To Mobile Client Security Issues, Mobile Client Security Issues, Client Server Communications Security Issues, Existing Web Architectures and Back End Systems Security Issues, Project Management, Requirements, Design, Code Development and Integration, Integration and System Testing, Deployment and Release Management, Re Evaluation and Reiteration, Operations and Maintenance. [11]

Reference Books

1. Reto Meier, Professional Android Application Development, John Wiley and Sons, 2010.
2. Rick Rogers, John Lombardo, Zigurd Mednieks, G. Blake Meike, Android Application Development Programming with the Google SDK, O'Reilly, 2009.
3. Valentino Lee; Heather Schneider; Robbie Schell , Mobile Applications Architecture, Design, and Development, Prentice Hall April 16, 2004.

Total Lectures: 52

CS 580 Biometric Security 4-0-0-4

1. Overview: Introduction, benefits of biometrics over traditional authentication systems, benefits of biometrics in identification systems, selecting a biometric for a system, Key biometric terms and processes, biometric matching methods, Accuracy in biometric systems. [11]

2. Physiological Biometric Technologies: Leading technologies: Finger-scan, Facial-scan, Iris-scan, Voice-scan, components, working principles, competing technologies, strengths and weaknesses. Other physiological biometrics: Hand-scan, Retina-scan, components, working principles, competing technologies, strengths and weaknesses, automated fingerprint identification systems. [11]

3. Behavioral Biometric Technologies: Handprint Biometrics, DNA Biometrics, signature and handwriting technology, Technical description, classification, keyboard / keystroke dynamics, Voice, data acquisition, feature extraction, characteristics, strengths, weaknesses, deployment. [10]

4. Multi Biometrics: Multi biometrics and multi factor biometrics - two-factor authentication with passwords - tickets and tokens – executive decision - implementation plan. [10]

5. Biometric Applications: Categorizing biometric applications – application areas: criminal and citizen identification, surveillance, PC/network access, e-commerce and retail/ATM, costs to deploy, other issues in deployment. [10]

Reference Book:

1. Samir Nanavathi, Michel Thieme, and Raj Nanavathi, "Biometrics -Identity verification in a network", Wiley Eastern, 2002.
2. John Chirillo and Scott Blaul," Implementing Biometric Security", Wiley Eastern Publications, 2005.
3. John Berger," Biometrics for Network Security", Prentice Hall, 2004.

Spring Semester	CA 702	Dissertation	-	-	-	20	-	100		

50+50+45 **Total Credits = 145**

#* CA 791 Comprehensive Viva Voce is based on the subjects CA705, CA709, CA711 & Elective III

* **Theory**: Assignments and regularity will be evaluated out of 10(ten) marks in a semester.
Practicals: Practical record and regularity will be evaluated 4 (four) times in a semester. Each evaluation will be out of 10 (ten) marks.

** ***Theory*** : Two mid-term examinations of 20 (twenty) marks each.
Practicals: Viva/quizzes will be held 4 (four) times in a semester, each of 10 (ten) marks.

The **comprehensive viva voce** for all the core courses (as mentioned by #* or #** at the end of each semester) will be conducted by the following members:-

(i) HOD : Chairman
(ii) Internal Examiner : Member
(iii) External Examiner : Member

The distribution of weightage of marks for the viva voce among the Examiners shall be as follows:

(i) Dean Nominee : 25%
(ii) External examiner : 25%
(iii) HOD : 50%

Master of Computer Applications (M.C.A.)
Three-Year Programme
Academic Curriculum (2016 – 17 onwards)

List of Electives		
Elective1		
S. No.	Course Code	Course Title
1.	**CA 630**	Advanced DBMS
2.	**CA 631**	Real Time Systems
3.	**CA 632**	Software Project Management
4.	**CA 633**	M Commerce
Elective2		
1.	CA 642	Digital Image Processing
2.	CA 644	Artificial Intelligence
3.	CA 646	Parallel Processing
4.	CA 648	Service Oriented Architecture
Elective3		
1.	CA 741	Advanced Data Structures
2.	CA 743	Cloud Computing
3.	CA 745	Compiler Design
4.	CA 747	Neural Network
Lab Elective		
1.	CA 727	PHP Laboratory
2.	CA 729	Dot Net laboratory
3.	CA 731	Advanced Java laboratory

N.B. The curricular structure is subject to revision from time to time, which will be duly notified.

CT 509 **Basic Communication Skills** **3-0-0-3**

Total Lectures:40

1. **Spoken English:** Basic sentence types, Tenses (Present, Past, Future), Modals (can, could, shall, should, will, would, may, might, must, ought to, need), Determiners, Question Tags, Phrasal verbs. [8]
2. **Reading and Writing:** Reading Comprehension**:** Efficient reading and note taking, Proof Reading, Précis Writing, Report Writing, Theme (paragraph) Writing, Resume Writing, composing an email. [5]
3. **Advance Communication:** Definition and purpose, Art of Communication, Quizzes, exercise and incidents for practice. [6]
4. **Group Discussion:** Definition, importance, process, points to be borne in mind while participating, Do's and Don'ts in GD, Practice. [6]
5. **Interview skills:** Definition, process, types and preparation (physical, mental), Preparation for FAQ, Dos and Don'ts, Practice. [6]
6. **Communication issues:** Choice of words, sentence formation, essentials of effective communication, barriers to communication. [3]
7. **Different Notions and Concepts:** Request, order, condition, purpose, suggestion, wishes, obligation, possibility, concession. [3]
8. **Phonetics:** Phonology and morphology, body language, pronunciation. [3]

Text Books:

1. Hornby A.S.: "A Guide to Patterns and Usage", Oxford University Press, Delhi,1975.
2. Leech Geoffery: "English Grammar for today", Longman, Delhi,2009.
3. Tonguk R.K, Kumar S.K; "An English Miscellany", Oxford University Press, New Delhi,1999.

Reference Books:

1. Rutherford A. “Basic Communication Skills for Technology”, 2nd Ed, 2002,Pearson Education, New Delhi,2002.
2. Sharma R.C. and Krishna M, “Business Correspondenceand Report Writing” Tata- Mcgraw Hill, 2nd Ed, New Delhi, 1999.
3. Bhatnagar R.P., “English for Competitive Examination”, 5th Ed, Macmillan India Limited,1998
4. Wren and Martin: “English Grammar & Composition”, S.Chand and Co, Delhi,2000.

CA 517 **Business Accounting** **3-0-0-3**

Total Lectures: 40

1. **Fundamentals of Accounting:** Meaning, Scope and objective of accounting, Accounting principles, Accounting concepts and conventions, Double entry system. [5]

2. **Financial Accounting:** Rules for Journalisation, Posting in ledger, Trial balance, Preparation of financial statement: Trading account, Profit and loss account, Balance sheet;Analysis of financial statement. [10]

3. **Management Accounting:** Concept andobjectives of Management Accounting, Ratio Analysis: Objectives, Advantages and limitations,Types of ratios; Funds flow analysis and Cash flow analysis, Capital budgeting. [10]

4. **Cost Accounting:** Concept and principles, Classification and elements of cost, Techniques of Cost Accounting: Marginal costing, Standard costing, Budgetary Control -Types of budgets, Preparation of budgets; Working capital. [12]

5. **Computerized Accounting**: Uses of Microsoft Excel in accounting, analysis of balance sheet with excel Tally software-application. [3]

Text Books:

1. Bhattacharya A. K, Financial accounting, Prentice Hall of India, 3rd edition, 2006.

2. Khan M.Y. and Jain P.K., Management Accounting, Tata McGraw-Hill Education,2006

3.SaxenaV.K. &VashistC.D., Advanced Cost and Management Accounting , Sultan Chand and Sons,2002.

Reference Books:

1. Jain S.P &NarangK. L, Financial Accounting, Kalyani Publications, 2013.

2.Kulkarni.Mahesh, Management Accounting, Career Publications, 2008.

3.PatankarSanjay, Management Accounting, NiraliPrakashan, 2010.

4. MaheshwariS. N., Management Accounting and Financial Control, S. Chand & Company, 1996.

5 Gupta S.P., Management Accounting, SahityaBhawan, 2nd Edition, 2000.

CA 527 C Programming Laboratory 0-0-4-2

1. Introduction

Testing

- Data Types & Operators
- Control Statements
- Arrays
- Strings

Programs

- Apply logic to print different patterns(at least 5)
- Programs like to print Fibonacci series, check whether a number is prime or not
- Max and min of a given list of numbers, their sum and average
- Result of a student using switch-case
- Implementing matrix operations
- Searching and Sorting
- String Manipulations
- Program to understand the decision making constructs and find the roots of a quadratic equation
- Program to understand the implementation of library function

2. Functions

Testing

- Function & Function Calling
- Storage Classes

Programs

- Function Declaration and Definition
- Function call by value and call by reference
- Illustration of storage classes

3. Pointers, Structure and Union

Testing

- Pointer
- Structure
- Union

Programs

- Declaring and initializing pointers
- Accessing a variable through its pointer
- To Implement and use user defined type structures
- Creating a new data type Date with the help of structure
- To understand the use of pointers in arrays
- To learn dynamic memory allocation and deallocation
- To implement list and pointer to list

4. File Handling

Testing

- FILE

Programs

- program to Create a File & Store Information
- program to illustrate Reading of Data from a File and to delete or replace a specific Line from a Text File
- program to Create Employee Record and Update it

CA 509 **C Programming** **3-0-0-3**

Total Lectures:40

1. **Introduction:**Brief History, Library& Linking, Compilation & Execution, Data Types, Operator and Expression Identifier, Keyword and Token, Constant, Data Declaration and Definition, Operators and Expression, Precedence & Associability of Operators. [7]

2. **Control and Loop Statement:** Introduction, Selection Statements, If, The Conditional Expression, switch, Iteration Statements: for loop, while loop, do-while loop, Jump, Goto label, break and continue, exit() function. [7]

3. **Array, Function and String:** Definition, declaration and Types of Array, Operation and application of array, Brief introduction on string header files and applications of strings. Function, argument passing, scope of variable, call by reference and call by value, recursion, passing array to function. [5]

4. **Structure and Union:** Definition, Declaration and Initialization, Accessing Structure members, Arrays of Structure, Passing Structure to function, Structure to Pointer, Union. [6]

5. **Pointers:** Definition, declaration, Pointer to Pointer, NULL Pointer, De-referencing Pointer, Pointer Arithmetic , array to pointer (1-D array ,2-D array), pointer array, function to pointer. [6]

6. **File handling:** Introduction, Defining and Opening a File in read and writes mode, Closing a file and ending of file, Enumerated data types, Error Handling During I/O Operation, Random Access to Files, Command Line Arguments. [5]

7. **Storage Classes & Preprocessor:** Introduction,Storage Classes. Preprocessor Directive, Macro. [4]

Text Books:

1. Scheldt Herbert, "C The Complete Reference" Tata McGraw hill 6th edition,2010.

2. Kernighan & Ritchie, "C Programming Language" Prentice Hall Second Edition, 1988.

Reference Books:

1 Kanetkar Y.P., "Let us C Solutions" 10th edition, BPB publication, 2010.

2. Balaguruswamy E., "Programming in ANSI C "5th Edition Tata McGraw-Hill Education, 2004.

CA 528 **C++ Programming Lab** **0-0-4-2**

1. Introduction to C++

Testing:
• Data Types & Operators
• Control Statements
• Arrays

Programs:

- Apply logic to print different patterns (atleast 3)
- Find average, minimum and maximum of an array elements.
- To print Fibonacci series.
- Multiplication of two matrices
- Application programs based on above elements in different areas of computing like Science, Business, Mathematics and other manual processes.

2. Classes and Object

Testing:
• Class with function printing hello World
• Class with default constructor
• Class with parameterized constructor
• Destructor
• Static and constant data

Programs:

- To demonstrate classes and different types of constructors.
- Application programs based on above elements in different areas of computing like Science, Business, Mathematics and other manual processes.

3. Inheritance and Polymorphism

Testing:
• Inheritance
• Function Overloading
• Operator overloading
• Overriding
• Comparisons between private, public and protected
• Virtual function and [pure]virtual class
• This pointer
• Exception handling
• Abstract class

Programs:

- Show function overloading to calculate the area of different shapes.
- Write a program in c++ which implements the concept of different types of inheritance, virtual base class. Initialize the data using constructor.
- Write a program that handles three exceptions.
- Application programs based on above elements in different areas of computing like Science, Business, Mathematics and other manual processes.

4. I/O handling

Testing:

• Reading and writing from/to a file
• Output formatting

Programs:

- Reads one line at a time from an ASCII file, Stores the individual words in an array and prints the words in reverse order (one word per line)
- Application programs based on above elements in different areas of computing like Science, Business, Mathematics and other manual processes.

5. Templates

Testing:
• Class template
• Function template
• Overloading function template

Programs:

- Programs to demonstrate different templates.
- Application programs based on above elements in different areas of computing like Science, Business, Mathematics and other manual processes.

CA 510 **C++ Programming** **3-0-0-3**

Total Lectures:40

1. **Introduction**: Overview of oops, Differences between OOP and Procedure Oriented programming, Structure of a C/C++ program, Differences between C/C++, Data Types in C++, Identifier and Keywords, Constants,C++ Operators, Type Conversion,Variable declaration, statements, Expressions, Features of iostream.h,Input andOutput, Conditional Expression,Loop statements, Jump statements. [7]

2. **Data Abstraction and Polymorphism:**Class Definition, Controlling access to other functions, Memory Allocation, Different Types of Constructors, Destructor,Dynamic Creation and Destruction of Objects.Overloading functions and operators, Overloading New and Delete operators. [7]

3. **Inheritance:**Definition, DerivedClasses, Syntax of Derived Classes, Base Class, Types of Inheritance, Overloading Inherited Member Functions ,Virtual Base Class. [5]

4. V**irtual functions and polymorphism:** Static and Dynamic bindings,virtual functions, dynamic binding through virtual functions,virtual function call mechanism, implications of polymorphic use of classes , virtual destructors , calling virtual functions in a base class constructor. [6]

5. **I/O and Templates:** Standard I/O Using C functions, stream I/O in C++, formatted I/O, File I/O, generic Classes in C++, Necessity of Templates , generic classes using Macros, class templates, Function Templates, Advantages of Templates. [8]

6. **Exception and File Handling:** Benefits of exception handling, troubles with standard C functions , exception handling mechanism in C++, hierarchy of file stream classes, opening and closing files, file modes, testing for errors,file pointers and their manipulations, ASCII & Binary files, sequential and random access files. [7]

Text Books:

1. Schildt Herbert, C++: The Complete Reference ,4th edition, Tata Mcgraw Hills, 2003.

2. Balagurusamy E., Object Oriented Programming With C++,4thedition, Tata Mcgraw Hills, 2013

Reference Books:

1 Lafore Robert, Object-Oriented Programming in C++, 4th edition, Galgotia publications, 2001.

2. Prata Stephen, C++ Primer Plus, 6th edition , Pearson publication,2011.

CS 218 Computer Organization and Architecture 3-1-0-4

Total Lectures:40

1. **Basic Structure of Computers:** Functional units, basic operational concepts, bus structures, software performance, memory locations and addresses, memory operations, instruction and instruction sequencing, addressing modes, assembly language, basic I/O operations. [8]

2. **Arithmetic Unit:** Addition and subtraction of unsigned and signed numbers, design of fast adders, multiplication of positive numbers, signed operand multiplication and fast multiplication, integer division, floating-point numbers and operations. [8]

3. **Processing Unit:** Fundamental concepts, execution of a complete instruction, multiple bus organization, hardwired control, microprogrammed control, parallel processing, pipelining, basic concepts of hazards, data and instruction hazards, data path and control hazard consideration. [10]

4. **Memory System:** Basic concepts, semiconductor RAMs, ROMs: speed, size and cost, cache memories, performance consideration, virtual memory, memory management requirements, secondary storage. [8]

5. **I/O Organization:** Accessing I/O devices, interrupts, direct memory access, buses, interface circuits, standard I/O interfaces (PCI, SCSI, USB). [6]

Text Books:

1. Hamacher Carl, Vranesic Zvonko and Zaky Safwat, "Computer Organization", , McGraw-Hill, 5th Edition, 2002.
2. Stallings William, "Computer Organization and Architecture-Designing for Performance", Pearson Education, 8th Edition, 2011.

Reference Books:

1. Mano Morris, "Computer System Architecture", Pearson Education, 3rd Edition, 2007.
2. Hayes John P., "Computer Architecture and Organization", McGraw Hill, 3rd Edition, 1998.
3. Patterson David A. and Hennessy John L., "Computer Organization and Design: The hardware / software interface", Morgan Kaufmann, 2nd Edition, 2002.

CA 529 **Data Structures Laboratory** **0-0-4-2**

Arrays Testing:

- Array declaration and initialization
- Addition & multiplication
- Deletion of elements.

Programs:

1. To implement the array concepts for matrix applications.
2. To implement the 1-D, 2-D and 3-D array concepts for data storage and retrieval.
3. Application programs based on above elements in different areas of computing like Science, Business, Mathematics and other manual processes.

Linked List Testing:

- Insertion
- Deletion
- Traversing
- Searching

Programs:

1. To implement various operations over the linked list.
2. To implement variations of linked list e.g. Circular linked list.
3. Application programs based on above elements in different areas of computing like Science, Business, Mathematics and other manual processes.

Stack Testing:

- Array implementation
- Linked list implementation
- Push and Pop

Programs:

1. To implement various operations over the stack.
2. To demonstrate applications of stack e.g. infix to prefix conversion.

Queue Testing:

- Array implementation
- Linked list implementation
- Insertion
- Deletion

Programs:

1. To implement various operations over the queue.
2. To demonstrate variations of queue e.g. dequeue.

Tree Testing:

- Array implementation
- Linked list implementation
- Insertion
- Deletion
- Searching

Programs:

- To demonstrate variations of Tree e.g. binary search tree.
- To implement different operations on Tree(traversal,insertion,deletion).

Graph Testing:

- Array implementation
- Linked list implementation
- Insertion, Deletion and Searching

Programs:

- To implement various traversing of Graph.
- To demonstrate applications of Graph.

Searching Testing:

- Linear Search
- Binary Search

Programs:

- To implement searching algorithms.

Sorting Testing:

- Bubble Sort, Insertion Sort, Selection Sort, Heap Sort and Quick Sort.

Programs:

- To implement above mentioned sorting algorithms.

CA 516 **Data Structures** **3-0-0-3**

Total Lectures:40

1. **Introduction:** Data Structure definition, Requirement of different Data Structures, Abstract Data Type, Analysis of Algorithm. [3]
2. **Linear Data Structure:** One and Two-dimensional Arrays, Array Representation, Selection Sort, Bubble Sort, Quick Sort, Heap Sort and Merge Sort,Sequential Search, Binary Search. **L**inked List and itsrepresentations, Operations on Linked List, Types of Linked List, Stack and its representation, Operations on Stack, Queue and its representation, Operations on Queue, Applications of these data structures. [15]
3. **Tree :** Binary Tree and its travesals (Breadth-First, Depth-First), Expression Trees (Infix, Prefix, Postfix Traversals), Binary Search Trees, Heaps,AVL Tree. [12]
4. **Graph:** Matrix Representation, List representation and applications, Minimum Spanning Tree finding algorithms, Shortest Path finding algorithms. [5]
5. **Hashing Techniques:** Hash Function, Address Calculation Techniques, Common Hashing Functions, Collision Resolution, Linear Probing, Double Hashing, Bucket Hashing, Deletion and Rehashing. [5]

Text Books:

1. Horowitz and Sahani, “Fundamental of data structures”,Galgotia Publication,1998.
2. Lipschutz, “Data Structures Schaum’s Outline Series”, Tata Mcgraw Hills,2006.

Reference Books:

1 TenenbaumAaron M., YedidyahLangsam and Moshe J. Augenstein “Data Structures Using C and C++” , PHI,2009.
2. Kruse R. etal, “Data Structures and Program Design in C”, Pearson Education,2007.

CA 525 **Digital Electronics Laboratory** **0-0-4-2**

1 To study the use of General Purpose Digital Trainer and familiarization with the digital IC Data-Books.

2 To study AND, OR. NOT, NAND, NOR, EX-OR gates and their specified experiments.

3 To set up a 4-bit Binary Counter (74LS93) to demonstrate its sequence of Counting.

4 To study the characteristics curve of TTL and CMOS logic gates.

5 To design and test 4-bit Adder and Subtractor circuits.

6 To compare the magnitude of two 4-bit Binary Numbers A and B.

7 Design a combinational circuit with 4 inputs and 4-outputs that converts a 4-bit Gray Code to an equivalent 4-bit Binary number.

8 Design and implement a BCD to Seven Segment Decoder / Driver.

9 To design and implement a 2 to 1 multiplexer.

10 To design and implement a 1:2 & 1:4 de multiplexer.

11 To investigate the operation of various flip flops SR, JK, T and D using gates and FF ICs.

12 To study the following application of shift register using IC 74LS164 and 74LS194 (Shift Right Logic, Shift Left Logic, Parallel Load).

13 Design and test arithmetic and logic circuit using combinational circuit (logic circuit, multiplexer and 4-bit binary adder/ full adder. (Already covered in experiment no.6, 10 &11)

14 Design and test a 4-bit Up Down binary counter. (Already covered in experiment no.3)

NOTE: All experiments are to be performed on either physical apparatuses or on digital electronics simulator like Virtual Bread Board etc.

CA 511 **Digital Electronics** **3-1-0-4**

Total Lectures: 40

1 **Number Systems and Codes:** Introduction to number systems, weighted and non-weighted codes, 1's complement, 2's complement, complement arithmetic. [2]

2 **Introduction to Boolean Algebra:** Postulates and theorems of Boolean algebra, Boolean functions, canonical and standard form, simplification of Boolean function using Boolean laws and theorems. [2]

3 **Logic Gates:** Diode and transistor as a switch, basic logic gates, derived logic gates, block diagrams and truth tables, logic diagrams from Boolean expression and vice versa, converting logic diagram to universal logic, positive logic, negative logic and mixed logic. [5]

4 **Simplification of Boolean Functions:** K-map representation, incompletely specified functions, simplification realization with gates, Quine-McCluskey method. [5]

5 **Combinational Logic:** Analysis and design of combinational circuits, half adder and full adder, half subtractor and full subtractor, binary serial and parallel adder, BCD adder, binary multipliers, magnitude comparator, decoders, encoders, multiplexers, de-multiplexers. [10]

6 **Sequential Circuits:** Latches, flip-flops, triggering of the flip-flops, master-slave flip-flop, excitation tables, conversion of the flip-flops, analysis and design of clocked sequential circuits, shift registers, counters. [10]

7 **Logic Families:** Logic gate characteristics (propagation delay, speed, noise margin, fan-in, fan-out, power dissipation), standard logic families (RTL, DCTL, TTL, ECL, MOS) [5]

8 **Programmable Logic:** Introduction to programmable logic array (PLA), programmable array logic (PAL). [1]

Text Books:

1. Mano, M. M. and Ciletti, M.D., "Digital Design", Pearson Education, Delhi, 4thEdition, 2009.
2. Floyd, T. L. and Jain, R.P., "Digital Fundamental", Pearson Education, Delhi, 8thEdition, 2009.
3. Tocci, R. J., Widmer, N. and Moss, G., "Digital System: Principles and Applications", Pearson Education, Delhi, 10thEdition, 2007.

Reference Books:

1. Puri, V. K., "Digital Electronics: Circuits and Systems", Tata McGraw-Hill, Patel Nagar, New Delhi, 4thEdition, 2001.
2. Karim, M.A. and Chen. X., "Digital Design: Basic Concepts and Principles", CRC Press Taylor & Francis Group, Printed in India by Saurabh Printers, 2$_{nd}$ Indian reprint, 2010.
3. Jain, R. P., "Modern Digital Electronics", Tata McGraw-Hill, Patel Nagar, New Delhi, 4thedition,1999.

CA 518 Discrete Mathematics and Probability Theory **3-1-0-4**

Total Lectures = 40

1. **Set Theory:** Sets, Venn-diagrams, algebra of sets, finger sets, binary relations and equivalence relations [6]

2. **Probability Theory:**Fundamentals:Addition and multiplication of probability, Bayes theorem, Binomial, Poisson and normal distribution. [9]

4. **Graph Theory**: Introduction, graph, undirected graph, simple, multiple graph and pseudo graph, walk, path, cycle and connectivity, sub-graph, types of graph, isomorphic graph and representation of graph in computer memory. [10]

5. **Mathematical Logic:**Prepositional calculus, basic logical operations, statements generated by set conditional statements, converse inverse and contraposition statements. [8]

6. **Boolean Algebra:** Basic theorems on Boolean algebra, duality principle, Boolean functions and Boolean expressions. [7]

Text Books:

1. Rosen Kenneth H, "Discrete Mathematics & its applications with Combinatorics and Graph Theory", TMH,2012.

2. Palaniammal S., "Probability & Random Processes", PHI Learning Pvt. Ltd,2000.

3. DeoNarsingh, "Graph Theory with Applications to Engineering and Computer Science", PHI, 1979.

Reference Books:

1. Hines William W., Montgomery D. C. and Goldman David M., "Probability and Statistics in Engineering", Wiley, 2003.

2. Chart rand G. and Zhang P., "Introduction to Graph Theory", TMH, 2006.

3. Kolman B., Busby R. C. and Rass S., "Discrete Mathematical Structures", Prentice – Hall of India Pvt. Ltd, 2013.

CA 507 **Information Systems** **3-0-0-3**

Total Lectures: 40

1. **Information:**Concepts, Information: a quality product, Classification of information, Methods of data and Information collection, Value of information, General model of a human as a information processor, Summary of information concepts and their implications, organization and information, MIS and Information concepts. [8]

2. **Information Systems, Organizations, management and Strategy:** Organisations and Information Systems, how information system impact organizations and business firms, Type of Information System, Managerial Challenges of Information Technology. Components of information System, Information System Activities. [8]

3. **Information Systems for Functional Areas:** Information for financial, Marketing, Inventory control, Production function, Personnel function, Cases related to information, requirement for above functional areas. [8]
4. **Computer Concepts & Peripherals:** Need of computer Literacy, Use and Definition of Computer, Generation of Computer, Classification of Computer, Peripherals: Input, output and storage technologies. [7]

5. **Computer System & System Software:** Brief history of Computer Hardware, Type of Computer System, Microcomputer System, Mainframe Computer System, System Software: Definition, operating system, programming language, web languages and services, Programming software. [9]

Text Book:

1. Steven Alter "Information Systems the foundation of E-Business", 4th Edition Person education, 2010.
2. Brien James A. O'and MarakasGeorge M., "Management Information System" 9th Edition, Tata McGraw Hill Education Private Limited, 2010.

Reference Book:

1. RajaramanV. "Analysis and Design of Information System", Prentice-Hall of India, 3rd Edition, 1996.
2. BasandraSuresh K. "Management Information System", Wheeler Publication, 2003.

CA 515 Mathematical Foundation of Computers **3-1-0-4**

Total Lectures:40

1. **Matrix Theory :** Introduction to the matrix theory, types of matrices, inverse of matrices, rank of matrices, solving system of linear equations, Eigen values and Eigen vectors, Sparse matrix, diagonalization and triangulization of matrices. [16]

2. **Three -dimensional geometry and Vector calculus:** Basic concepts of three-dimensional geometry (viz. direction cosines and direction ratios), equation of a plane and of a straight line. Basic concepts of vectors, gradient, divergence and curl of a vector. [8]

3. **Calculus:** Introduction of differential and integral calculus, derivatives of various types of functions, basic idea of differential equations, solutions of ordinary differential equations with constant coefficients. [10]

4. **Complex Algebra:** Introduction to the complex algebra, complex numbers, geometrical representation of complex numbers: Argand diagram, De-Moirvre's theorem. [6]

Text Books:

1. Ramana B. V. , " Higher Engineering Mathematics", Tata McGraw – Hill Publishing Company Ltd., P 1390, 2nd edition, 2001

2. Babu Ram, "Engineering Mathematics", Pearson, New Delhi, 2010.

3. Narayan Shanti , "Analytical Solid Geometry", S Chand & Company, New Delhi,1988.

Reference Books:

1. Grewal B. S. and Grewal J. S. , "Higher Engineering Mathematics" , Khanna Publishers, New Delhi, P. 1390, 40th edition,2004

2. Kreyszig Errwin, "Engineering Mathematics", John Wiley& Sons, New York, , p. 1639, 9th Edition,1998.

CA 514 **Operating system** **3-0-0-3**

Total Lectures:40

1. **Introduction:** Overview**,** Evolution,Types, operating system functions and characteristics. [3]

2. **Process Management:** The process concept, operating system services for process management, scheduling algorithms and multiple processor scheduling. [5]

3. **Memory Management:** Storage allocation methods, paging, segmentation, virtual memory concept, demand paging, page replacement algorithms and trashing. [5]

4. **Input /Output and File Systems:** Hardware organization, device scheduling policies, Functions of file systems, file access and allocationmethods, directory systems, structured organizations, directory and file protection mechanisms and implementation issues. device dependent and device independent software. [7]

5. **Deadlocks:** Characterization, prevention and avoidance, deadlock detection and recovery and practical consideration. [5]

6. **Process Synchronization:** Critical section problem, semaphores, classical process co-ordination problems and their solutions, inter process communication and message-passing mechanisms. client-server modeling, RPC, threads. [6]

7. **Protection & Security:** Goals of Protection, Principles of Protection. Domain of protection Access Matrix, Implementation of Access Matrix. Access control, Revocation of Access Rights. Capability- Based systems, Language - Based Protection, Security problem, program threats, system and network threats cryptography as a security tool, user authentication, implementing security defenses, fire walling to protect systems [9]

Text Books:

1. Silberschatz A., and Galvin P.B., Operating System Concepts, John Wiley &Sons, 6th Edition, 2005.
2. Tanenbaum A.S., Modern Operating Systems, Pearson Education Asia, 4th Edition, 200

Reference Books:

1 Stallings W., Operating Systems, Pearson Education Asia, 5thEdition, 2008.
2 Tanenbaum A.S. and Woodhull A. S., Operating Systems- Design and Implementation, Pearson Education Asia, 2nd Edition, 2009.

CA 512 Systems Analysis and Design 3-0-0-3

Total Lectures= 40

1. **System Concepts:** Definition, characteristics and elements, Types of system, problems in system development, principles of system building, system engineering [5]

2. **Information Systems**: Information, components and types of information system, computer based information systems. [4]

3. **System Models**: System Development Life Cycle (SDLC), Prototype, Prototype tools and strategy. [5]

4. **Systems Analysis** : Role of systems Analyst, system planning , information gathering tools for determining information requirements, cost/benefit analysis. [6]

5. **Feasibility Study** : System performance constraints, specific system objectives, steps in feasibility analysis, feasibility report. [3]

6. **Structured Analysis** : Definition, Tools of Structured Analysis: data flow diagram, decision tree and decision table. [5]

7. **System Design**: Process and stages in design, input/output and form design, control design, design of database interactions. [6]

8. **System implementation**: System testing and quality assurance, implementation and system maintenance, hardware and software selection, system security and recovery. [6]

Text Books:

1. Awad, Elis M. , " Systems Analysis and Design", Galgotia Publications Pvt. Lid, New Delhi, 1997.
2. Senn, James A., "Analysis & Design of Information ", McGraw Hill Education (india) Pvt. Ltd., New Delhi, 2005.

Reference Books:

1. Goyal, Arunesh , " Systems Analysis and Design", PHI Learning Pvt. Ltd., New Delhi, 2011.
2. Hoffer, J. A., George, J. F. and Valacich, J. S., " Modern Systems Analysis & Design", Pearson Education(Singapore) Pvt. Ltd., Delhi,2005.

CA 508 **Theory of Computation** **3-1-0-4**

Total Lectures:40

1. **Finite Automata and Regular Expression:** Finite State Systems, Basic definitions, Regular Languages and Regular Expressions, Finite Automata, Kleen theorem, Arden's theorem, Mealy and Moore Machine and their Conversion, Pumping Lemma for Regular Sets, Decision Algorithms, Myhill-Nerode theorem and Minimization of finite automata. [12]

2. **Context-Free Grammars:** Context-Free Grammars, Union, Concatenation of CFGs, Derivation Trees, Simplification of Context-Free Grammars, Chomsky Normal Form, Greibach Normal Form, Ambiguous Grammar, Inherently Ambiguous Context-Free Languages. [9]

3. **Context-Free Languages and Pushdown Automata:** Pushdown Automata and Context Free Languages, Pumping Lemma for CFL, Closure Properties of CFL and Decision Algorithms for CFL. [6]

4. **Turing Machine:** Turing Machine Model, Techniques for Turing Machine Construction, Turing Machines as Language Acceptor, Combining Turing Machines, Properties of Recursive And Recursively Enumerable Languages and Universal Turing Machine. [8]

5. **Chomsky Hierarchy of Languages:** Regular Grammars, Unrestricted Grammars and Turing Machines, Context-Sensitive Grammars and Linear Bounded Automata. [5]

Text Books:

1. Martin John C. "Introduction to languages and the theory of computation", 4th edition, McGraw-Hill, 2003
2 Peter linz , "An introduction to Formal Languages and Automata" , Narosa Publishing House, sixth edition, 2010.

Reference Books:

2. Sipser Michael, "Introduction to Theory of Computation", 1st edition, Cengage Learning, 2012.

CA 623 Computer Communication Networks Laboratory 0-0-4-2

Assignments are based on the course contents of CA 605 Computer Communication Networks.

CA 605 Computer Communication Networks 3-1-0-4

Total Lectures: 40

1. **Introduction:** Layered architecture, OSI, TCP/IP. [5]
2. **Physical Layer:** Transmission media, physical layer protocol, switching techniques. [6]
3. **Data Link Layer:** Design issues- framing, error control and flow chart, stop and wait protocol, sliding window protocol, and performance analysis. [7]
4. **Medium Access Sub Layer:** P-ALOHA, S-ALOHA, CSMA, reservation scheme, CSMA/CD, Ethernet, Token Ring, Token Bus, DQDB, FDDI. [6]
5. **Network Layer:** Rotating algorithms, congestion control, internetworking, IP Layer, X.25, ISDN, etc. [6]
6. **Transport Layer:** Quality of service, connection management, flow control and buffering, multiplexing, crash recovery, ICP. [5]
7. **Application Layer:** Network security, electronic mail, SNMP, DNS, etc. [5]

Text Books:

1. Tanenbaum A. S., "Computer Networks", Prentice-Hall of India, 4th ed.,2003.
2. Stallings W., "Data and Computer Communications", Prentice-Hall of India, 6th ed.,2003

References Books:

1. Forouzan B. A., "Data Communications and Networking", Tata McGraw-Hill, 3rd ed.,2006,
2. Hayes J. F., "Modeling and Analysis of Computer Communication Networks", Khanna Publishers.,2003

CA 629 Computer Organization and Architecture 3-0-0-3

Total Lectures: 40

1. **Principles of Computer Organisation:** Software hardware interaction layers in computer architecture, central processing unit, machine language instructions, addressing modes, instruction types, instruction set selection, instruction cycle and execution cycle. [10]

2. **Processor and ALU Design:** Number system, computer arithmetic and ALU design, control unit, data path and control path design, microprogramming versus hardware control, RISC Vs CISC, pipelining in CPU design, superscalar processors. [10]

3. **Memory Organisation:** Memory subsystem, storage technologies, memory array organization, memory hierarchy interleaving, cache and virtual memories and architectural aids to implement these. [10]

4. **Input-Output Organisation:** Input-output devices and characteristics, input-output programming, bus interface, data transfer techniques, I/O interrupts, and channels. [10]

Text Books:

1. Mano M. M., "Computer System Architecture", Prentice-Hall of India, 3rd ed.1992.
2. Hayes J. P., "Computer Architecture and Organization", McGraw- Hill, New York, 3rd ed.,1988.

Reference Books:

1. Hwang K., "Advanced Computer Architecture: Parallelism, Scalability and Programmability", McGraw-Hill, New York.,1993.
2. Carter N., "Computer Architecture", Tata McGraw-Hill,2002.

CA 606 **Cryptography and Network Security** **3-1-0-4**

Total Lectures:40

1. **Introduction**: Attacks, Services and Mechanisms, Security Attacks, Security Services, Integrity check, digital Signature, authentication. [3]

2. **Secret Key Cryptography:** Block Encryption, DES rounds, S-Boxes IDEA: Overview, comparison with DES, Key expansion, IDEA rounds, Uses of Secret key Cryptography; ECB, CBC, OFB, CFB, Multiple encryptions DES. [6]

3. **Hash Functions And Message Digests:** Length of hash, uses, algorithms (MD2, MD4, MD5, SHS) MD2: Algorithm (Padding, checksum, passes.) MD4 and 5: algorithm (padding, stages, digest computation.) SHS: Overview, padding, stages. [7]

4. **Public Key Cryptography:** Algorithms, examples, Modular arithmetic (addition, multiplication, inverse, and exponentiation) RSA: generating keys, encryption and decryption. Other Algorithms: PKCS, Diffie-Hellman, El-Gamal signatures, DSS, Zero-knowledge signatures. [9]

5. **Authentication:** Password Based, Address Based, Cryptographic Authentication. Passwords in distributed systems, on-line vs offline guessing, storing. Cryptographic Authentication: passwords as keys, protocols, KDC's Certification Revocation, Interdomain, groups, delegation. Authentication of People: Verification techniques, passwords, length of passwords, password distribution, smart cards, biometrics. [8]

6**. Network Security:** Electronic mail security, IP security, Network management security. SSL, SET Intruders and Viruses, Firewalls, Intrusion Detection. [7]

Text Books:

1. Kaufman, c., Perlman, R., and Speciner, M., "Network Security, Private Communication in a public world", 2nd ed., Prentice Hall PTR,2002.

2. Stallings, W., "Cryptography and Network Security: Principles and Practice", 3rd ed., Prentice Hall PTR,1994.

Reference Books:

1. Stallings, W. "Network security Essentials: Applications and standards", Prentice Hall,2006.

2. Behrouz A Forouzan. "Cryptography and Network Security"; McGraw Hill.,2007.

3. “Information Security Intelligence Cryptographic Principles and App”. Calabrese Thomson,2006.

4. Kahate Atul, “Cryptography and Network Security”, McGraw Hill,2008.

CA 621 Database Management Systems Laboratory 0-0-4-2

1. **Creating Tables in SQL**

   Testing
   - Create command
   - Update commands
   - Insertion of records
   - Deletion of records
   - Primary Key
   - Foreign Key

   Programs
   - A Database Schema should be created with at least five relations.

2. **Populating records in relations**

   Testing
   - Entity integrity constraint
   - Referential Integrity constraint
   - Domain constraint

   Program
   - Populate the records with the above mentioned constraints for the 5 relations in the schema designed in 1.

3. **Views**

   Testing
   - Creation
   - Deletion
   - Modification

   Program
   - Create 5 meaningful views for the designed database.

4. **PL/SQL**

   Testing
   - Structures
   - Control Statements
   - Variables
   - cursors

Program

- 5 PL/SQL programs to be written for various update process in the designed databases.

5. **Triggers**

Testing

- Creation
- Modification
- Deletion

Program

- 2 Meaningful triggers should be created for updation process in the database.

6. **Reports**

Testing

- Creation
- Modification
- Deletion

Program

- 5 meaningful reports should be designed and implemented.

CA 607 **Database Management Systems** **3-0-0-3**

Total Lectures:40

1. **Introduction:** Databases and database users, database system concepts and architecture, data modeling using the Entity-Relationship (ER) model, Enhanced Entity Relationship model. [7]

2. **Relational Data Model:** Concepts, relational model constraints, relational database schemas, update operations, dealing with constraint violations, relational algebra operations, relational calculus, mapping ER model to relational model. [7]

3. **Structured Query Language (SQL):** SQL data definition and data types, specifying constraints, schema change statements, basic queries, complex queries, update statements, views. [4]

4. **Database Design:** Functional dependencies and normalization of relational databases, First Normal Form (1NF), 2NF, 3NF, Boyce-Codd normal form (BCNF), multivalued dependency, 4NF. [8]

5. **Transaction Processing:** Introduction, properties, recoverability, serializability. Concurrency control techniques: Two phase locking protocol, Database recovery techniques: Recovery concepts, recovery techniques based on deferred and immediate update. [7]

6. **Object and Object-Relational Databases:** Concepts for object databases, object database standards and design, object relational systems. [7]

Text books:

1. Ramez Elmasri & Shamkant B. Navathe, Fundamentals of Database Management Systems, 5th Edition, Pearson Education,2008.
2. Raghu Ramakrishnan, Database Management Systems, 3rd Edition, TMH,2002.

Referenc books:

1. G.W. Hansen, and J.V. Hansen, Database Management and Design, 2nd Edition, PHI,1999.
2. Korth and Schilberschatz, Database System Concepts, 4th Edition, TMH,2006.
3. C.J. Date, Database Systems, 2nd Edition, TMH,2003.

CA 603 **Design and Analysis of Algorithms** **3-1-0-4**

Total Lectures:40

1. **Analysis of Algorithms:** Asymptotic notation, proof by induction, solving recurrences, the Master Theorem, analysis of algorithms for time and space complexity, worst case, average case and amortized case analysis. [10]
2. **Algorithm Methodologies:** Recursion, divide and conquer algorithms, greedy algorithms, dynamic programming, backtracking and branch-and-bound with examples, applications and analysis. [12]
3. **Graph Algorithms:** Basic graph search methods (BFS, DFS), spanning trees, Prim, Kruskal algorithms, path finding and shortest path algorithms, topological sorting, bipartite graphs. [10]
4. **Infeasibility:** P and NP classes, NP hard problems, parallel algorithms-principles, models and analysis and applications**.** [8]

Text Books:

1. Cormen T. H., Leiserson C. E., Rivest R. L., and Stein C., "Introduction to Algorithms", Prentice-Hall of India, 2nd ed,2002.
2. Horowitz E., "Computer Algorithms", Galgotia Publications,2008.

Reference Book:

1. Aho A.V., Design and Analysis of Computer Algorithms, Pearson Education Asia, 2000.
2. Brassard G., "Fundamentals of Algorithmics", Prentice-Hall of India,2003.

CA 625 Java Programming Laboratory 0-0-4-2

1. Introduction

Testing

- Data Types and Operators
- Control Statements
- Arrays

Programs

- Apply logic to print different patterns(at least 3)
- Programs like to print Fibonacci series, check whether a number is prime or not
- Max and min of a given list of numbers, their sum and average
- Result of a student using switch-case
- 3 application programs based on above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.

2. Classes, Object and Inheritance

Testing

- Objects and reference variables
- Constructors and parameterized constructors
- this, static, command line arguments
- Inheritance, overloading and overriding
- super, abstract classes and Dynamic method dispatch

Programs

- Write a program to illustrate super .
- Show method overloading to calculate the area of different shapes.
- Manipulate the above program to illustrate run time polymorphism.
- application programs based on above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.

3. Package, Interfaces and Exception Handling

Testing

- importing packages
- interfaces and multiple inheritance
- exception-handling fundamentals
- built-in exceptions and creating one's own exception subclasses

Programs

- Write and execute a program which is inside a package "MyPacK".
- Write a program which imports a package.

- Write a program in which implements the concept of multiple inheritance.
- Write a program that handles two Exceptions, each at different run.
- Write a program in which an user defined exception is created.

4. Multithreading

Testing

- The Java thread model, creating a thread and multiple threads
- Synchronisation and interthread communication

Programs

- Write a program to create a thread using Runnable interface
- Write a program to create a thread by extending Thread class
- Write a program to create multiple threads
- Illustrate isAlive, join, suspend, resume and stop
-

5. I/O, Applets and String Handling

Testing :

- Reading console input and writing console output
- BufferedReader class and PrintWriter class
- String operations and comparisons

Program:

- Write a program to print the last characters of all the strings given from command line
- Change the case of characters within a string.
- Write an applet to print “HELLO”**.**
- Any 3 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.

CA 609 **Java Programming** **3-0-0-3**

Total Lectures: 40

1. **The Genesis of Java:** The importance of Java to Internet, Java's magic-the byte code, the Java buzzwords, the continuing revolution, Java and HTML, using blocks of code, lexical issues, the Java class libraries. [4]

2. **Data Types, Variable, and Arrays:** Java as a strongly typed language, the simple types, integers, floating-point types, characters, Booleans, a closer look at literals, variables, type conversion and casting, automatic type promotion in expressions, arrays, a few works about string, a note to C/C++ programmers about pointers, operators-arithmetic operators, the bitwise operators, relational operators, Boolean logical operators, the assignment operator, the ? operator, operator precedence, using parentheses, control statements-Java selection statements, iteration statements, jump statements. [8]

3. **Classes:** Class fundamentals, declaring objects, assigning object reference variables, introducing methods, constructors, the this keyword, garbage collection, the finalize () method, a stack class, overloading methods, using objects as parameters, a closer look at argument passing, returning objects, recursion, introducing access control, understanding static, introducing final, arrays revisited, introducing nested and inner classes, exploring the string class, using command-line arguments. [9]

4. **Inheritance:** Inheritance basics, using super, creating a multilevel hierarchy, when constructors are called, method overriding, dynamic method dispatch, using abstract classes, using final with inheritance, the object class, Multithreading. [6]

5. **Package, Interfaces and Exception Handling:** Packages, access protection, importing packages, interfaces, exception-handling fundamentals, exception types, uncaught exceptions, using try and catch, multiple catch clauses, nested try statements, throw, throws, finally, Java's built-in exceptions, creating your own exception subclasses, using exceptions. [7]

7. **I/O, Applets, and String Handling:** I/O basics, reading console input, writing console output, the Print Writer class, reading and writing files, applet fundamentals, the transient and volatile modifiers, string constructors, string length, special string operations, character extraction, operations on string. [6]

Text Books :

1. Schildt Herbert "Java: The Complete Reference" McGraw Hill Education; 9 edition,2014.

Reference Books:

1. Budo Timothy "Understanding Object-Oriented Programming with JAVA" . Pearson,1999.
2. Balagurusamy E " Programming with JAVA, A Primer" Tata Mcgraw Hill,2006.

CA 608 Management Information Systems 3-0-0-3

Total Lectures:40

1. **Organization:** Hierarchy in the organization structure, information flows, concentration of authority, characteristics of managers, problem solving by managers. [5]
2. **Information Needs and Sources of Managers:** Activities of the organization, managerial activities, planning, types of management decisions and information needs, types of information needed, sources of information. [5]
3. **Basics of Management Information Systems**: Overview of information system, MIS concepts, definition, role and impact of MIS, process of management, organization structure and behaviors, decision making, information concepts, levels of information systems, system concepts, types of system, system development model. [10]
4. **Development of Management Information Systems:** Information requirements determination tools, development and implementation of MIS, choice of information technology. [6]
5. **Application of Management Information Systems:** Applications in manufacturing sector-personnel management, financial management, production management, material management, marketing management, applications in service sector, Decision support system. [8]
6. **Special Topics:** Technology of information system, business process reengineering, electronic business technology. [6]

Text Books:

1. Jawadekar W. S., Management Information Systems, McGraw-Hill, New York, 2nd ed,2002.
2. Basandra, S. K., Management Information Systems, Wheeler Publishing, New Delhi,1997.

Reference Books:

1. O' Brien, J. A., Management Information Systems, Galgotia Publications,2003.
2. Post, G. V., and Anderson D. L., Management Information Systems, Tata McGraw – Hill,2006.
3. Davis G. B., and Olson M. H., Management Information Systems, Tata McGraw-Hill,1985.

CA 628 Mobile Application Development Laboratory 0-0-4-2

1. What is Android? o Setting up development environment o Dalvik Virtual Machine & .apk file extension o Fundamentals: a. Basic Building blocks - Activities,Services,Broadcast Receivers & Content providers b. UI Components - Views & notifications c. Components for communication -Intents & Intent Filters o Android API levels (versions & version names)
2. Emulator-Android Virtual Device o Launching emulator o Editing emulator settings o Emulator shortcuts o Logcat usage o Introduction to DDMS o Second App:- (switching between activities) Develop an app for demonstrating the communication between Intents
3. Basic UI design o Form widgets o Text Fields o Layouts o [dip, dp, sip, sp] versus px, Menu o Option menu o Context menu o Sub menu o menu from xml o menu via code
4. : Intents (in detail) o Explicit Intents o Implicit intents o Examples
5. Styles & Themes o styles.xml o drawable resources for shapes, gradients (selectors) o style attribute in layout file o Applying themes via code and manifest file
6. SQLite Programming o SQLiteOpenHelper o SQLiteDatabse o Cursor o Reading and updating Contacts o Reading bookmarks o
7. Notifications o Broadcast Receivers o Services and notifications o Toast o Alarms

CA 610 **Mobile Computing** **3-0-0-3**

Total Lectures:40

1**. Introduction,**issues in mobile computing, overview of wireless telephony: cellular concept, GSM: air-interface, channel structure, location management: HLR-VLR, hierarchical, handoffs, channel allocation in cellular systems, CDMA, GPRS. [8]

2. **Wireless Networking,**Wireless LAN Overview: MAC issues, IEEE 802.11, Blue Tooth, Wireless multiple access protocols, TCP over wireless, Wireless applications, data broadcasting, Mobile IP, WAP: Architecture, protocol stack, application environment, applications. [8]

3. **Data Management Issues**, data replication for mobile computers, adaptive clustering for mobile wireless networks, File system, Disconnected operations. [8]

4. **Mobile Agents computing**, security and fault tolerance, transaction processing in mobile computing environment. [8]

5**. Ad Hoc Networks**, localization, MAC issues, Routing protocols, global state routing (GSR), Destination sequenced distance vector routing (DSDV), Dynamic source routing (DSR), Ad Hoc on demand distance vector routing (AODV), Temporary ordered routing algorithm (TORA), QoS in Ad Hoc Networks, applications. [8]

Text Books:

1. Schiller J., "Mobile Communications", Addison Wesley,2003.

2. Mehrotra A. , "GSM System Engineering",1997.

3. Heijden M. V. D., M. Taylor, "Understanding WAP", Artech House,2000.

Reference Books:

1. Perkins Charles, "Mobile IP", Addison Wesley,1994.

2. Perkins Charles, "Ad hoc Networks", Addison Wesley,2001.

CA 626 Software Engineering Lab 0-0-4-2

1. Design a software process model for a project based on SRS.

   Testing
   - Waterfall model
   - Prototyping model
   - Iterative model
   - Spiral model etc.

   Design SRS for 5 different projects and use CASE tool to select the model.

2. Software project estimation.

   Testing
   - Effort estimation
   - Development time estimation
   - Schedule estimation
   - Cost estimation

   Design 5 different projects and use CASE tool to estimate the effort, schedule, and cost required to develop a software product.

3. Develop data flow diagrams.

   Testing
   - Context diagrams
   - Level 1/2/3 diagrams
   - Balancing DFDs
   - Synchronous/asynchronous operations

   Draw DFDs for 5 different projects using CASE tool.

4. Develop software code as per coding standards.

   Testing
   - Reading Data
   - Data processing
   - Data storage
   - Data display

   Write code for a complete project that has these features.

5. Black box and white box testing.

Testing

- Equivalence class partitioning
- Boundary value analysis
- Statement coverage
- Branch coverage
- Condition coverage
- Path coverage using McCabe's cyclomatic complexity metric.

Write test cases for 5 different program modules. Test for errors and debug.

CA 634 **Software Engineering** **3-0-0-3**

Total Lectures:40

1. **Introduction To Software Engineering:** Software crisis, Software engineering Approach and Challenges, Software development process models with comparison: Waterfall, Rapid prototyping, Timeboxing and Spiral Models, and Automation through software environments. [8]
2. **Planning The Software Project:** Cost Estimation, Planning Schedule, Staffing, Project Monitoring, Quality Assurance and Risk Management. [8]
3. **Structured Analysis:** Initial Investigation, Feasibility study, Traditional and modern methods of requirement determination, SRS, Structuring the requirements: Process modeling, logic modeling, conceptual data modeling, Metrics. Validation VS verification [8]
4. **Design Fundamentals:** Function and Object Oriented Design concepts, Verification and Metrics. Coding and Maintenance: Coding Process, Metrics, Testing fundamentals, Types of Testing, Metrics, Types of Maintenance. [8]
5. **Software Re-Engineering:** Source Code Translation, Program Restructuring, Data Re-Engineering, Reverse Engineering. [8]

Text Books:

1. Sommerville Ian, "Software Engineering", Addison Wesley, 6th ed,1995.
2. Hoffer, George, Valacich, "Modern System Analysis and Design" Pearson Education, 3rd ed,2012.

Reference Books:

1. Pressman S. Roger, "Software Engineering", Tata McGraw-Hill,2009.
2. JalotePankaj, "An integrated Approach to Software", Engineering, Narosa Publishing House,2014.

CA 725 COMPUTER GRAPHICS LABORATORY 0-0-4-2

1. **Introduction to computer graphics & graphics systems**

   Testing
   - Demonstration of graphics display devices, IO devices.
   - Initialization of graphic in 'C'.
   - Use of graphics primitives – line, circle, rectangle, arc, etc.

   Programs
   - Graphics programs are to be written for the above graphics primitives with color and moving effect (E.g. bus, hut, fish, kite etc).

2. **Scan conversion**

   Testing
   - Line drawing algorithms (DDA, Bresenham, mid-point).
   - Circle generation algorithm (Bresenham, mid-point)
   - Ellipse generation algorithm
   - Filling algorithm (boundary fill, flood fill, scan line polygon fill)

   Program
   - Graphics programs are to be written for each of the above algorithms.

3. **2D & 3D transformation**

   Testing
   - Translation
   - Rotation
   - Scaling
   - Reflection
   - Shearing

   Program
   - Graphics programs are to be written for each of the above algorithms for different axis.

4. **2D viewing & clipping**

   Testing
   - Line clipping algorithm (Cohen Sutherland, Liang Barsky)
   - Polygon clipping (Sutherland Hodgeman, Weiler and Atherton)

   Program
   - Graphics programs are to be written for each of the above algorithms.

5. **Curves**

Testing

- Bspline curves
- Bezier curves

Program

- Graphics programs are to be written for the above Curves.

CA 715 **Computer Graphics** **3-1-0-4**

Total Lecture:40

1. **Overview:** Display devices – Video, refresh CRT, raster scan, random scan, color CRT, monitors raster scan systems, video controller, raster scan display processor, input devices – trackball and space ball, joy-sticks, digitizers, scanners, touch panels, light pen. [4]
2. **Scan Conversion:** Primitive drawing – DDA and Bresenham algorithm for line, circle, ellipse, general curves, filling – scan line polygon fill algorithm, inside-outside tests, flood-fill, boundary-fill, attributes – area fill attributes, line and text attributes. [8]
3. **Two-Dimensional and Three-Dimensional Transformations:** Basic transformations, matrix representation and homogeneous co-ordinates, composite transformation, reflection, shear transformation.
[8]
4. **Three-Dimensional Object Representations:** Polygon surfaces, polygon tables, plane equations, polygon meshes, curved lines and surfaces, quadric surfaces, spheres, curves, spline representations and spline specifications, Bezier and B-spline curves.
[8]
5. **Clipping and Viewing:** Line clipping – Cohen Suther Land, Liang-Barsky, polygon clipping – Suther Land – Hodgman, Weiter-Atherton, projection and its transformation – parallel and perspective, vanishing points.
[8]
6. **Visibility:** Classification and detection algorithm, back face detection, depth – buffer, scan line, depth sorting and BSP tree, ray casting method and curved surfaces.
[4]

Text Books:

1. Hearn D. and Baker P. M., "Computer Graphics", Prentice-Hall of India, 2nd edition, 2004.
2. Newman W., and Sproul R. F., "Principles of Interactive Computer Graphics", McGraw-Hill, New York, 2nd ed, 1992.

Reference Books:

1. Foley J. D., and Van D. A., "Fundamentals of Interactive Graphics", Addison-Wesley, 2nd ed, 1983.
2. Roger D. F., "Procedural Elements for Computer Graphics", McGraw-Hill, New York, 2nd edition, 1985
3. Harrington S., "Computer Graphic", McGraw-Hill, New York, 2nd editon, 1995
4. Xiang Z., and Plastock R., "Theory and Problems of Computer Graphics", McGraw-Hill, New York, 2nd edition, 2000.

CA 711 Data Mining and Warehousing 3-0-0-3

Total Lectures:40

1. **Overview:** Concept of data mining and warehousing, data warehouse roles and structures, cost of warehousing data, roots of data mining, approaches to data exploration and data mining, foundations of data mining, web warehousing, web-warehousing for business applications and consumers, introduction to knowledge management, data warehouses and knowledge bases. [6]

2. **Data Warehouse:** Theory of data warehousing, barriers to successful data warehousing, bad data warehousing approaches, stores, warehouse and marts, data warehouse architecture, data about data - metadata, metadata extraction, implementing the data warehouse, data warehouse technologies. [4]

3. **Data Mining and Data Visualization:** Data mining, OLAP, techniques used to mine the data, market basket analysis, current limitations and challenges to DM, data visualization. [5]

4. **Designing and Building the Data Warehouse:** Theenterprise model approach of data mining design, data warehouse project plan, analysis and design tools, data warehouse architecture, specification and development**.** [5]

5. **Web-Based Query and Reporting:** Delivering information over the web, query and reporting tools and business value, architectural approaches to delivering query capabilities over the web. [3]

6. **Web Based Statistical Analysis and Data Mining:** Analytical tools, business value from analytical tools, humble spreadsheet, statistical products overview – statistical analysis applications, correlation analysis, regression analysis, data discovery tools. [6]

7. **Future of Data Mining and Data Warehousing:** Future of data warehousing, trends in data warehousing, future of data mining, using data mining to protect privacy, trends affecting the future of data mining, future of data visualization. [3]

Text Books:

1. Marakas G. M., “Modern Data Warehousing, Mining and Visualisation”, Pearson Education Asia, 2003.
2. Mattison R., “Web Warehousing and Knowledge Management”, Tata McGraw-Hill,2002.
3. Anahory S., and Murray D., “Data Warehousing in the Real World”, Pearson Education Asia,2002.

Reference Books:

1. Mallach E., “Decision Support and Data Warehousing”, Tata McGraw-Hill,2002.
2. Hand D., Mannila H., and Smyth P., “Principles of Data Mining”, Prentice-Hall of India, 2001.
3. Inmon W H., “Building the Data Warehouse”, Willey Computer Publishing, 4th edition,2005.
4. Prabhu C. S. R., “Data Warehousing”, Prentice-Hall of India, 2nd editon, 2004.

CA 709 **Distributed Systems** **3-1-0-4**

Total Lectures:40

1. **Characterization of Distributed Systems:** Definition, distributed systems- Internet, intranet, mobile, ubiquitous computing, resource sharing and World Wide Web challenges- heterogeneity, openness, security scalability failure handling concurrency and transparency. [4]
2. **System Models:** Architecture models- software layers, system architecture, variations on client-server model, interfaces and objects, design requirement for distributed architectures, fundamental models-interaction models, failure model and security model. [5]

3. **Distributed Object and Remote Invocation:** Introduction to remote method invocation (RMI) and interface in distributed systems, communication between distributed objects- objects model, distributed objects, distributed objects model and design issues for RMI, implementation of RMI and distributed garbage collection, remote procedures call and sun RPC case study, events and notifications-participants, JINI distributed event specification, Java RMI case study, building client and server programs, design and implementation of Java RMI. [10]

4. **Time and Global State:** Clocks, events and process states, synchronizing physical clocks- synchronization in a synchronous system, Cristian method for synchronizing clocks, Berkley algorithm and network time protocol, global state and consistent cuts. [5]

5. **Distributed Shared Memory:** Introduction, message passing versus DSM, implementation approaches to DSM, design and implementation issues-structure and synchronization model. [5]
6. **Processes and Processors in Distributed Systems:**Threads, system models, processor allocation, scheduling, fault tolerance. [5]

7. **Distributed File System:** Design, implementation, trends in distributed file system. [6]

Text Books:

1. Coulouris G., "Distributed System Concepts and Design", Pearson Education Asia, 3rd edition, 2003
2. Tannenbaum A. S., "Distributed Operating Systems", Pearson Education Asia,2001.

Reference Books:

1. Sinha P. K., "Distributed Operating Systems", Prentice-Hall of India, 2001.
2. Valduriez O., "Principles of Distributed Database Systems", Pearson Education Asia, 2nd edition, 2002.

CA 630 **Advanced DBMS** **3-1-0-4**

Total Lectures:40

1. **Parallel and Distributed Databases:** Database System Architectures: Centralized and Client-Server Architectures – Server System Architectures – Parallel Systems- Distributed Systems – Parallel Databases: I/O Parallelism – Inter and Intra Query Parallelism – Inter and Intra operation Parallelism – Distributed Database Concepts - Distributed Data Storage – Distributed Transactions – Commit Protocols – Concurrency Control – Distributed Query Processing – Three Tier Client Server ArchitectureCase Studies. [10]

2. **Object and Object Relational Databases:** Concepts for Object Databases: Object Identity – Object structure – Type Constructors – Encapsulation of Operations – Methods – Persistence – Type and Class Hierarchies – Inheritance – Complex Objects – Object Database Standards, Languages and Design: ODMG Model – ODL – OQL – Object Relational and Extended – Relational Systems : Object Relational featuresinSQL/Oracle – Case Studies. [8]

3. XML Databases: XML Databases: XML Data Model – DTD - XML Schema - XML Querying – Web Databases – JDBC – Information Retrieval – Data Warehousing – Data Mining. [7]

4. Mobile Databases: Mobile Databases: Location and Handoff Management - Effect of Mobility on Data Management - Location Dependent Data Distribution - Mobile Transaction Models - Concurrency Control - Transaction Commit Protocols- Mobile Database Recovery Schemes. [7]

5. Multimedia Databases: Multidimensional Data Structures – Image Databases – Text/Document Databases- Video Databases – Audio Databases – Multimedia Database Design. [8]

Text Books:

1. R. Elmasri, S.B. Navathe, “Fundamentals of Database Systems”, Fifth Edition, Pearson Education/Addison Wesley,2010.

2. Thomas Cannolly and Carolyn Begg, “ Database Systems, A Practical Approach to Design, Implementation and Management”, Third Edition, Pearson Education,2009.

Reference Books:

1. Henry F Korth, Abraham Silberschatz, S. Sudharshan, “Database System Concepts”, Fifth Edition, McGraw Hill,2005.

2. C.J.Date, A.Kannan and S.Swamynathan,”An Introduction to Database Systems”, Eighth Edition, Pearson Education,2006.

CA 633 **M -Commerce** **3-1-0-4**

Total Lectures:40

1. **Electronic Commerce:** Introduction, e-commerce marketplace, Focus on portals, Location of trading in the marketplace, Commercial arrangement for transactions , auctions business models for e-commerce, Revenue models, E-commerce versus E-business. [6]

2. **Mobile Commerce:** Overview, Infrastructure, Types of Mobile Commerce Services, Technologies of Wireless Business, Benefits and Limitations, Support, Mobile Marketing and Advertisement, Non Internet Applications in M–Commerce. [6]

3. **Mobile Commerce Technology:** Framework of Mobile Commerce,NTT Docomo‘s I– Mode, Wireless Devices for Mobile Commerce, Classification of Framework for Mobile Location Based Services, Wireless Personal and Local Area Networks, The Impact of Technology in Mobile Communications Networks. [7]

4. **Mobile Commerce Theory and Applications:** The Ecology of Mobile Commerce, Wireless Application Protocol, Mobile Business Services, Mobile Portal, Factors affecting the Adoption of Mobile Gaming Services, Mobile Data Technologies and Small Business Adoption and Diffusion. [5]

5. **Business– to– Business Mobile E-Commerce:** Enterprise Enablement, Email and Messaging, Field Force Automation, maintenance and management, Remote IT Support Customer Retention, B2C Services, Warehouse automation security. [6]

Text Books:

1. Chaffey Dave, “E-Business and E-Commerce Management”, Pearson Education, Third Edition, 2009,.

2. Mennecke Brian E., Strader Troy J., “Mobile Commerce: Technology, Theory andApplications”, Idea Group Inc., IRM press,2003.

Reference Books:

1. Louis P. J., “M-Commerce Crash Course”, McGraw- Hill,2001.

2. May Paul, “Mobile Commerce: Opportunities, Applications, and Technologies of Wireless Business” Cambridge University Press,2001.

3. Papazoglou Michael P., Ribbers Peter M.A., “e-business organizational and Technical foundation”,Wiley India,2009.

4. Dr.Pandey , Shukla Saurabh “E-commerce and Mobile commerce Technologies” , Sultanchand ,2011.

CA 631 **Real Time Systems** **3-1-0-4**

Total Lectures:40

1. **Introduction:** Issues in Real Time Computing, Structure of a Real Time System. Task Classes, Performance Measures for Real Time Systems, Estimating Program Run times. Task Assignment and Scheduling -Classical Uniprocessor scheduling algorithms, UniProcessor scheduling of IRIS Tasks, Task Assignment,Mode Changes, and Fault Tolerant Scheduling. [8]

2. **Programming Language and Tools:** Desired Language characteristics, Data Typing, Control structures,Facilitating Hierarchical Decomposition, Packages, Run-time (Exception) Error handling, Overloading andGenerics, Multitasking, Low Level programming, Task scheduling, Timing Specifications, Programming Environments, Run-time Support. [8]

3. **Real time Databases**: Basic Definition, Real time Vs General Purpose Databases, Main Memory Databases,Transaction priorities, Transaction Aborts, Concurrency Control Issues, Disk Scheduling Algorithms, Two-phase Approach to improve Predictability, Maintaining Serialization Consistency, Databases for Hard Real Time systems. [8]

4. **Real-Time Communication**: Communications Media, Network Topologies Protocols, Fault TolerantRouting. Fault Tolerance Techniques - Fault Types, Fault Detection. Fault Error containment Redundancy,Data Diversity, Reversal Checks, Integrated Failure handling. [8]

5. **Reliability Evaluation Techniques**: Obtaining Parameter Values, Reliability Models for HardwareRedundancy, Software Error models. Clock Synchronization - Clock, A Nonfault-Tolerant SynchronizationAlgorithm, Impact of Faults, Fault Tolerant Synchronization in Hardware, Fault Tolerant Synchronization in Software. [8]

Text Books:

1. C.M. Krishna, Kang G. Shin, “Real-Time Systems”, McGraw-Hill International Editions,1997.

1. Stuart Bennett, “Real Time Computer Control-An Introduction”,Second edition Perntice Hall PTR,1994.

Reference Books:

1. Peter D. Lawrence, “Real time Micro Computer System Design – An Introduction”, McGraw Hill,1988.
2. S.T. Allworth and R.N. Zobel, “Introduction to real time software design”, Macmillan, II Edition,1987.

CA 632 **Software Project Management** **3-1-0-4**

Total Lectures:40

1.**Introduction To Software Project Management :**Project Definition – Contract Management – Activities Covered By Software Project Management – Overview Of Project Planning – Stepwise Project Planning. [6]

2. **Project Evaluation :** Strategic Assessment – Technical Assessment – Cost Benefit Analysis – Cash Flow Forecasting – Cost Benefit Evaluation Techniques – Risk Evaluation. [6]

3. **Activity Planning:** Objectives – Project Schedule – Sequencing and Scheduling Activities – Network Planning Models – Forward Pass – Backward Pass – Activity Float – Shortening Project Duration – Activity on Arrow Networks – Risk Management – Nature Of Risk – Types Of Risk – Managing Risk – Hazard Identification – Hazard Analysis – Risk Planning And Control. [9]

4. **Monitoring And Control:** Creating Framework – Collecting The Data – Visualizing Progress – Cost Monitoring – Earned Value – Priortizing Monitoring – Getting Project Back To Target – Change Control – Managing Contracts – Introduction – Types Of Contract – Stages In Contract Placement – Typical Terms Of A Contract – Contract Management – Acceptance. [9]

5. **Managing People And Organizing Teams:** Introduction – Understanding Behavior – Organizational Behaviour: A Background – Selecting The Right Person For The Job – Instruction In The Best Methods – Motivation – The Oldman – Hackman Job Characteristics Model – Working In Groups – Becoming A Team –Decision Making – Leadership – Organizational Structures – Stress –Health And Safety – Case Studies. [10]

Text Books:

1. Bob Hughes, Mikecotterell, “Software Project Management”, Third Edition, Tata McGraw Hill,2011.

2. Ramesh, Gopalaswamy, "Managing Global Projects", Tata McGraw Hill,2001.

Reference Books:

1. Jalote, “Software Project Management in Practice”, Pearson Education,2002.

2. Royce, “Software Project Management”, Pearson Education,2005.

CA 644 **Artificial Intelligence** **3-1-0-4**

Total Lectures:40

1. **Introduction:** Overview of artificial intelligence (AI) and AI techniques. [3]
2. **Problem Solving:** Searching, state space formulation, depth first & breadth first searches and intelligent searching. [7]
3. **Production Systems:** Design, implementation & limit factors and case studies. [7]
4. **Game Playing:** Minimax and Alpha-beta pruning. [6]
5. **Knowledge and Reasoning:** Propositional & first order topic, semantic networks, inference and logical reasoning systems. [6]
6. **Knowledge Representation:** CD, frames & scripts, learning and neural networks. [6]
7. **Advanced Topics:** Expert system, natural language processing, PROLOG. [5]

Text Books:

1. Rich E., and Knight K., Artificial Intelligence, Tata McGraw-Hill, 2nd ed,2008.
2. Bratko I., PROLOG Programming for Artificial Intelligence, 3rd ed,2001.

Reference Books:

1. Russell S., and Norvig P., Artificial Intelligence – A Modern Approach, Prentice-Hall of India, 2nd ed,2009.
2. Patterson D. W., Introduction to Artificial Intelligence and Expert Systems, Prentice-Hall of India,1990.

CA 642 **Digital Image Processing** **3-1-0-4**

Total Lectures:40

1. **Introduction:** Background, Digital Image Representation, Fundamental Steps in Image Processing, Elements of a Digital Image Processing System. Elements of Visual Perception, A Simple Image Model, Sampling and Quantization, Some Basic Relationships between Pixels, Imagining Geometry. [8]
2. **Image Transforms:** Introduction to the Fourier Transform, The Discrete Fourier Transform, Some Properties of the Two-Dimensional Fourier Transform, Other Separable Image Transforms. [8]
3. **Image Enhancement :** Spatial Domain Methods, Frequency Domain Methods, Some Simple Intensity Transformations, Histogram Processing, Image Subtraction, Image Averaging, Background, Smoothing Filters, Sharpening Filters, Lowpass Filtering, Highpass Filtering, Generation of Spatial Masks from Frequency Domain Specifications. [8]
4. **Image Restoring:** Degradations Model - Definitions, Degradation Model for Continuous Functions, Diagonalization of Circulant and Block-Circulant Matrices, Circulant Matrices, Block Circulant Matrices, Effects of Diagonalization on the Degradation Model, Algebraic Approach to Restoration, Unconstrained Restoration, Constrained Restoration, Inverse Filtering – Formulation, Removal of Blur Caused by Uniform Linear Motion, Restoration in the Spatial Domain, Geometric Transformation. [8]

5. **Image Compression:** Fundamentals – Coding Redundancy, Interpixel Redundancy, Psychovisual Redundancy, Fidelity Criteria. Image Compression Models,The Channel Encoder and Decoder. Elements of Information Theory Measuring Information, The Information Channel, Fundamental Coding Theorems, Using Information Theory. Error-Free Compression. Lossy Compression. [8]

Text Book:

1. Rafael. C. Gonzalez & Richard E.Woods., “Digital Image Processing”, 2/e Pearson Education, New Delhi.2009.

Reference Books:

1. W.K.Pratt., “Digital Image Processing” ,3/e Edn., John Wiley and sons, Inc,2001.

2. M. Sonkaet.al “Image Processing, Analysis and Machine Vision”, 2/e, Thomson, Learning, India Edition,1998.

CA 646 **Parallel Processing** **3-1-0-4**

Total Lectures:40

1. **Parallel Processing:** Introduction, data and control parallelism, (concurrency, scalability, speedup, Amolahl's Law), PRAM model of parallel computation, parallel algorithm design. [8]
2. **Multiprocessors and Multicomputers:** Processor organization, shared memory and message passing systems, message passing interface programming with respect to PARAM 10000. [9]
3. **Array Processing:** SIMD array processing, communications, SIMD interconnection networks, algorithms for array processing. [8]
4. **Applications:** Parallel algorithms for matrix multiplication, fast Fourier transform, linear systems, sorting, numerical integration, and optimization. [7]
5. **Parallel Programming Languages:** C, C++ and high performance FORTRAN. [8]

Text Books:

1. Hwang K., "Advanced Computer Architecture", Tata McGraw-Hill,2003.
2. Quinn M. J., "Parallel Computing", Tata McGraw-Hill, 2nd ed,2002.

Reference Books:

1. Hwang K. and Briggs F. A., "Computer Architecture and Parallel Processing", McGraw-Hill, New York.,1984.
2. Sinha P. K., "Distributed Operating System", Prentice-Hall of India,1997.

CA 648 **Service Oriented Architecture** **3-1-0-4**

Total Lectures:40

1. **Roots of SOA**: Characteristics of SOA - Comparing SOA to client-server and distributed internet architectures – Anatomy of SOA- How components in an SOA interrelate - Principles of service orientation. [5]

2. **Web Services**: Service descriptions – Messaging with SOAP –Message exchange Patterns – Coordination –Atomic Transactions – Business activities – Orchestration – Choreography - Service layer abstraction –Application Service Layer – Business Service Layer – Orchestration Service Layer [9]

3**. Service Oriented Analysis**: Business-centric SOA – Deriving business services- service modeling - Service Oriented Design – WSDL basics – SOAP basics – SOA composition guidelines – Entity-centric business service design – Application service design – Task- centric business service design [9]

4. **SOA Platform Basics**: SOA support in J2EE – Java API for XML-based web services (JAX-WS) - Java architecture for XML binding (JAXB) – Java API for XML Registries (JAXR) - Java API for XML based RPC (JAX-RPC)- Web Services Interoperability Technologies (WSIT) - SOA support in .NET – Common Language Runtime - ASP.NETweb forms – ASP.NET web services – Web Services Enhancements (WSE) [10]

5.WS-BPEL Basics: WS-Coordination overview - WS-Choreography, WS-Policy, WS-Security. [7]

Text Books:

1. Thomas Erl, "Service-Oriented Architecture: Concepts, Technology, and Design", Pearson Education,2005.

Reference Books:

1. Thomas Erl, "SOA Principles of Service Design" The Prentice Hall,2007.
2. Newcomer, Lomow, "Understanding SOA with Web Services", Pearson Education,2005.
3. Sandeep Chatterjee, James Webber, "Developing Enterprise Web Services, An Architect's Guide", Prentice Hall Professional, 2004.

CA 741 **Advanced Data structures** **3-1-0-4**

Total Lectures:40

1. **Basic Concepts Of Oops**: Templates Function and class templates – Algorithms: performance analysis: time complexity and space complexity– ADT – List (Singly– Doubly and Circular) Implementation – Array – Pointer – Cursor Implementation [8]

2. **Stacks And Queues**: ADT– Implementation and Applications – Trees – General– Binary – Binary Search – Expression Search – AVL – Introduction to Red Black trees and Splay tree – B Trees – Implementations – Tree Traversals . [10]

3. **Set – Implementation**: Basic Operations on Set – Priority Queue – Implementation – Graphs – Directed Graphs – Shortest Path Problem – Undirected Graph – Spanning Trees – Graph Traversals:hash table representation: hash functions: collision resolution:separate chaining: open addressing:linear probing: quadratic probing: double hashing: rehashing [8]
4. **Issues** : Managing Equal Sized Blocks – Garbage Collection Algorithms for Equal Sized Blocks – Storage Allocation for Objects with Mixed Sizes – Buddy Systems – Storage Compaction [6]

5. **Searching Techniques**: Sorting – Internal Sorting – Bubble Sort – Insertion Sort – Quick Sort – Heap Sort – Bin Sort – Radix Sort – External Sorting – Merge Sort – Multiway Merge Sort – Polyphase Sorting – Design Techniques – Divide and Conquer – Dynamic Programming – Greedy Algorithm – Backtracking – Local Search Algorithms. [8]

Text Books:

1. Weiss Mark Allen, “Data Structures and Algorithm Analysis in C++”, Pearson Education, 2002.
2. Aho,Hopcroft and Ullman, “Data Structures and Algorithms”, Pearson Education,2000.
3. Horowitz, Sahni and Rajasekaran, “Computer Algorithms”, Galgotia,2014.

Reference Books:

1. Tanenbaum A.S, Langram Y, Augestien M.J., “Data Structures using C & C++”, Prentice Hall of India,2002.
2. Sahni S. “Data structures, Algorithms and Applications in C++”, , University Press (India) Pvt.Ltd, 2nd edition, Universities Press Orient Longman Pvt. Ltd,2005.

CA 743 **Cloud Computing** **3-1-0-4**

Total Lectures:40

1. **Cloud Architecture and Model:** Technologies for Network-Based System – System Models for Distributed and Cloud Computing – NIST Cloud Computing Reference Architecture. Cloud Models:- Characteristics – Cloud Services – Cloud models (IaaS, PaaS, SaaS) – Public vs Private Cloud –Cloud Solutions - Cloud ecosystem – Service management – Computing on demand. [8]

2. **Virtualization:** Basics of Virtualization - Types of Virtualization - Implementation Levels of Virtualization - Virtualization Structures - Tools and Mechanisms - Virtualization of CPU, Memory, I/O Devices - Virtual Clusters and Resource management – Virtualization for Data-center Automation. [8]

3. **Cloud Infrastructure:** Architectural Design of Compute and Storage Clouds – Layered Cloud Architecture Development – Design Challenges - Inter Cloud Resource Management – Resource Provisioning and Platform Deployment – Global Exchange of Cloud Resources. [8]

4. **Programming Model:** Parallel and Distributed Programming Paradigms – MapReduce , Twister and Iterative MapReduce – Hadoop Library from Apache – Mapping Applications - Programming Support - Google App Engine, Amazon AWS - Cloud Software Environments - Eucalyptus, Open Nebula, OpenStack, Aneka, CloudSim. [8]

5. **Security In The Cloud:** Security Overview – Cloud Security Challenges and Risks – Software-as-a-Service Security – Security Governance – Risk Management – Security Monitoring – Security Architecture Design – Data Security – Application Security – Virtual Machine Security - Identity Management and Access Control – Autonomic Security. [8]

Text Books:

1. Hwang Kai, Fox Geoffrey C, Dongarra Jack G, “Distributed and Cloud Computing, From Parallel Processing to the Internet of Things”, Morgan Kaufmann Publishers,2011.

2. Rittinghouse John W. and Ransome James F., “Cloud Computing: Implementation, Management, and Security”, CRC Press,2009.

Reference Books:

1. Velte Toby, Velte Anthony, Elsenpeter Robert, “Cloud Computing, A Practical Approach”, TMH,2013.
2. Kumar Saurabh, “Cloud Computing – insights into New-Era Infrastructure”, Wiley India,2011.
3. George Reese, “Cloud Application Architectures: Building Applications and Infrastructure in the Cloud” O'Reilly,2009.
4. James E. Smith, Ravi Nair, “Virtual Machines: Versatile Platforms for Systems and Processes”, Elsevier/Morgan Kaufmann,2005.

CA 745 **Compiler Design** **3-1-0-4**

Total Lectures:40

1. **Introduction To Compiling:** Compilers – Analysis of the source program – Phases of a compiler – Cousins of the Compiler – Grouping of Phases – Compiler construction tools - Lexical Analysis-Role of Lexical Analyzer – Input Buffering – Specification of Tokens. [8]

2. **Syntax Analysis:** Role of the parser –Writing Grammars –Context-Free Grammars – Top Down parsing - Recursive Descent Parsing - Predictive Parsing – Bottom-up parsing - Shift Reduce Parsing – Operator Precedent Parsing - LR Parsers - SLR Parser - Canonical LR Parser - LALR Parser. [8]

3. **Intermediate Code Generation:** Intermediate languages – Declarations – Assignment Statements – Boolean Expressions – Case Statements – Back patching – Procedure calls. [8]

4. **Code Generation:** Issues in the design of code generator – The target machine – Runtime Storage management – BasicBlocks and Flow Graphs – Next-use Information – A simple Code generator – DAG representation of BasicBlocks – Peephole Optimization. [8]

5. **Code Optimization And Run Time Environments:** Introduction– Principal Sources of Optimization – Optimization of basic Blocks – Introduction to Global Data Flow Analysis – Runtime Environments – Source Language issues – Storage Organization – StorageAllocation strategies – Access to non-local names – Parameter Passing. [8]

Text Books:

1. Aho Alfred, Sethi Ravi and Ullman Jeffrey D, "Compilers Principles, Techniques and Tools", Pearson Education Asia,1986.

Reference Books:

1. Holub Allen I. "Compiler Design in C", Prentice Hall of India,2003
2. Fischer C. N. and LeBlanc R. J., "Crafting a compiler with C", Benjamin Cummings,1991.

CA 747 **Neural Network** **3-1-0-4**

Total Lectures:40

1. Introduction : Features , structure and working of Biological Neural Network Trends in Computing Comparison of BNN and ANN, History of neural network research, characteristics of neural networks terminology, models of neuron McCulloch – Pitts model, Perceptron, Adaline model, Basic learning laws, Topology of neural network architecture. [10]

2. Back Propagation Networks : Architecture of feed forward network, single layer ANN, multilayer perceptron, back propagation learning, input - hidden and output layer computation, backpropagation algorithm, applications, selection of tuning parameters in BPN, Numbers of hidden nodes, learning. [8]

3. Activation and Synaptic Dynamics : Introduction, Activation Dynamics models, synaptic Dynamics models, stability and convergence, recall in neural networks. [6]

4. Basic functional units of ANN for pattern recognition tasks: Basic feedforward, Basic feed back and basic competitive learning neural network. Pattern association, pattern classification and pattern mapping tasks. [6].

5. Competitive learning neural networks : Components of CL network pattern clustering and feature mapping network, ART networks, Features of ART models, character recognition using ART network**.** [7]

6. Applications of ANN : Pattern classification – Recognition of Olympic games symbols, Recognition of printed Characters. Neocognitron. [3].

Text Books:

1. Yegnanarayana B., "Artificial Neural Networks", PHI,1999.
2. sekaran S. Raj , Pari Vijayalakshmi, "Neural networks, Fuzzy logic and Genetic Algorithms", PHI.

Reference Books:

1. Kumar Satish, "Neural Networks", PHI,2013.

CA 731 Advanced Java Laboratory 0-0-4-2

1. Collections : Collection Interfaces, Concrete Collections, The Collections Framework

2. Multithreading : Creating thread and running it, Multiple Thread acting on single obj ect,Synchronization, Thread communication, Thread group, Thread priorities, Daemon Thread, Life Cycle of Thread

3. Networking: Internet Addressing, InetAddress, Factory Methods, Instance Methods, TCP /IP Client Sockets, URL, URL Connection, TCP/IP Server Sockets, Datagrams

4. Enterprise Java Bean: Preparing a Class to be a JavaBean, Creating a JavaBean, JavaBean Properties, Types of beans, Stateful Session bean, Stateless Session bean, Entity bean.

5. Java Database Connectivity (JDBC): Merging Data from Multiple Tables: Joining, M anipulating, Databases with JDBC, Prepared Statements, Transaction Processing, Stored Procedures C.

6.Servlet: Overview and Architecture, Interface Servlet and the Servlet Life Cycle Handling HTTP get Requests, Handling HTTP post Requests, Redirecting Requests to Ot her Resources, Session Tracking, Cookies, Session Tracking with HttpSession.

7. JavaServer Pages (JSP): Introduction, JavaServer Pages Overview, First JavaServer Page Example, Implicit Objects, Scripting, Standard Actions, Directives, Custom Tag Libraries.

CA 729 **DOT Net Laboratory** **0-0-4-2**

1. VB .NET

Introduction to .Net framework and architecture, Language basics, Programming fundamentals, Oop's concepts & its implementation in VB .Net, Component based programming, File Handling, Serialization(XML, Binary), ADO .Net Programming (SQL express), Web services, Windows services , Multithreading, .Net remoting

2. ASP .NET

Web Application Basics, ASP.NET Architecture, ASP.NET Server Controls, ASP.NET State Management, ASP.NET Data Access, ASP.NET Look & Feel , ASP.NET Security, ASP.NET Personalization, ASP.NET Navigation, ASP.NET Provider Model, ASP.NET Web Administration, ASP.NET 2.0 Webpart Personalization, ASP.NET Web Service, ASP.NET AJAX

3. C# .NET

Introduction To C#, Developing C# Application using VS, Variables and Expressions, Flow Control, Introduction to OOPS, More About Classes, Events, Advanced Windows Forms Features, Introduction to GDI+, Data Access with ADO.NET, Working With Files in C#, Assemblies in .NET, Integration and Interoperability

CA 727 **PHP Laboratory** **0-0-4-2**

1. Introduction

Testing

- Basic Syntax
- Defining variable and constant
- Php Data type
- Operator and Expression

Programs

- Apply logic to print different patterns(at least 3)
- Programs like to print Fibonacci series, check whether a number is prime or not
- Max and min of a given list of numbers, their sum and average
- Result of a student using switch-case
- 3 application programs based on above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.

2. Handling Html Form

Testing

- Capturing Form Data
- Dealing with Multi-value filed
- Generating File uploaded form
- Redirecting a form after submission

Programs

- Design a form
- Submit values of form to server and display back to client.
- Receiving values from different GUI elements
- Generate form elements dynamically.

3. Decisions and loop

Testing

- Making Decisions
- Doing Repetitive task with looping

- Mixing Decisions and looping with Html

Programs

- Write and execute a program to print 5 rows and 5 column if input is one else 10 rows and 5 column.
- Generate numbers of rows in a table dynamically on different inputs 1,2,3 etc.
- Write a program in which implements the concept of multiple inheritance.
- Generate hyperlink dynamically.

4. Function

Testing

- Define a function
- Call by value and Call by reference
- Recursive function

Programs

- 5 application programs based on above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.

5. Strings

Testing :

- Creating and accessing String
- Searching & Replacing String
- Formatting String
- String Related Library function

Program:

- 5 application programs based on above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.

6. Arrays

Testing:

- Anatomy of an Array
- Creating index based and Associative array
- Accessing array Element
- Looping with Index based array
- Looping with associative array using each() and foreach()

- Some useful Library function

Program:

- 5 application programs based on above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.

7. Working with files:

Testing

- Understanding file& directory
- Opening and closing a file Coping
- ,renaming and deleting a file
- Working with directories
- Building a text editor
- File Uploading & Downloading

Program:

- 5 application programs based on above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.

Mody University of Science & Technology

College of Engineering & Technology

Department of CSE

Course structure for

M. Tech VLSI

M.Tech. VLSI Design

Two-Year Programme

Academic Curriculum (2012 – 13 onwards)

First Year

	Course Code	Course Title	Contact Hours per Week			Credits	ETE Duration	Weightage (%)		
			L	T	P		Hours	CW*	MTE**	ETE
Autumn Semester	EC 541	Semiconductor Device Models for Circuit Simulation	3	1	0	4	3	10	40	50
	EC 543	VLSI Fabrication Technology	3	1	0	4	3	10	40	50
	EC 545	Elements of Digital VLSI Design	3	1	0	4	3	10	40	50
	MA 509	Advanced Mathematics	3	1	0	4	3	10	40	50
		Elective I	3	1	0	4	3	10	40	50
	EC 555	Digital VLSI Design Laboratory	0	0	4	2	2	20	40	40
	HS 501	Technical Communication (optional)***	2	0	0	2	2	10	40	50
	Sub Total		**17**	**5**	**4**	**24**	**-**			

	Course Code	Course Title	Contact Hours per Week			Credits	ETE Duration	Weightage (%)		
			L	T	P		Hours	CW*	MTE**	ETE
Spring Semester	EC 542	Analog VLSI Design	3	1	0	4	3	10	40	50
	EC 544	VLSI Systems and Subsystems	3	1	0	4	3	10	40	50
	EC 550	Embedded Systems Design	3	1	0	4	3	10	40	50
		Elective II	3	1	0	4	3	10	40	50
		Elective III	3	1	0	4	3	10	40	50
	EC 572	Analog VLSI Design Laboratory	0	0	4	2	2	20	40	40
	EC 574	HDL Programming Laboratory	0	0	4	2	2	20	40	40
	HS 501	Technical Communication (optional)***	2	0	0	2	2	10	40	50
	Sub Total		**17**	**3**	**8**	**26**	**-**			

M.Tech. VLSI Design

Two-Year Programme

Academic Curriculum (2012 – 13 onwards)

Second Year

	Course Code	Course Title	Contact Hours per Week			Credits	ETE Duration	Weightage (%)		
			L	T	P		Hours	CW*	MTE**	ETE
Autumn Semester	EC 601	Seminar	-	-	-	4	-	100		
	EC 603	Project	-	-	-	4	-	100		
	EC 607	Dissertation Preliminary	-	-	-	16	-	100		
	Sub Total		**-**	**-**	**-**	**24**	**-**			

	Course Code	Course Title	Contact Hours per Week			Credits	ETE Duration	Weightage (%)		
			L	T	P		Hours	CW*	MTE**	ETE
Spring Semester	EC 608	Dissertation Final	-	-	-	20	-	100		
	Sub Total		**-**	**-**	**-**	**20**	**-**			

Total Credits = 24+26+24+20 = 94

* **Theory:Assignments and regularity** will be evaluated out of 10(ten) marks in a semester.
Practicals: Practical record and regularity will be evaluated 4 (four) times in a semester. Each evaluation will be out of 10 (ten) marks.

**** Theory :**Two mid-term examinations of 20 (twenty) marks each.
Practicals: Viva/quizzes will be held 4 (four) times in a semester, each of 10 (ten) marks.

******* The student may decide to take HS 501 in either of the semesters or even may not opt for this optional paper by consulting the course coordinator. If a student opts to take this paper, the appropriate credit shall be added to his/her account.

M.Tech. VLSI Design

Two-Year Programme
Academic Curriculum (2009 – 10 onwards)

List of Electives

Autumn Semester (Elective I)

1.	EC 553	Design of Digital Systems
2.	EC 502	FPGA Architecture & Applications

Spring Semester (Elective II)

3.	EC 548	VLSI Physical Design and Design Automation
4.	EC 504	ASIC Design

Spring Semester (Elective III)

5.	EC 556	Low power VLSI Technology
6.	EC 546	Mixed-Signal Systems

Total Lectures 40

EC 541 Semiconductor Device Models for Circuit Simulation 3-1-0-4

1. Principle of circuit simulation and its objectives. [4]

2. Introductions to SPICE- DC, small signal, large signal, high frequency, noise models of diodes and measurement of diode model parameters. [6]

3. DC, small signal, high frequency and noise models of bipolar junction transistors, extraction of bipolar junction transistor model parameters. [6]

4. DC, small signal, high frequency and noise model of MOSFETs. [5]

5. Devices scaling, short and narrow channel MOSFETs. [5]

6. MOSFET channel mobility model, level-1 and level-2 large signal MOSFET Models. [4]

7. Extraction of MOSFET model parameters. [5]

8. JFET and MESFETs, extraction of JFET and MESFET model parameters. [5]

Text Books:

1. Dasgupta N., and Dasgupta A., Semiconductor Devices - Modeling and Technology, Prentice-Hall of India, 2004.
2. Ben G. Streetman, Sanjay Banerjee, "Solid State Electronic Devices", Prentice Hall.
3. Adir Bar-Lev, "Semiconductors and electronic devices", Prentice-Hall International.

Total Lectures 40

EC 543 VLSI Fabrication Technology 3-1-0-4

1. Crystal growth and Epitaxy [3]
2. Diffusion and Ion-implantation [4]
3. Oxidation Processes [3]
4. Film Deposition Techniques [4]
5. Etching and Cleaning [4]
6. Lithographic Processes [5]
7. Metal Deposition and Interconnect Formation [2]
8. Process Integration : Bipolar and MOS (NMOS & CMOS) [7]
9. Packaging [3]
10. Testing [3]
11. Reliability and Yield [2]

Text Books:

1. Gandhi S. K., VLSI Fabrication Principles – Silicon and Gallium Arsenide, John Wiley & Sons, 2nd Ed., 2003.
2. A.I.C.T.E, Design and Fabrication Technology, A.I.C.T.E, Bangalore, 2001.
3. *S. M. Sze*, "*VLSI Technology"*, Second Edition, McGraw-Hill.

Total Lectures 40

EC 545 Elements of Digital VLSI Design 3-1-0-4

1.	CMOS Technology & Device Scaling	[6]
2.	Stick Diagram, Layout and Full Custom Mask Design	[4]
3.	MOS inverters : Static and Dynamic Characteristics	[4]
4.	Inverter Delay and Power Dissipation	[5]
5.	Interconnect delay	[2]
6.	Combinational MOS Logic Circuits	[4]
7.	Sequential MOS Logic Circuits	[4]
8.	Dynamic Logic Circuits	[3]
9.	Low power VLSI Circuits	[4]
10.	Introduction to BiCMOS Circuits	[2]
11.	Introduction to FPGA and ASICS	[2]

Text Books:

1. Weste N. H., Principles of CMOS VLSI Design, Pearson Education Asia, 2nd Ed., 2001.
2. Kang S., CMOS Digital Integrated Circuits Analysis and Design, Tata McGraw-Hill, 3rd Ed., 2003.
3. Baker J. R., CMOS - Circuit Design, Layout and Simulation, Prentice-Hall of India, 2000.

Total Lectures 40

MA 509 Advanced Mathematics 3-1-0-4

1. Computer based numerical methods:

   Methods for numerical solution of algebraic and transcendental equations: Direct methods e.g. Bisection method, Regula-Falsi method; Iterative method e.g. Newton-Raphson method.

   Methods for the solution of simultaneous linear equations: Direct methods e.g. Gauss elimination method; Iterative method e.g. Gauss-Seidel method, Jacobi method

Finite difference table for equal and unequal intervals in the independent variable values.Newton's forward and backward interpolation formula; Newton's interpolation formula for divided differences.Numerical differentiation. Numerical Integration methods: Simpson's rules, Trapezoidal rule and Romberg's method.

Numerical solution of ordinary differential equations: Euler method, Modified Euler method and Runge-Kutta methods.

Numerical solution of elliptic and parabolic differential equations using finite difference approach. [20]

2. Statistics and Probability:

   Concept of random variable, total and conditional probability, Bayes' theorem,probability distributions and probability density functions, moments and moment generating functions. Some theoretical probability distributions such as binomial, Poisson, normal, uniform, exponential, rectangular, χ^2, t, F.Sampling theory, sampling distributions and sampling techniques.Estimation theory, Point and Interval estimation of mean and variance of data.Testing of hypotheses.Simple and Composite hypothesis.Correlation and Regression.Multiple and Partial correlation and regression.Concepts of stochastic processes with special reference to Monte Carlo methods. [20]

Text Books

1. Shastri S.S., Introductory Method of Numerical Analysis, Prentice-Hall of India, 3rd Ed., 2002.
2. Trivedi K.S., Probability and Statistics with Reliability Queuing and Computer Science Application, Prentice-Hall of India, 2002.

Reference Book

1. Dass H.K., Advanced Engineering Mathematics, S. Chand and Company Ltd., 1999.

Tool Used: Tanner EDA Tool version 13.0

1. Verify the characteristics of NMOS as strong '0' and weak '1'.
2. For the given circuit draw I_D verses V_{GS} and I_D verses V_{DS}.
3. Design the schematic and layout of inverter having $(W/L)_n=1$ and $(W/L)_p=3(W/L)_n$.
4. Find out V_{OH}, V_{OL} of the following inverters:-
   (a) Resistive Load Inverter.
   (b) E-Type Saturated Load Inverter.
   (c) E-Type Linear Load Inverter.
5. Implement the Expression using CMOS technology:-
   $Z=\overline{A(D+E)+BC}$
6. Implement the Expression using CMOS technology:-
   $Z=\overline{(D+E+A)(B+C)}$
7. Design the schematic and layout of two input NAND and NOR gate.
8. Design the schematic and layout of 10 transistor 1 bit full adder.
9. Design $Z = AB + \bar{A}\bar{C} + A\bar{B}C$ using transmission gate.
10. Design the sum module of 1-bit full adder using transmission gates.
11. Design 2-bit equality detector using pass transistors logic.

HS 501 Technical Communication 2-0-0-2

1. **Process of Communication:** Clarity in pronunciation based on International Phonetic Alphabet and awareness of colloquial expressions. [7]

2. **Composition:** Letter Writing, resume writing, theme development, formats for introducing, instructing, persuading, referencing and summarizing. [7]

3. **Report Writing:** Types of reports and structure of formal reports. [4]

4. **Presentations:** Making presentations and participating in group discussions, importance of sequential presentations. [5]

5. **Miscellaneous:** Analyzing strategies and their correlation with writing patterns and editing information. [5]

Text Books:

1. Gerson S.G., and Gerson S.M., Technical Writing, Pearson Education Asia, 2001.
2. Sharma R.C., and Mohan K., Business Correspondence and Report Writing, Tata McGraw-Hill,13th Ed.,1999.
3. Balasubramanian T., A Textbook of English Phonetics, Macmillan Publication, 2001.

Total Lectures 40

EC 542 Analog VLSI Design 3-1-0-4

1. Basic consideration in analog VLSI design. [4]

2. MOS current sources, current mirrors, out buffers and voltage reference circuits. [6]

3. CMOS amplifier. [7]

4. Noise in CMOS amplifier. [3]

5. CMOS comparators. [6]

6. Mixed signal circuits. [6]

7. MOS circuit components. [4]

8. Switched capacitor filters realization by MOS technology. [4]

Text Books:

1. Razavi B., Design of Analog CMOS Integrated Circuits, McGraw-Hill, New York, 2001.
2. D. Johns and K. *Martin*, "*Analog Integrated Circuit Design*", *John* Wiley & Sons.
3. P. E. Allen and D. R. Holberg, "CMOS Analog Circuit Design", Oxford university press.

Total Lectures 40

EC 544 VLSI Systems and Subsystems 3-1-0-4

1. System specification using HDL. [6]
2. General VLSI Components. [7]
3. Arithmetic circuits in CMOS VLSI. [5]
4. Memories and Programmable logic. [7]
5. System level physical design. [7]
6. VLSI clocking and system design. [6]
7. Reliability and testing of VLSI circuits [2]

TextBooks:

1. Hill F. J., and Peterson G. R., Computer Aided Logical Design with Emphasis on VLSI, John Wiley & Sons, 4th Ed., 1993.
2. Wolf W., Modern VLSI Design- System-On-Chip Design, Pearson Education Asia, 3rd Ed., 2002.
3. John P. Uyemura, "Introduction to VLSI Circuits and Systems", John Wiley & Sons.

Total Lectures 40

EC 550 Embedded System Design 3-1-0-4

1. **Introduction to Embedded System & Design Concepts:** Introduction & examples of embedded system, Concept of embedded system design , design challenges, processor technology & IC technology, Embedded processor & general purpose processor, trades-offs, development phase of embedded system & use of software tools for development of embedded system . [4]

2. **Embedded Processor Architecture/Microcontrollers:** Role of processor selection in embedded system, overviews of 8-bits/16-bits/32-bits microcontrollers, 8051 microcontroller: Architecture, basic assembly language programming concepts, instruction sets, addressing modes, logical operations, arithmetic operations, branching instructions, Boolean instructions, subroutines, timing subroutine, serial data communication & interrupt process, assembly language programming examples [8]

3. **Interfacing, programming & real-time applications:** Memory & I/O interfacing, Timer & counter operation & Programming, Serial communication,& interrupt handling, LCD & keyboard interfacing, DS 12887 RTC interfacing, interfacing ADC/DAC, real world interfacing & applications. [12]

4. **Embedded software Architecture & Development:** Challenges & issues in an embedded software development, real-time programming language & embedded OS, Embedded software architecture: Round-Robin, Round-Robin with interrupt, RTOS architecture, tasks & tasks states, priority based scheduling, Semaphore & shared data, timer function, memory management, encapsulating semaphore & queue, hard real-time scheduling consideration, saving memory space & power. Embedded software development process & tools, implementation aspects of embedded systems, validation & debugging of embedded system. [10]

5. **Networks for Embedded system:** 12C two wire busses, the can bus, SHARC link ports, Ethernet, Myrinet, IEEE 1451.1 & IEEE 1451.2 plugs & play standards, embedded TCP/IP. [6]

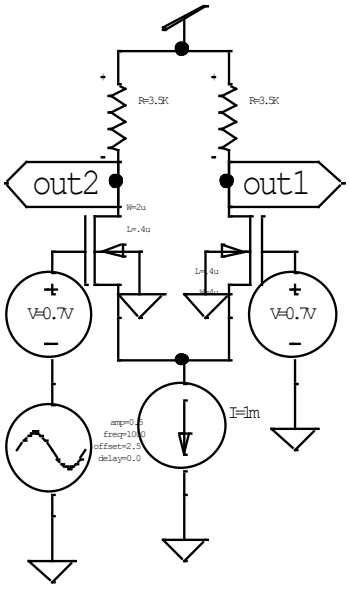
TextBooks:

1. Dreamtech Software Team, Programming for Embedded Systems, Wiley Publishing, Inc., 2003.
2. Mazidi and Mazidi, “The 8051 Microcontroller And Embedded Systems Using Assembly And C”, Pearson Education India.
3. David E. Simon, “An Embedded Software Primer”, Addison-Wesley Professional.

Tool: Tanner EDA

Technology: 0.5µ(sub µ) and .35Tsmc(Deep sub µ)

1. Design CS amplifier with active load(PMOS) having R_L=1KΩ and gain=10.
   Technology= 0.5 submicron
2. Design Amplifier with current mirror. (Active load PMOS)
   $I_{D(ref)}$ = 65µA Technology. = 0.5 sub-micron
   W/L =25
   R_L = 40k
   (a) Plot Vout/Vin.
   (b) Current in driven transistor.
3. Design Amplifier with current mirror(Active load PMOS) and replace resistance by active load transistor
   $I_{D(ref)}$ = 65µA Tech. = 0.5 sub-micron
   W/L =25
   R_L = 40k
   (c) Plot Vout/Vin.
   (d) Current in driven transistor and frequency response of the amplifier by SPICE simulation.
4. (a) Design a common source amplifier with a current mirror active load for gain 20 where all transistors have same W/L.
   (b) Draw small signal equivalent model for given common source amplifier.
   Specification: **rds,n=8000L/I_D(µm/mA), I_D=100µA**
   rds,p=12000L/I_D (µm/mA), Vdd=3.3v, Tech=0.35Tsmc.
5. Design two stage amplifier for gain 100.Load resistance of first stage is 10K and**(W/L)=15** for each transistor another specification will be provide in lab.
   Technology: 0.5 sub-micron.
6. For a Common Source amplifier given that
   Av=40, Rin=180K, C_L=0.3pF,
   rds,n=8000L/I_D(µm/mA), I_D=100µA
   rds,p=12000L/I_D(µm/mA),V_{DD}=3.3v, Cgs1=0.2pF, Cgd1=0.015pF,
   Cdb1=20fF,Cdb2=36fF,
   Tech=0.35Tsmc.
   (a) Estimate the –3db frequency of the common source amplifier.
   (b) Plot frequency response for the CS amplifier by SPICE simulation and estimate -3db frequency.
   (c) Estimate the B.W. by SPICE simulation.
7. **(a)** Draw I-V characteristics of Cascode amplifier and compare with non-cascoded amplifier with following specifications by SPICE:
   RL=500K, (W/L)=5/0.35 of each transistors, Technology:0.35 deep subu
   (b) Draw VTC of both amplifiers.
   (c) Compare the result of (a) with different biasing of bias transistor.
   (d) Draw load current (decreasing order of RL) with output voltage.
   (e) Draw load current with different Vds in decreasing order.
8. In given figure m2 is twice as wide as m1 (W/L)1=20/4, calculate the small signal gain if vin1 and vin2 are equal and compare with spice simulation Iss=1ma, Rd=3.5kΩ, freq=10k.



9. Design cascode current sink using VDD = - VSS = 3.3V. Reference current is 10µA. Determine the peak current deviation and the time it takes the output current to return to its steady state value for the simple current mirror. Reference current is 10µA. Assume the step transition from 0 to 3.3 V.
10. Design and estimate the W/L ratio of the current mirror load differential amplifier. Given Vdd = - Vss = 3.3V.
    Specifications:
    Diff. Voltage Gain = 100V/V
    f_{-3} dB ≥ 100 kHz
    ICMR ≤ 2V
11. Design two stage high gain differential amplifier
    a. plot o/p Vss Vin
    b. Estimate gain with SPICE.
    Specification will be provide in lab.
    Technology=.35Tsmc.
12. Estimate the waveform of Comparator on the basis of two stage high gain amplifierwith reference voltages 0 , 0.4v, 1.2v.
    Technology=.35Tsmc, and other Specification will be provide in lab.
13. Assignment based on operational amplifier design.

EC 574 HDL Programming Laboratory 0-0-4-2

1. Write VHDL code for D flip flop using data style of modeling.
2. Write VHDL code for Mealy FSM using block statement.
3. Design Moore FSM and write VHDL code using behavioral style.
4. Write VHDL code for 4:1 mux using
    a. When else
    b. Select statement
    c. Case statement
5. Write VHDL code for 2:4 decoder using if statement.
6. Write VHDL /Verilog code for full adder.
7. Design full adder using half adders and write VHDL code in structural style of modeling.
8. Design ripple carry adder using full adder and write VHDL /Verilog code.
9. Design package for full adder and half adder using procedure.
10. Design package for 2:1 MUX, 4:1 MUX, 8:1 MUX using function.

HS 501 Technical Communication 2-0-0-2

6. **Process of Communication:** Clarity in pronunciation based on International Phonetic Alphabet and awareness of colloquial expressions. [7]

7. **Composition:** Letter Writing, resume writing, theme development, formats for introducing, instructing, persuading, referencing and summarizing. [7]

8. **Report Writing:** Types of reports and structure of formal reports. [4]

9. **Presentations:** Making presentations and participating in group discussions, importance of sequential presentations. [5]

10. **Miscellaneous:** Analyzing strategies and their correlation with writing patterns and editing information. [5]

Text Books:

4. Gerson S.G., and Gerson S.M., Technical Writing, Pearson Education Asia, 2001.
5. Sharma R.C., and Mohan K., Business Correspondence and Report Writing, Tata McGraw-Hill,13th Ed.,1999.
6. Balasubramanian T., A Textbook of English Phonetics, Macmillan Publication, 2001.

Mody University of Science & Technology, Lakshmangarh (Sikar)

College of Engineering & Technology

Course structure for

PhD

CS 702 **Advances in Computer Science and Engineering** **Total Lectures: 52**
4-0-0-4

Prerequisite(s): Knowledge of core subjects of computer science and engineering.

Objective(s): To strengthen the knowledge of core subjects of computer science and engineering.
To provide research orientation to the students and latest developments in core areas.

1. **Digital Computer Organization and Architecture:** Boolean algebra, Combinational and sequential circuits. Minimization, Number representations and computer arithmetic (fixed and floating point), Machine instructions and addressing modes, ALU, data-path and control unit, Instruction pipelining, memory hierarchy: cache, main memory and secondary storage; I/O interface (interrupt and DMA mode). [10]
2. **Data Structures and Algorithms:** Arrays, stacks, queues, linked lists, trees, binary search, trees, binary heaps, graphs, recursion, searching, sorting, hashing, asymptotic worst case time and space complexity, algorithm design techniques: greedy, dynamic programming and divide-and-conquer, graph search, minimum spanning trees, shortest paths, programming in C. [10]
3. **Theory of computer science and compiler design:** Regular expressions and finite automata, context-free grammars and push-down automata, regular and context-free languages, pumping lemma, Turing machines and undecidability, compiler design: lexical analysis, parsing, syntax-directed translation, runtime environments, intermediate code generation. [10]
4. **Operating System:** Processes, threads, inter-process communication, concurrency and synchronization, deadlock, CPU scheduling, memory management and virtual memory, file systems. [6]
5. **Databases:** ER-model, relational model: relational algebra, tuple calculus, SQL, Integrity constraints, normal forms, file organization, indexing (e.g., B and B+ trees), transactions and concurrency control. [6]
6. **Computer Networks:** Concept of layering. LAN technologies (Ethernet), flow and error control techniques, switching. IPv4/IPv6, routers and routing algorithms (distance vector, link state), TCP/UDP and sockets, congestion control, Application layer protocols (DNS, SMTP, POP, FTP, HTTP), basics of Wi-Fi, network security: authentication, basics of public key and private key cryptography, digital signatures and certificates, firewalls. [10]

Outcome(s): This course supports the achievement of the following outcomes:

1. Ability to apply knowledge of advanced principles of computing to the analysis of computer engineering problems.
2. Ability to apply the appropriate industry practices, emerging technologies, state-of-the-art design techniques, software tools, and research methods for solving engineering problems.
3. Ability to maintain life-long learning and continue to be motivated to learn new subjects.

4. A V Aho, R Sethi, J D Ullman, "Compilers: Principles, Techniques and Tools", Pearson, 2nd edition, 2014.
5. Galvin, Silberschatz, Gagne, "Operating System Concepts", Wiley India, 9th edition, 2015.
6. Navathe, "Fundamentals of Database Systems", Addison Wesley, 5th edition, 2007.
7. Tanenbaum, "Computer Networks", PHI, 4th edition, 2002

EC702 Advances in Electronics & Communication Engineering **Total Lectures:52**

3-1-0-4

Objective: The course focuses on the basic theory and techniques used in the area of digital signal processing, VLSI design, Microwave Engineering, Antenna & Wave Propagation and Digital Data communication. It also offers a profound understanding of the design, analysis and applications of some complex circuits and devices with the help of computer aided simulation and synthesis tool for hardware design.

Prerequisite:
Basic understanding of core engineering courses given in the syllabus, is required.

VLSI Design Technology

MOS modeling and performance parameters, Design aspects: Review of MOS transistor models , Concept of Scaling and deep submicron VLSI design, Low Power VLSI design, Issues related to high speed VLSI Design (CMOS technology), New trends in Digital VLSI design, Example of Mixed VLSI Design, Advanced Testing and Verification Approaches, Wafer cleaning processes and wet chemical etching techniques. Introduction to hardware description languages (VHDL), logic, circuit and layout verification. MEMS **[10]**

Microwave & Radar Engineering

Maxwell's Equation, Wave Equation and Boundary conditions, Transmission lines, Microwave Passive Components, Measurements of Wavelength, Frequency, Impedance, SWR etc., Q of Cavity, Microwave Linear Beam Tubes, Reflex Klystron. Traveling Wave Tube, Transferred Electron Devices, Principle of operation of Radar, Radar equation, CW and Frequency Modulated Radar, MTI and Pulse Doppler Radar **[12]**

Antenna & Wave Propagation

Introduction of Antenna & its parameters. Reciprocity theorem, Review of microwave antennas- Parabolic Reflector, Cassegrain feeds, Horn Antennas, Open-ended wave guides, lens antennas, Dielectric rod Antennas, Antennas for mobile communication. Frequency- independent antennas, Scattering and diffraction. Internal-equation methods, current distribution: Self and mutual impedances. **[10]**

Digital Data Communications

Local Area networks:- token ring, Ethernet, Traditional, Fast and GIGA bit Ethernet, FDDI, DIGITAL MULTIPLEXING :- TDM , T1 carrier , CCITT , CODECS, COMBO CHIPS , North American Hierarchy , Line Encoding , T-carrier , Frame Synchronization Inter Leaving Statistical TDM FDM , Hierarchy ,Wave Division Multiplexing . **[10]**

Signal Processing

Multi-rate Digital Signal Processing: Introduction, Decimation by a Factor D, Interpolation by a Factor I, Sampling Rate Conversion by a Rational Factor I/D, Filter Design and Implementation for sampling rate Conversion. Linear Prediction And Optimum Linear Filters: Forward and backward linear prediction; Properties of the linear prediction – error filters; Applications of linear prediction., Solution of the Normal Equations, Properties of linear prediction-Error Filter, AR Lattice and ARMA Lattice-Ladder Filters. Power Spectral Estimation: Principle and traditional methods of spectral estimation; Modern methods of parametric estimation; Applications of spectral analysis,. **[10]**

Course Outcomes:

This course supports the achievement of the following outcomes:

1. Ability to apply knowledge of advanced principles to the analysis of electrical and computer engineering problems.
2. Ability to apply the appropriate industry practices, emerging technologies, state-of-the-art design techniques, software tools, and research methods for solving engineering problems.
3. Ability to use the appropriate state-of-the-art engineering references and resources, including IEEE research journals and industry publications, needed to find the best solutions to electrical and computer engineering problems.
4. Ability to maintain life-long learning and continue to be motivated to learn new subjects.
5. Ability to be competitive in the engineering job market.

Text books

4. John P. Uyemura : Introduction to VLSI Circuits and Systems, John Wiley & Sons,Inc, 2002
5. Electronic communication systems, fundamentals through advanced - W. TOMASI, Pearson 4th Edition.
6. Introduction to Radar, M. I. Skolnik, McGraw Hill.

Reference books

1. Annapurna das & Sisir K das, Microwave Engineering Tata Mcgraw Hill.
2. Data communication and networking - B.A. Forouzen
3. Kin. Lu. Wong, "Compact and Broadband Microstrip Antenna", John Wiley & Sons
4. S. Stergiopoulos (editor), "Advanced Signal Processing Handbook: Theory and Implementation for Radar, Sonar, and Medical Imaging Real-Time Systems", CRC Press LLC, 2001.
5. Neil Weste and David Harris, "CMOS VLSI Design ", 4thEd., Addison Wesley, 2011.

EE 702 **Advances in Electrical Engineering** **Total Lectures: 52**

4-0-0-4

Objective: To provide an exposure on the basic principles and techniques used in the area of ultra-capacitor, control systems and its sliding modes control, Smart Grid, Renewable Energy Integration. It also offers a profound understanding of the design, analysis and applications of Smart Grid, Renewable Energy integration with the help of computer aided simulation and synthesis tools / ETAP Software.

Pre-requisite: Basic understanding of core engineering courses given in the syllabus is required.

1. **Ultra- Capacitor:** Introduction, History, Basic principles of Ultracapacitors, Principles and energy storage mechanism, EC vs. Aluminum (Al) electrolytic capacitors, Capacitors vs. batteries, Benefits and limitations of Ultracapacitors, Ultracapacitor vs. Flywheels, Applications, Cell voltage, Comparison with battery or other energy storage devices, Cost of EC capacitors, Electrochemical Double Layer Capacitor: basic construction, Components of Ultracapacitor, EC capacitor sizes, Future of energy storage industry, Uninterruptible power supply and backup power. [8]
2. **Applications & Future Scenario of Ultra- Capacitor:** Modern day applications of Ultra capacitor, Future application growth, New material developments, Cost reduction, Ultra capacitor may overtake batteries, Market trends, ultra capacitors in the grid, Vehicular applications, Ultra capacitors in wind turbines, Water Desalination/Purification, New Ultra capacitor work at constant voltage, Electrochemical flow Ultra capacitor, Micro Ultra capacitor, Ultra capacitor for resistance welding. [8]
3. **Advanced control systems :** Introduction, Intuitive theory of sliding mode control, Sliding Surface, sliding mode, concept of equivalent control, sliding mode equations, sliding mode observer/differentiator, second order sliding mode. [7]
4. **Classical sliding modes:** Introduction, state feedback sliding mode control: Regular form, Eigen valve placement, quadratic minimization. State feedback control laws design: Single input system, multi-input system, unmatched uncertainty, output tracking with integral action. Output based hyper plane design, control law development. Integral sliding mode control: Problem formulations, control design objective, ISM control design. [8]
5. **Smart Grid:** Introduction, Characteristics of Smart Grid, Traditional Grid Versus Smart Grid, Evolution of Smart Grid, Components of Smart Grid, The Environmental Impacts of Smart Grid, Technologies Required for Smart Grid. [8]
6. **Renewable Energy Integration:** Introduction, Solar Energy, Wind Energy, Distributed Energy Resources Integration Challenges, Forecasting and Scheduling, Impacts of Renewable Energy into the Grid. [8]
7. **Smart Meter:** Details Description of Smart Meter, Benefits of Smart Meter, Technical Configurations of Smart Meter, Components of Smart Meter Network in Distribution System, Characteristics, Communication Protocols. [5]

Course Outcomes: This course helps our students to apply the knowledge of advanced principles, state of -the-art design techniques, software tools, and research methods for solving challenges of Smart Grid, Renewable Energy Integration and ultra capacitor.

Text Books:

1. R. P. Deshpande, "Ultra -capacitors: Future of Energy Storage", Mc-Graw Hill Education.
2. C-Edwards & S.K. Spurgeon, "Sliding mode control: Theory & Application", Taylor & Francis, 1998.

3. Shawkat Ali A. B. M., Smart Grids Opportunities, Developments and Trends, Springer-Verlag, London , 2013

Reference Books:

1. B. E. Conway, "Electrochemical Super capacitors: Scientific Fundamentals and Technological Applications", Kluwer Academic / Plenum Publishers (1999)
2. Utkin V.I., "Sliding modes in control & optimization", Springer-verlay, 1992.
3. Momoh James., Smart Grid Fundamentals of Design and Analysis, John Wiley &Sons, Inc., Hoboken, New Jersey, 2012

ET 901 **Research Methodology** **4-0-0-4**

1. **Introduction:** meaning of research, objectives, motivation for research, types of research, research approaches, research process, validity and reliability in research. [02]

2. **Problem formulation:** identification, selection & formulation of a research problem, objectives of formulation, criteria of a good research problem, review of literature. [03]

3. **Research design:** research framework, meaning & significance of research designs, features of a good research design, types of research design. [04]

4. Data for research: types of data, sources of data, methods of collecting data, data presentation techniques. Methods of data analysis. [10]
*Use of SPSS and MATLAB tools for data analysis.

5. **Mathematical background for research:** approaches to probability, probability distributions; binomial, Poisson, uniform, exponential and normal distributions. Review of basic statistical measures; measures of central tendency, measures of variation. Sampling methods, correlation analysis, simple regression, multiple regression, time series analysis, cluster analysis, clustering techniques. Queuing theory; introduction, simple Markovian queuing models. [10]

6. **Algorithmic Research:** introduction, types of algorithmic research problems, types of solution procedures, steps of development of algorithm. [04]

7. **Simulation:** introduction, need for simulation, simulation analysis of a case study. [03]

8. **Thesis writing:** format; general format of cover page, dedication, certificate, declaration, acknowledgement, abstract, list of contents, list of figures, list of tables, appendices, and references. Contents of thesis; background to research, literature review, problem statement, objectives of research, rationale for the study, motivation to the study, methods, definitions, research models, research design & analysis, results, findings, implications, contributions, significance of research, future directions, and conclusion. [04]
*Practical classes to be taken.

Reference Books.

1. Mr. R. Pannershelvam, "Research Methodology", Prentice Hall India, 2006.
2. Mr. C. R. Kothari, "Research Methodology : Methods and Techniques", Second edition, New Age International Publishers, 2006.
3. Mr. Ranjit Kumar, “Research Methodology: A step by step guide for beginners” , Second edition, Pearson, 2006

ME 702 **Advances in Mechanical Engineering** **Total Lectures: 52**

Credit: 4-0-0-4

Prerequisite(s): M.Tech./M.E. or equivalent degree in Mechanical Engineering, Production Engineering, Industrial Engineering, Metallurgical Engineering and knowledge of core subjects in these stream.

Objective(s):

- *To strengthen the knowledge of core subjects of mechanical engineering.*
- *To provide research orientation to the students and latest developments in core areas.*

1. Advanced Theory of Elasticity (3-dimensional problems): **[10]**

Theories of Stress and strain, Transformation of stress and strain, Linear stress-strain temperature relations, Applications of energy methods, Torsion (Narrow rectangular cross Section, Hollow thin wall torsion members) Bending (Unsymmetrical bending, Curved beam**),** Plates.

2. Experimental Stress Analysis: **[6]**

Strain Measurement Methods: Various types of strain gauges, Electrical Resistance strain gauges, semiconductor strain gauges, strain gauge circuits

3. Advances in Production & Industrial Engineering : **[10]**

Friction, Explosive welding, under water welding, Methods of measuring welding defects by Radiographs, Ultrasonic flow detector and metallurgical analysis to prevent-premature failure. Atomic emission spectrometer, Residual stress analysis in Welding, Solid Phase Welding and Cold Pressure welding. Full mould casting, Continuous Casting, Shape Casting, Casting Defects, Solidification process in casting. Metal cutting principles & design of machine tools, Conversion of cutting tool nomenclature, Thin and thick zone model. Trends towards development of new metal cutting processes including dry machining and environmentally conscious machining.

ERP and Supply Chain Management (ERPSCM), the emergence and need for ERP concept; Modules and Architectures of a typical ERP System, Selection and implementation of ERP Systems; **[6]**

4. Introduction to Optimization Techniques: **[6]**

Engineering application of Optimization, Formulation of design problems as mathematical programming problems, classification of optimization problems.

5. Advance Thermodynamics **[6]**

Thermodynamics Relations:- Mathematical theorems, Maxwell relations, T-ds equations, Energy Equations, General Relations involving internal energy, enthalpy & entropy, Thermodynamics Relations involving specific heat , Clapeyron equation, Joule Thomson Coefficient,

6. Convective Heat Transfer: Introduction to convection, review of conservation equations - Forced convection in laminar flow - Exact and approximate solutions of Boundary layer energy equation for plane isothermal plate in longitudinal flow - problems. **[8]**

Forced convection heat transfer in laminar tube flow - forced convection in turbulent flow – Internal Flows-Correlations-Problems

Outcome(s): *This course supports the achievement of the following outcomes*

- *Current trends in the rapidly evolving field*
- *The intellectual and philosophical framework necessary to explore wide spectrum of research in mechanical engineering.*
- *To contribute to expanding the frontiers of knowledge and to provide research training.*
- *Ability to apply the appropriate industry practices, emerging technologies, state-of-the-art design techniques, and research methods for solving engineering problems*

NT-702 Advances in Nanoscience and Technology Total 52 lectures
3-1-0-4

Objective: The course focuses on the basic theory and techniques used in the area of nano Science & Technology. The paper covers important areas and gives profound understanding about nano world, synthesis of nano materials, various characterization techniques for nano materials and applications of nano Science & technology in the area of modern electronics, medical sciences and environmental sciences. It may guide and help the student in deciding about the research area in which he/ she may like to contribute further.

Pre-requisite:
Basic understanding of core science and engineering courses given in the syllabus

Course Outcomes:

This course supports the achievement of the following outcomes:

1. Ability to apply knowledge of advanced principles to the analysis of nano science & technological problems.
2. Ability to apply the appropriate industry practices, emerging technologies, state-of-the-art design techniques, software tools, and research methods for solving engineering problems
3. Ability to use the appropriate state-of-the-art engineering references and resources, including IEEE research journals and industry publications, needed to find the best solutions to nano science & technology problems.
4. Ability to maintain life-long learning and continue to be motivated to learn new subjects.
5. Ability to be competitive in the innovative research areas and relevant job market.

Syllabus details

1. Nano World : [12]

Introduction, History of nanomaterials, what is nano? Beginning of Nanoscience, Moore,s law, Nanoscience: The multidisciplinary science, Different types of nanomaterials, Properties of nanomaterials, Zero dimensional, one-dimensional and two dimensional nanostructures-clusters of metals and semiconductors, nanwires, Size dependent properties-size dependent absorption spectra-phonons in nanostructures, seeing nano-objects

2. Synthesis of Nanomaterials: [16]

Physical Methods: Top-down and bottom-up approach, Inert gas condensation, Arc discharge, RF-plasma, Plasma arc technique, Ion sputtering, Laser ablation, Laser pyrolysis, Ball Milling, Molecular beam epitaxial, Chemical vapour deposition method and other variants, Electro deposition.

Chemical Methods: Chemical reduction method, Sol- gel, Micelles and microemulsions, Solvothermal synthesis, hydrothermal methods, photochemical synthesis, electrochemical synthesis, Thermolysis routes, Sonochemical routes, Liquid-liquid interface, Self-assembly, self-assembled monolayers (SAMs). Langmuir-Blodgett (LB) films, clusters, colloids, zeolites, template synthesis, organic block copolymers, porous silicon, and Pulsed electrochemical deposition. Nanoporous Materials, Silicon, Zeolites, mesoporous materials, nanomembranes and carbon nanotubes, AgX photography, smart sunglasses, and transparent conducting oxides, molecular sieves, nanosponges.

Biological Methods of Synthesis: Use of bacteria, fungi, Actinomycetes for nanoparticle synthesis, Magnetotactic bacteria for natural synthesis of magnetic nanoparticles; Mechanism of formation; Viruses as components for the formation of nanostructured materials; Synthesis process and application, Role of plants in nanoparticle synthesis

3. Characterization Techniques : [12]

X-ray diffraction, Scanning Probe Microscopy, SEM, TEM, Optical microscope and their description, operational principle and application for analysis of nanomaterials, UV-VIS-IR Spectrophotometers, Principle of operation and application for band gap measurements, Magnetic and electrical measurements. Lithographic Techniques: AFM based nanolithography and nanomanipulation, E beam lithography and SEM based nanolithography and nanomanipulation, Ion beam lithography, oxidation and metallization. Mask and its application. Deep UV lithography, X-ray based lithography

4. Applications of Nanomaterials: [12]

Electronic Applications:

Applications of nano for IC chips, STM based lithography-Molecular electronics- LEDs- Memories – CNT and Graphene based Electronic devices - transistor based sensors and its general applications- Applications of Nanomaterials in Space

Applications of Nanomagnetic materials

Nanomagnetism- Bionanomagnetism- type of magnet materials –tag and drag drug delivery – hyperthermia- hypothermia-MRI

Environmental Applications:

Bioremediation- removal of bacteria and microbes- sensors for DNA- Proteins, and Biological applications – self assembly systems- tissue culture- nanopharma

Text Books:

1. Nanoworld: An introduction to Nanoscience and technology – C N R Rao
2. A Textbook of Nanoscience and Technology: T. Pradeep
3. Nano: The Essentials-T. Pradeep
4. Introduction to Nanotechnology, Wiley, Charles P. Poole Jr. & Frank J. Owens
5. Lehninger Principles of Biochemistry, Sixth Edition, Nelson and Cox, W.H. Freeman and Company

References:

1. Physical Chemistry: Gilbert W. Castellan
2. Physical Chemistry of Surfaces: Authur W. Adamson, Alice P. Gast
3. The Chemistry of Nanomaterials: Synthesis, Properties and Applications, C. N. R. Rao, Achim Müller, A. K. Cheetham, Wiley
4. NANO: The Next Generation-Mohan Sundar Rajan, National Book Trust, India

***Theory:** Assignments and regularity will be evaluated out of 10 (ten) marks in a semester.
Practical: Practical record and regularity will be evaluated based on Viva/quizzes 4 (four) times in a semester. Each evaluation will be out of 10 (ten) marks.

**** Theory:** Two mid-term examinations of 20 (twenty) marks each.
†Evaluation of proficiency will be based on the participation in co-curricular activities.
†† Students will go for an industrial training program of 8 (eight) weeks in the summer after the end of the III year spring semester examination.

B. Tech. Electrical Engineering

Four Year B. Tech. Programme

Academic Curriculum (2015-16 onwards)

List of Technical Electives

III Year Spring Semester (Industrial Elective)

S. No.	Course Code	Course Title
1.	EC-15.312	Advanced Radio Access Network (ARAN)
2.	EE-14.305	Power Plant Engineering
3.	EE-14.310	Reliability of Electrical Power System

List of Technical Electives

IV Year Autumn Semester (Elective -I)

S. No.	Course Code	Course Title
1.	EE-14.411	Smart Grid
2.	EE-14.413	Modern Control System
3.	EE-14.415	Power Quality
4.	EC-14.413	FPGA Architecture and Applications
5.	EE-14.404	Renewable Energy Systems

IV Year Spring Semester (Elective -II)

S. No.	Course Code	Course Title
1.	EC-14.306	Microcontrollers & Embedded Systems
2.	EE-14.412	EHV AC & DC Transmission
3.	EE-14.414	Computer Applications in Power system
4.	CS-14.305	Logic in Computer Science

EE-14.201 **Network Analysis & Synthesis** **Total Lectures: 40**
3-1-0-4

Objective: This course helps in analysis of A.C & D.C circuits and it also help to design the circuit models for the minor and major projects.

Prerequisite: Knowledge of Laplace transformation

1. **Development of Circuit Concept:** Introduction, capacitance, inductance and resistance parameters, approximation of a physical system as a circuit, reference directions for current and voltage, voltage and current sources, active element conventions, dot convention for coupled circuits, topological description of networks, linear graphs of a network and its parts, loops and trees, incidence matrix, cut-set matrix and tie-set matrix. [8]
2. **Network Equations**: Kirchhoff's laws, minimum number of network equations, source transformations, formulation of network equations, loop variable analysis &node variable analysis and duality. [6]
3. **Analysis of RLC Circuits**: Laplace transformation, some basic theorems for the Laplace transformation, transient response of RL, RC and RLC circuits using Laplace transform with D.C input and A.C. with sinusoidal input, partial fraction expansion, and solution of problems by Laplace transformation. [8]
4. **Network Theorems**: Superposition and reciprocity theorems, Thevenin and Norton theorems, Millman theorem, Tellegen theorem, and maximum power transfer theorem, application of these theorems to networks with a.c and d.c excitation. [8]
5. **Two Port Network**: Two port parameters, impedance, admittance, hybrid, inverse hybrid, transmission parameters, relationship between various parameters, reciprocity and symmetry of two port network, inter connection of two port networks. [6]
6. **Synthesis of Passive Network**: Hurwitz polynomials, positive real functions, elementary synthesis procedures, properties of LC immittance function, synthesis of LC driving point immittance, properties of RC driving point impedances, synthesis of RC impedances or RL admittances, properties of RL impedances and RC admittances, synthesis of RLC functions. [6]

Course Outcome: Upon successful completion of this course, students should be able to:

- Gain fundamental knowledge of the basic electrical elements such as resistance, capacitors and inductances.
- Understand circuit representation as graphs and implementation of KVL and KCL in the circuits and to solve the circuit problems by Laplace transformation method and also by applying various networks theorems.
- Analyze small RLC circuits by hand. Use network techniques, like node analysis and loop analysis, to write equations for large linear circuits.
- Apply Thevenin and Norton theorems and concept of linearity and superposition to analyze and design circuits and networks.

Text Books:

1. M. E. Van Valkenberg, "Introduction to Modern Network Synthesis", Pearson, 3rd Edition, 2016.
2. A. Chakrabarti, "Circuit Theory – Analysis and Synthesis", Dhanpat Rai & Co., 6th Edition, 2010.

Reference Books:

1. A. Sudhakar and S. P. Shyam Mohan, "Circuits and Network Analysis and Synthesis", McGraw-Hill, 5th Edition, 2015.
2. W. H. Hyatt Jr. and J. E. Kemmerly, "Engineering Circuits Analysis", McGraw-Hill, 7th edition, 2010.

EE-14.203 **Electrical Machines-I** **Total Lectures: 43**

3-1-0-4

Objective: This course facilitates the students to get a comprehensive exposure to the working principles, construction details and performance of D.C machines and Transformer.

Pre-requisite: Electrical Engineering course of First Year.

1. **Basic Concepts of Electrical Machines:** Introduction, Electromagnetic induction, flux linkage, statistically and dynamically induced emf, Classification and description of electrical machines, Heating and cooling of electrical machines. [4]
2. **Elements of Rotating Machines**: Introduction, Basic Components, Rotor, Stator and field excitation. Generator and motor action, EMF and torque equations, Leakage flux, Losses and efficiency, Rating and loss dissipation, Electrical and mechanical degrees. [5]
3. **Introduction to D.C. Machines:** Constructional parts of d.c. machines and their function, Principle of operation, Armature winding- Lap and wave, Simplex and duplex, Method of excitation, Classification, Derivation of emf and torque equations, Process of commutation, Armature reaction, Interpoles, Compensating winding and equalizer rings. [6]
4. **D.C. Generator**: Operating characteristics- Magnetization, Internal and external characteristics, Critical resistance and critical speed, Process of building up of voltage, Causes of failure of voltage build-up and remedies, Parallel operation of d.c. generators, Applications. [6]
5. **D.C. Motor**: Basic equation for voltage, Power, Torque and speed, Condition for maximum power, Operating characteristics- Torque-current, Speed-current and Torque-speed characteristics. Comparison, Starters, Speed control methods, testing of d.c. machines-Swinburne, Hopkinson's and Series field tests. Calculation of efficiency, Applications. [6]
6. **Transformers**: Principle of operation, Construction and practical considerations, Ideal and physical transformer, emf equation, Transformation ratio, Phasor diagram. Performance analysis, Equivalent circuit, Losses and efficiency, Condition for maximum efficiency, Determination of equivalent circuit parameters by O.C. and S.C. tests, Per unit calculation, Polarity test, Voltage regulation, All day efficiency. [10]
7. **Transformer Connections and Operation**: Back-to-back test, Parallel operation, Autotransformer, 3-phase transformer, Vector group, Three-phase transformer connections- Star-star, Delta-delta, Star-delta, Delta-star, Zig-zag connections, Scott connection, Open delta connection, Transformer cooling. [6]

Outcome: Graduates will have the knowledge of DC Electric motor, DC Generator and Transformer. They will understand how these motors are operated for applications.

Text Books:

1. D.P. Kothari and I.J. Nagrath,. "Electric Machines", McGraw-Hill, 2nd Edition, 2004.
2. P.S. Bimbhra, "Electrical Machinery", Khanna Publishers, 5th Edition, 2013.

Reference Books:

1. A.E. Fitzgerald, Charles Kingsley and Stephen D.U Electric Machinery, Mc Graw-Hill, 2nd Edition, 2003.
2. J.B. Gupta, Theory and Performance of Electrical Machines, S.K. Kataria and Sons, 3rd Edition, 2002.

MA-14.201 **Applied Mathematics** **Total Lecture: 40**

3-1-0-4

Objective: To acquire fundamental knowledge of linear programming, numerical methods, complex analysis and integral transform and apply in engineering disciplines.

Pre-requisite: Engineering Mathematics

1. **Linear Programming:** Introduction**,** Graphical method (bounded &unbounded solutions); Simplex method, Artificial variable technique (Two phase method, Big –M method); Assignment problem (Hungarian method); Transportation problem (Vogel's approximation method). **[12]**

2. **Numerical Methods:** Solution of system of equations (Gauss elimination and Gauss - Seidel methods);Solution of algebraic and transcendental equations (Bisection, Ramanujan's and Regula Falsi methods); Solution of ordinary differential equation (Euler's modified, Milne's predictor & corrector Runge-Kutta methods). **[10]**

3. **Complex Analysis:** Function of complex variable, analytic function, Cauchy-Riemann equations(without proof), integration of complex functions, line integrals in the complex plane, Cauchy integral theorem(without proof), Cauchy integral formula(without proof), zeros and singularities of complex functions, residues. **[6]**

4. **Integral Transform**: Laplace transform and inverse Laplace transform, First and Second Shifting theorems, Convolution theorem (without proof), Solution of ordinary differential equations with initial conditions by Laplace transforms. Fourier series of periodic functions, even and odd functions, Fourier half-range series; Basics of Fourier transforms. **[12]**

Outcome: After completion of the course, students would be able to apply the knowledge of linear programming, numerical methods, complex analysis and integral transforms in engineering and solve curriculum problems.

Text Books:

1. Ramana B.V., "Higher Engineering Mathematics", McGraw Hill, 1st Edition, 2006.
2. Grewal B.S. & Grewal J.S., "Higher Engineering Mathematics", Khanna publishers, 39th Edition, 2005.

Reference Books:

1. Jain R.K. & S.R.K. Iyenger Advanced Engineering Mathematics, Narosa Publishing House, 2nd Edition, 2003.
2. Erwin Kreyszig Advanced Engineering Mathematics, 9th Edition, Reprint 2011.
3. Taha H.A., "Operation Research: An Introduction", Pearson, 10th Edition, 2016.
4. Sastry S.S., "Introductory Methods of Numerical Analysis", PHI, 5th Edition, 2012.

EC-14.201 **Electronic Devices and Circuits** **Total Lectures: 40**

3-1-0-4

Objective: To acquire fundamental knowledge of operation, design and application of various Electronic devices and circuits.

Prerequisite: Basic Electronics and Physics of electron.

1. **Junction Diode:** Junction breakdown**,** Current components in a p-n diode, Quantitative analysis of p-n diode characteristics and equivalent circuit, diode resistance, interconnections of diodes, transition and diffusion capacitance. [6]
2. **Transistors**: Operation of transistor, transistor current components, transistor circuit configurations, transistor biasing schemes and operating point stabilization, hybrid-pi model of BJT, low and high frequency models of JFET, MOS Devices - NMOS, PMOS and CMOS [11]
3. **Small Signal Amplifiers at Low Frequency:** Coupling schemes for multistage amplifiers, frequency response of coupled amplifier, RC coupled transistor amplifier, transformer coupled transistor amplifier, cascode circuits, Differential amplifier, Darlington amplifier. [7]
4. **Power Amplifiers:** Power amplifier circuits, class-A, class-B, class-AB, class-C, push pull amplifiers- class-A, class-B, Class- AB, complementary symmetry push-pull and quasi-complementary symmetry, push-pull amplifiers. [8]
5. **Oscillators:** Classification criterion for oscillation, tuned collector, Hartley, Colpitts, RC phase shift, Wien bridge and crystal oscillators, astable, monostable and bistable multivibrators, Schmitt trigger. [8]

Outcome: After completion of this course, students would be able to understand the working phenomena and applications of various electronic devices and circuits. Knowledge gained from this course would also be utilized to design different electronic circuits and devices.

Text Books:

1. Millman J. & Halkias C.C., "Electronic Devices and Circuits" McGraw Hill, 2nd Edition, 2010.
2. Thomas L. Floyd, "Electronic Devices", Pearson Education 9th Edition, 2013.

2. Robert L. Boylestad & Louis Nashelsky, "Electronic Devices and Circuit Theory", Pearson Education, 9th Edition, 2009.

EE-14.221 Network Analysis & Synthesis Laboratory

0-0-2-1

Objective: This Lab course helps us to gain basic knowledge of principle, operation, application and design/verification of various Electrical components /devices/ circuits/theorems by conducting the experiments.

Prerequisite: EEE Workshop

1. To study the series and parallel connected resistive circuits.
2. To study the equivalent star of a delta connected resistive circuit and also the equivalent delta of a star connected resistive circuit.
3. To verify the Kirchhoff's current Law and Kirchhoff Voltage law.
4. To verify the superposition theorem using resistive circuit.
5. To verify the Reciprocity Theorem using resistive circuit.
6. To verify the Thevenin Theorem using resistive circuit.
7. To verify of Norton's Theorem using resistive circuit.
8. To verify of Maximum Power Transfer Theorem using resistive circuit.
9. To determine Z-parameter, Y-parameter and ABCD parameter of a given Two-port network.
10. To design a zero PCB for a given circuit to verify the Thevenin Theorem.
11. To find out the time- constant of RL-series circuit when connected to step function.
12. To find out the time constant of RC-series circuit when connected to step function.

Outcome: After completion of this lab course, students would be able to demonstrate the working phenomena and applications of various electrical components and circuits. Knowledge gained from this course would also be utilized in designing different electrical circuits/theorems and devices.

Text Books:

1. M. E. Van Valkenberg, "Introduction to Modern Network Synthesis", Pearson, 3rd Edition, 2016.
2. A. Chakrabarti, "Circuit Theory – Analysis and Synthesis", Dhanpat Rai & Co., 6th Edition, 2010.

Reference Book: Lab Manual.

EE-14.223 **Electrical Machines-I Laboratory**

0-0-2-1

Objective: The objective of the Electrical Machine Lab is to provide an exposure of operation of D.C. machines and transformers and give them experimental skill. It also aims to understand the generation of D.C. voltages by using shunt generator and study their performance. It also enables the students to understand the working principles of D.C. motors and their load characteristics and methods of speed control. It also enables students to test and performance of d.c. machines and transformers.

Prerequisite: EEE Lab

1. To conduct the open circuit and short circuit tests on the given single phase transformer and to pre-determine (i) equivalent circuit parameters (ii) voltage regulation and (iii) efficiency.
2. To connect the given three, single phase transformers as three phase bank in (i) star-star (ii) star-delta (iii) delta-delta and (iv) delta-star configurations.
3. To perform the no-load test on the given D.C. shunt motor to study its speed variation by (i) field control method and (ii) armature voltage control method.
4. To obtain the open citcuit characteristics of a separately excited D.C. generator at rated speed and to determine (i) critical field resistance at rated speed (ii) critical speed (iii) voltage built up by the generator at rated speed and (iv) to plot the O.C.C. at different speeds.
5. To conduct the load test on the given D.C. shunt generator and its internal and external characteristics.
6. To determine the no load losses and hence to predetermine the efficiency, at any desired load, of the d.c. machine running. (i) as a motor and (ii) as a generator
7. To conduct the polarity test on the given transformer and to operate two single phase transformers in parallel to share a common load.
8. To determine the efficiency of two identical d.c. shunt machines by Hopkinson's regenerative test.
9. To conduct the back-to-back test on the given two, identical single phase transformers and to pre-determine (i) equivalent circuit parameters (ii) voltage regulation and (iii) efficiency.
10. To connect the given two, single phase transformers in Scott connection so as to
    (i) Show that the secondary voltages are at right angles to each other
    (ii) Supply two phase load from three-phase supply.
11. To conduct:
    (i) Field's test on two similar mechanically coupled series machines.
    (ii) Compute efficiency at different outputs.

    Plot the following curves for the motor efficiency, torque and speed v/s output.
12. To determine the no load stray losses of a given d.c. shunt machine and to separate the mechanical losses from iron losses.

Outcome: Students will be convergent with transformer and d.c. machines and their testing and performance aspects.

Text Books:
1. J.B. Gupta, Theory and Performance of Electrical Machines, S.K. Kataria and Sons, 3rd Edition, 2002

EC-14.221 **Electronics Devices and Circuit Laboratory**

0-0-2-1

Objective To acquire fundamental knowledge of operation, design and application of various Electronic devices and circuits by doing the experiments.

Prerequisite Electronic Workshop

1. To plot the diode characteristics and its dynamic resistance and cut-in Voltage.
2. Plot the characteristics of a Zener diode and find its dynamic resistance under reverse biased condition. Plot the Line-Regulation and Load-Regulation curve using Zener diode.
3. (a) To implement a diode clipper circuit which clips the positive peak of the input voltage (i) By 1V and (ii) By 3V? (For given sinusoidal input$V_{pp} = 4V, 1kH$).
   (b) To implement a diode clipper circuit which clips the negative peak of the input voltage (i) By 1.5V and (ii) By 2.5V.(For given sinusoidal input $V_{pp} = 4V, 1kH$).
4. (a) To implement a diode clamper circuit which clamps the positive peak of the input voltage to (i) zero reference voltage and (ii) a given voltage $1V$. (For given square wave input$V_{pp} = 10V, 1kH$).
   (b) To implement a diode clamper circuit which clamps the negative peak of the input voltage to (i) zero reference voltage and (ii) a given voltage 1.5V.(For given square wave input $V_{pp} = 10\,V, 1\,kH$.
5. To plot the frequency response of a emitter follower. (For given sinusoidal input $V_{pp} = 3V, 1kH$.
6. Design a Half Wave Rectifier circuit with and without capacitor filter, measure the rms and Dc values of output voltage and calculate the ripple factor for given sinusoidal input $V_{pp} = 10V\,, 1\,kH$.
7. To plot the input and output characteristics of a transistor in CE Configuration.
8. Design a two stage RC coupled transistor amplifier and calculate the gain. (for given sinusoidal input $V_{pp} = 200\,mV, 1\,kHz$).
9. To plot the characteristics of a UJT and find its peak voltage, peak current and valley voltage. Design a relaxation oscillator determine the frequency of oscillation and compare the practical frequency obtained with the theoretical frequency.
10. To plot the Transfer characteristics (for $V_{DS} = 5V$) and Drain (for $V_{GS} = -1V$) characteristics of a JFET in CS Configuration.

Outcome:

After completion of this lab course, students would be able to demonstrate the working phenomena and applications of various electronic devices and circuits. Knowledge gained from this course would also be utilized to design different electronic circuits and devices.

Text Books:
1. Millman J. & Halkias C.C., "Electronic Devices and Circuits" McGraw Hill, 2nd Edition, 2010.

Reference Book:
1. Lab Manual

CS -14.205 **C++ Programming** **Total Lectures: 40**
3-0-0-3

Objective: The objectives of the course is:

- To get a basic knowledge of object-oriented concepts.
- To master in programming related to classes inheritance using C++.

Prerequisite: CS-14.101,CS-14.111

1. **Object Oriented Programming:** Basic concepts of object-oriented programming, Structured versus object oriented programming, merits and demerits of object oriented methodology. **[5]**
2. **Beginning With C++:** Preprocessor directives, Variables, data types, constants, operators, scope resolution operator, memory management operators, decision and loop controls, arrays, strings, functions. **[5]**
3. **Classes And Objects:** Class definition, Structure versus class, accessing member functions within a class, data hiding, arrays within a class, static data and member functions, objects, friend functions and friend classes, constant member functions, pointers to members, constructors and destructor. **[7]**
4. **Overloading and Exception Handling:** Definition, unary operator overloading, binary operators overloading, overloading of new and delete operators, manipulation of string using operators, type conversion, overloading with friend functions, function overloading, error and exception handling. **[8]**
5. **Inheritance and Overriding:** Derived and base classes, type of inheritance, Derived class constructors and destructor, overriding member functions, public and private inheritance, virtual base classes, abstract classes, this pointer, virtual functions and pure virtual functions, static and dynamic bindings. **[8]**
6. **I/O Streams and The Standard Library:** Header files, I/O stream library, stream I/O for objects, File I/O **[4]**
7. **Templates:** Class templates, function templates, overloaded function templates, member function templates. **[3]**

Outcomes: On completion of the course, student should be able:

- To gain the basic knowledge on object oriented concepts.
- To understand the role of inheritance, polymorphism, dynamic binding and generic structures in building reusable code.
- To implement features of object oriented programming to solve real world problems.

Text Books

1. Herbert Schildt, "C++: The Complete Reference"4th edition, McGraw Hill , 1994.
2. Robert Lafore, "Object-Oriented Programming in C++", 4th edition, SAMS, 2001.

Reference Books:

1. Bjarne Stroustrup,"Programming-Principles and Practice Using C++", Addison-Wesley, 5th Edition, 2014.
2. E. Balagurusamy,"Object Oriented Programming With C++",4thedition, McGraw Hill, 4th Edition, 2008.

EE-14.202 **Electrical Machines-II** **Total Lectures: 42**

3-1-0-4

Objective: This course facilitates the students to get a comprehensive exposure to the working principles, construction and performance of A.C machines and synchronous machines.

Pre-requisite: Electrical Machine-I

1. **Basic Concept of A.C. Rotating Machines:** Introduction to Armature winding, Integral slot and fractional slot winding, Distribution factor (K_d), Pitch factor (K_p) and winding factor (K_w). Production of rotating magnetic field, EMF and torque equations, Effect of tooth harmonics and methods of reduction. [4]
2. **Synchronous Generator:** Construction, Cylindrical rotor and salient pole rotor, Principle of operation, Excitation system, Effect of winding factor on EMF, Armature reaction, Circuit model, Phasor diagram, O.C. and S.C. tests, Short-circuit ratio, Determination of voltage regulation by synchronous impedance, MMF and zero power factor methods. [7]
3. **Performance Characteristics of Synchronous Generator:** Two reaction theory, Phasor diagram, Power-angle characteristic of synchronous generators, Synchronizing power and torque, Synchronizing methods, Parallel operation of synchronous generator, Effect of change in excitation and mechanical power input on load sharing, Operation of alternator on infinite bus bars, Slip test. [6]
4. **Synchronous Motor:** Construction, Principle of operation, Equivalent circuit, Phasor diagram, Circuit model, Effect of change in excitation on armature current and power factor, Starting of synchronous motor, Synchronous condenser, Hunting, Applications. [6]
5. **Induction Motor:** Introduction, Construction, Principle of operation, Slip and rotor frequency, Comparison with transformer, Equivalent circuit model, Representation of mechanical load, No load and blocked rotor tests. Torque and power output, Losses and efficiency, Separation of losses. [7]
6. **Performance Characteristics of Three-Phase Induction Motor:** Circle Diagram, Torque-slip characteristics, Effect of rotor resistance, Starting torque and maximum torque, Starting and speed control methods, Cogging and crawling, Introduction to induction generator, Applications. [6]
7. **Single-Phase Induction Motor & special machines:** Introduction, Double revolving field theory, Cross field theory, Torque-speed characteristic, Equivalent circuit model, Starting methods, Applications, Stepper Motor, and Reluctance motor. [6]

Outcome: The students shall develop an insightful knowledge on various ac motors and ac generators.

Text Books:

1. D.P. Kothari and I.J. Nagrath,. "Electric Machines", McGraw-Hill,2nd Edition, 2004
2. P.S. Bimbhra, "Electrical Machinery", Khanna Publishers, 5th Edition, 2013.

Reference Books:

1. A.E. Fitzgerald, Charles Kingsley and Stephen D.U Electric Machinery, Mc Graw-Hill, 2nd Edition, 2003.
2. J.B. Gupta, Theory and Performance of Electrical Machines, S.K. Kataria and Sons, 3rd Edition, 2002

EE-14.204 Electrical Measurement and Instrumentation Total Lectures: 40

3-0-0-3

Objective: To make students conversant with concepts of measurement and various electrical and electronics instruments, transducers and bridges.

Pre-requisite: Basic Electrical engineering, Basic Electronics Engineering

1. **Concepts of Measurements:** Introduction, accuracy and precision, repeatability, errors in measurement, sources of errors, types of errors, statistical analysis of measurement data, graphical representation of measurement, data as distributions, Gaussian graph and precision indices. [6]
2. **Analog Instruments:** Types of operating torques in an analog instrument, Moving coil, moving iron, electrodynamic and induction instruments-construction, operation, torque equation and errors. Shunts and multipliers. Applications of instruments for measurement of single-phase power and single-phase energy. Errors in wattmeter and energy meter and their compensation and adjustment. [6]
3. **Bridge:** DC bridges for measurement of resistance Wheatstone bridges, Kelvin's double bridges and AC bridges for measurement of L, R, C & M, Maxwell's bridges, Anderson's bridges, Weins bridges. [6]
4. **Electronic Instruments for Measuring Basic Parameters:** Electronic Voltmeter, Electronic Multimeters, Digital Voltmeter, Q meter, Vector Impedance meter, signal analyzers- wave analyzers, harmonic distortion analyzers and spectrum analyzers. [6]
5. **Potentiometers:** DC and AC potentiometers, Principles, Standardization and application. [5]
6. **Transducers:** Introduction , Classification, Selection Criteria, Characteristics, Construction, Working Principles and applications of following Transducers- RTD, Thermocouples, Thermistors, LVDT, RVDT, Strain Gauges, Tacho-generators, Piezoelectric Transducers, Ultrasonic Flow Meters. [6]
7. **Oscilloscopes:** CRT Construction, Basic CRO circuits, CRO Probes, Oscilloscope Techniques of Measurement of frequency, Phase Angle and Time Delay. [5]

Outcome: Students will be able to understand electrical and electronic measuring devices and instrumentation like bridges, transducers, CRO etc.

Text Books:

1. Albert D. Helfrick, Wiliam D. Cooper, "Modern Electronic Instrumentation and Measurement Techniques", PHI Learning Private Limited, 2011.

3. A.J. Bouwens, 'Digital Instrumentation', McGraw Hil, 2nd Edition, 2002.
4. E.O. Doebelin, 'Measurement Systems – Application and Design', McGraw Hill publishing company, 3rd Edition, 2007.

EC-14.203 **Digital Electronics** **Total Lectures: 40**

3-1-0-4

Objective: The aim of this course is to present the principles and techniques of combinational and sequential digital logic design and optimization at a gate level. The use of transistors for building gates is also introduced.

Pre-requisite: Basic Electronics

1. **Number Systems and Codes:** Introduction to number systems, weighted and non-weighted codes, 1's complement, 2's complement, complement arithmetic. [2]
2. **Introduction to Boolean Algebra:** Postulates and theorems of Boolean algebra, Boolean functions, canonical and standard form, simplification of Boolean function using Boolean laws and theorems. [2]
3. **Logic Gates:** Diode and transistor as a switch, basic logic gates, derived logic gates, block diagrams and truth tables, logic diagrams from Boolean expression and vice versa, converting logic diagram to universal logic, positive logic, negative logic and mixed logic. [5]
4. **Simplification of Boolean Functions:** K-map representation, incompletely specified functions, simplification realization with gates, Quine-McCluskey method. [5]
5. **Combinational Logic:** Analysis and design of combinational circuits, half adder and full adder, half subtractor and full subtractor, binary serial and parallel adder, BCD adder, binary multipliers, magnitude comparator, decoders, encoders, multiplexers, de-multiplexers. [10]
6. **Sequential Circuits:** Latches, flip-flops, triggering of the flip-flops, master-slave flip-flop, excitation tables, conversion of the flip-flops, analysis and design of clocked sequential circuits, shift registers, counters. [10]
7. **Logic Families:** Logic gate characteristics (propagation delay, speed, noise margin, fan-in, fan-out, power dissipation), standard logic families (RTL, DCTL, TTL, ECL, MOS) [5]
8. **Programmable Logic:** Introduction to programmable logic array (PLA), programmable array logic (PAL). [1]

Outcome: Graduates will have knowledge of digital systems. They will understand how to analyze and design digital logic circuits, and be familiar with digital ICs.

EC-14.208 **Principles of Electromagnetics** **Total Lectures: 40**

3-0-0-3

Objective: To develop the understanding of basics concepts of electromagnetic field theory and its applications.

Pre-requisite: Basic understanding of laws of Physics and Mathematics

1. **Introduction**: Transformation of a point and a vector in different coordinate systems, Differential length, area, volume Physical meaning of gradient, divergence and curl, Laplacian of a scalar, Divergence theorem, Stoke's theorem, review of electrostatic and magneto static fields. [8]
2. **Time Varying Fields and Maxwell's Equations:** Faraday's law of electromagnetic induction, Maxwell's equations in integral and differential form, potential functions, electromagnetic boundary conditions. [8]
3. **Electromagnetic Waves:** Introduction, Helmholtz wave equation, Wave equations and their solutions for free space, lossy dielectric, Lossless dielectrics and good conductor medium, Poynting vector and the flow of power. Reflection of plane wave at dielectric media and conducting surfaces for normal incidence. [10]
4. **Transmission lines:** Types of transmission lines, transmission line parameters, two conductor transmission line equations, input impedance, standing wave ratio and power of transmission lines, smith chart, transmission line impedance matching techniques. [6]
5. **Guiding Structures:** General wave behaviors along uniform guiding structure, rectangular and circular wave guides, wave propagation in rectangular and cylindrical cavity resonators. [8]

Outcome: After completion of this course, students would be understanding the concept of electric and magnetic fields, both static and dynamic, and gain insight in various application areas like transmission lines and waveguides.

CS-14.225 **C++ Programming Laboratory**

EE-14.224 **Electrical Machines-II Laboratory**

0-0-2-1

Objective: The objective of the Electrical Machines-II Lab is to provide an exposure of operation of different types of A.C. motor and ac generator and give them experimental skill. It also aims to understand the generation of A.C. voltages by synchronous generator and induction generator and study their performance. It also enables the students to understand their testing, load characteristics and methods of speed control.

Pre-requisite: Electrical Machines

1. To perform load test on three-phase Squirrel cage Induction Motor.
2. To conduct no-load test and blocked rotor test on three-phse Squirrel cage Induction motor and to draw the circle diagram.
3. To obtain the equivalent circuit of a single-phase induction motor by no-load test and blocked rotor test.
4. To determine the regulation of a three-phase alternator at full load condition by ZPF method.
5. To determine the regulation of a three-phase alternator at full load condition by ASA method.
6. To conduct load test on single phase induction motor and to draw the performance characteristics.
7. To determine the regulation of a three-phase alternator by EMF and MMF method.
8. To conduct the parallel operation/synchronization of an alternator with bus bar by Synchroscope.
9. To perform the starting of Induction motor automatically by Start-delta starter.
10. To plot V and inverted V-curves of three phase synchronous motor.
11. To conduct the experiment for separation of no-load losses of three-phase induction motor.

Outcome: Students will be convergent with transformer and d.c. machines and their testing and performance aspects.

Text Books:

1. J.B. Gupta, "Theory and Performance of Electrical Machines", S. K. Kataria, 4th Edition, 2005.

Reference Books:

1. P.S. Bimbhra, "Electrical Machinery", Khanna Publisher, New Delhi, 3rd Edition, 2003.

0-0-2-1

Objective: The objective of this lab is to provide students with an understanding of the fundamental concepts in object oriented programming and to provide the skills needed for developing the software application.

Pre-requisite: CS-14.101,CS-14.111

Write C++ Programs to illustrate the concept of the following:

1. Class and Objects
2. Arrays and Array of objects
3. Scope resolution operator and Memory management operators
4. Friend functions
5. Function overloading and operator overloading
6. Constructors and Destructors
7. Inheritance
8. Polymorphism and Virtual Functions
9. this Pointer
10. Exception handing
11. File I/O Operations
12. Templates- function and class templates

Outcome: Upon the completion of the course students have knowledge of the underlying the static member, friend function, operator overloading, exception handling, inheritance and polymorphism in object oriented programming application.

Text Books:

1. Herbert Schildt, "C++: The Complete Reference", McGraw Hill, 4th edition, 1994.
2. Robert Lafore, "Object-Oriented Programming in C++", SAMS, 4th edition, 2001.

Reference Books:

1. Bjarne Stroustrup,"Programming-Principles and Practice Using C++", Addison-Wesley, 2nd Edition, 2014.
2. E. Balagurusamy, "Object Oriented Programming With C++", McGraw Hill, 4th edition, 2008.

EE-14.210 **Comprehensive-I**

0-0-0-3

Objective: This course provides the:

1. The fundamental principles in electric circuit theory and to be able to extend these principles into a way of thinking for problem solving in mathematics, science, and engineering.
2. To expose the students to the concepts of various types of electrical machines and applications of electrical machines.
3. Build a foundation of basic knowledge required for electrical power engineers.
4. Understand the sources of energy and their contributions to the energy and power needs of the nation and the world.

Pre-requisites: Network Analysis, Electrical Machine-I, Electrical Machine-II, Power Plant Engineering, Electrical Measurement & Instrumentation

1 **Network Analysis:** Kirchoff's Laws in the frequency domain and impedance combinations, Nodal and mesh analysis for phasor circuits, Power in the Unbalanced three-phase systems, Application of the Laplace transform to electric circuits and the transfer function

2 **Special Machines:** Tacho-generator, AC and DC servomotor, Linear induction motor, Single phase motor, Double field revolving theory, Capacitor start capacitor run motors, Shaded pole motor, Repulsion type motor, Universal motor, Stepper motor.

3 **Electrical Measurement and Instrumentation:** Instrumentation amplifiers- single differential amplifier and three amplifier configurations, D/A and A/D converters, and concepts of a measurement channel and its components, Data acquisition and distribution configurations, analyze sample and hold circuits and multiplexers, Transducer interfacing techniques, passive and active transducer measurement requirements, Error analysis in the measurement channel, types of errors; consider transducer errors, transducer output linearization, instrumentation amplifier errors, filter errors, A/D converter errors, sample and hold and multiplexer errors.

4 **Power Generation System:** Steam power plant generation cycles, Nuclear Power Generation Safety considerations in the nuclear industry. Developments in nuclear fusion. Decommissioning problems of nuclear sites. Nuclear waste disposal systems, Fuel Cells-Definition and principles of operation. Losses and efficiency. Possible fuels. Fuel-cell technologies and applications, Combined Heat and Power (CHP) schemes, Application of CHP systems for the provision of heating, cooling and electric power. Selection criteria of CHP prime-movers.

Outcome: Upon completion of this course, the students should be able to:

1. Use network techniques, to analysis large circuits.
2. Understand constructional details, principle of operation of Special Machines.

Text Books:

1. I.J Nagrath, "Electric Machines", McGraw hill Edition.4th Ed. 2010.
2. F. F. Kuo "Network Analysis & Synthesis", John Wiley & Sons, 2nd Ed., 1999.

Reference Books:

1. M. G Say, "Alternating Current Machines", ELBS & Piman, London, 2nd Ed 1984.
2. D Roy Choudhury., "Networks and Systems", New Age International Publishers, 2nd Ed 2010.
3. A K Sawhney, "A course in Electrical & Electronic Measurements & Instruments", Dhanpat rai, 3rd Edition, 2005.

EE-14.301 **Transmission & Distribution** **Total Lectures: 40**

3-1-0-4

Objective:
1. To learn the fundamentals of power system for designing a system that meets specific need.
2. To understand the factors affecting Insulators and also in Under Ground cables.
3. To calculate the various parameters in Distribution System.

Pre-requisite: Network Analysis& Synthesis

1. **Introduction:** Structure of a power system, Effect of Transmission voltage, Load factor, diversity factor, plant capacity factor, plant utilization factor, different types of tariffs, per unit quantities and its advantages, Impedance and Reactance Diagram. [5]

2. **Transmission Line Parameter:** Configuration, Type of conductors, Resistance of line, Skin & Proximity Effects, Calculation of Inductance and capacitance of single phase, three phase, Single circuit and double circuit transmission lines. [7]

3. **Performance of Transmission Lines:** Representation of short, medium and long transmission lines, Ferranti effect, SIL, Tuned Power Line, Power flow through transmission lines. [6]

4. **Insulator and Corona:** Overhead lines insulators type of insulators and their applications Potential distribution over a string of insulators, Methods of Equalizing the potential, Phenomenon of Corona, Corona Loss, Factors affecting Corona, Methods of reducing corona. [6]

5. **Mechanical Design of Transmission Lines:** Catenary curve, Calculation of sag and Tension, Effects of wind and ice Loadings, Sag Templates, Vibration dampers. [5]

6. **Underground Cables:** Types of Insulation for Cable, Sheath, Armour and Covering, Classification of cables, Effective Conductor Resistance, Inductive Reactance, Capacitance of single phase and three phase cables, Grading of Cables, Problems with Underground cables. [5]

7. **Distribution:** Comparison of various Distribution systems, type of Primary Distribution systems and Secondary Distribution systems, Choice of transmission voltage, Kelvin's law, Limitation of Kelvin's law. Necessity of neutral grounding, various methods of neutral grounding. [6]

Outcome: At the end of this course the student is expected to have understood the following:
- Basic principles of supply systems.
- Mechanical & electrical design of overhead lines.
- Performance of transmission lines.

Text Books:
1. Wadhwa C.L. "Electrical Power Systems Electronics", New Age International Publishers, 4th Edition, 2011.
2. Gupta, B.R., "Power System Analysis and Design" S.Chand and Co., Ltd, 2nd Edition, 2005.

Reference Books:
1. Grainger, J.J. and William D. Stevenson Jr., "Power System Analysis", McGraw Hill, 3rd Edition,2005.
2. AbhijitChakrabarti, SunitaHalder "Power System Analysis: Operation and Control", Prentice Hall of India, 2nd Edition, 2008.

EE-14.303 **Control Systems Engineering** **Total Lectures: 40**

3-1-0-4

Objective: The student gains the knowledge of the fundamental principles of analog and digital control system engineering, time response and frequency response analysis with its practical implementation. This course helps in understanding the design of Compensator and PID controller for the Automatic control of Industry.

Pre-requisite: Mathematics, Network Analysis& Synthesis

1. **Introduction:** Introduction to control systems, digital control system, types of control systems and their examples, mathematical modeling of electrical and mechanical systems (f-v and f-i analogy). [8]

2. **Reduction Techniques:** Block diagram reduction and signal flow graph representation of systems. [6]

3. **Domain Analysis:** Introduction, correlation between Transient response and frequency response, standard input signals, Response of 1st and 2nd order systems, time domain specifications i.e. rise time, peak time, delay time, peak overshoot, settling time steady state error etc., different types of feedback systems, Steady state errors for unit step, unit ramp and unit parabolic inputs, controller components. [10]

4. **Stability:**Introduction, concept of stability, conditions for stable system, asymptotic, relative and marginal stability, Routh-Hurwitz criterion for stability. [4]

5. **Plotting Techniques:** Root locus techniques, Bode plots, polar plots Nyquist criterion and Nichol's chart. [8]

6. **State Variables:** Analysis of systems, state vector, state space, advantages of state space techniques, state space representation, State variable analysis and design. [4]

Outcome: After completion of the course,

- The student will be able to get acquainted of analog and digital control system.
- The student will analyze and to design and development of automatic controller for industrial application.
- The student will gain the knowledge of stability analysis and improvement of stability for control system.
- This course becomes very beneficial for the graduates who wish to work in core sectr industry as most of the core sector is state-of-art control.
- This course becomes very beneficial for the 4th year student who will choose elective paper in Digital control system and other control system elective.

Text Books:

1. K. Ogata, "Modern Control Engineering," Pearson Education/Prentice Hall of India, 4th Edition, 2003.

1. Syed HasanSaeed, "Automatic Control Systems (with MATLAB Programs)," S.K. Kataria& Sons Publishers, 6th edition, 2008.
2. SamarjitGhosh, "Control Systems: Theory and Applications," Pearson Education, 2nd Edition, 2012.
3. M.N. Bandyopadhyay, "Control Engineering Theory and Practice," Prentice Hall of India, 2nd Edition, 2003.

EC-14.307 **Fundamentals of Signal Processing** **Total Lectures: 40**

3-1-0-4

Objective: This course aims to provide the students with a basic understanding of the fundamental characteristics of signals and systems. It equips the students in understanding signals and systems in terms of the time and transforms domains, convolution, filtering, modulation and sampling. It introduces the mathematical approach to manipulate discrete time signals, which are useful to design and analyze filters.

Pre-requisite: Engineering Mathematics, Network analysis

1 **Introduction to Digital Signal Processing**: Introduction , Discrete time signals & systems, linear shift invariant systems, stability and causality, Linear-constant coefficient difference equations, Frequency domain representation of discrete time signals and systems, properties of the Discrete Time Fourier transform (DTFT), Sampling and discrete time processing of continuous-time signals. [10]

2 **Z Transform**: Applications of z-transforms, solution of difference equations of digital filters, System function, stability criterion, and frequency response of stable systems, one sided Z-transform and its applications. [8]

3 **Discrete Fourier series:** Properties of discrete Fourier series, DFS representation of periodic sequences. Discrete Fourier Transforms, Properties of DFT, Fast Fourier Transforms (FFT) Radix-2 decimation in time and decimation in frequency FFT Algorithms, Inverse FFT. [8]

4 **IIR Digital Filters:** Analog filter approximations - Butterworth and Chebyshev, Design of IIR Digital filters from analog filters, Bilinear transformation method, step & impulse invariance techniques, Realization of IIR digital filters. [7]

5 **FIR Digital Filters:** Characteristics of FIR Digital Filters frequency response, Design of FIR Digital Filters using Window Techniques. Comparison of IIR and FIR filters, Realization of FIR digital filters. [7]

Outcome: Upon completion of the course the student will be able to

- Analyze the spectral characteristics of continuous-time periodic and a periodic signals using Fourier analysis.
- Analyze discrete-time signals and systems using DFT and FFT.
- Apply the Laplace transform and Z- transform for analyze of continuous-time and discrete-time signals and systems
- Design and implement digital finite impulse response (FIR) filters.
- Design and implement digital infinite impulse response (IIR) filters.

CS-14.202 **Java Programming** **Total Lectures: 40**

3-0-0-3

Objectives: The objective of this course is to:

- Cover issues related to the definition, creation and usage of classes, objects and methods. Become comfortable with object-oriented programming and learn to think in terms of objects.
- Discuss the principles of inheritance and polymorphism. The concepts would be demonstrated through problem analysis assignments.
- Provide the foundation of good programming skills by discussing key issues of the design of object-oriented software, including programming design patterns and documentation.
- Cover the basics of APIs as well as allow students to explore the Java Abstract Programming Interface.

Prerequisites: Programming languageC, C++, Data Structures

1. **Overview:** Introductionto java, importance of Java, interactive development environments: Eclipse/Net Beans, basics of OOP. [4]
2. **Data Types, Variable and Arrays:** primitive data types, type casting,arrays, operators and control structures. Identifiers, constants and literals. [6]
3. **Classes and Objects:** Class fundamentals, declaring objects, assigning object referencevariables, introducing methods, constructors, the this keyword, garbage collection, the finalize() method, overloading methods, using objects as parameters and return type, introducing access control, understanding static, introducing final, introducing nested and inner classes, exploring the string class, using command-line arguments. [9]
4. **Inheritance:** Inheritance basics, using super, multilevel hierarchy, constructor in hierarchy, method overriding, dynamic method dispatch, using abstract classes, using final in inheritance, the object class. [4]
5. **Package, Interfaces and Exception Handling:** Packages, access protection, importing packages, interfaces, exception-handling fundamentals, exception types, using try and catch, multiple catch clauses, nested try statements, throw, throws, finally, Java's built-in exceptions, user defined exception. [6]
6. **Multithreaded Programming:** The Java thread models, the main thread, creating multiple threads, thread priorities, managing threads, Thread class built-in function. [4]
7. **I/O and String Handling:** I/O basics, reading console input, writingconsole output, the Print Writer class, reading and writing files, string constructors, operations on String, String tokenizing, String Buffer. [7]

Outcomes: Upon completion of this course, students are able to:

- Understand the concepts of OOP and usage principles of inheritance, polymorphism, encapsulation and method overloading.
- Identify classes, objects, members of a class and the relationships among them needed for a specific problem.
- Develop programs using the in-built Java API and the Java standard class library.
- Use of development environment like Eclipse for collaborative programming/editing.

2. PaulDeitel,Harvey Deitel, Java How To Program (Early Objects), Prentice Hall, 10th Edition, 2014.

EE-14.321 **Control Systems Laboratory**

0-0-2-1

Objective: This laboratory course facilitates the students to get a comprehensive exposure to various techniques /principles and applications of control systems for real life implementation like temperature control of oven, position control of DC/AC servomotor, synchro devices as a control transformer, robotic control systems etc.

Prerequisites: Nil

1. To study the performance of various types of controllers (P, PI, PID) in order to control the temperature of an oven.
2. To study the performance analysis of PC based analogue and digital motor control system (DCMC) with second order feedback system behavior.
3. To study the characteristics of a Synchro Transmitter Receiver pair and use these as torque-synchro and angular error detector.
4. To study the performance characteristics of angular position error detector (AC&DC excitation) using two Potentiometers.
5. Using Nyquist Stability technique, find the stability of negative feedback control system whose open loop transfer function is given by $G(s)\,H(s) = 10/[(s+1)(s+2)(s+3)]$ Also verifies the MATLAB results/stability with theoretical method after plotting on graph sheets.
6. To study the performance characteristics of an AC servo motor angular position control system and analysis of transient characteristics with gain Variation.
7. To study the performance characteristics of a DC servo motor angular position control system and analysis of transient characteristics with gain Variation and additional tachometer feedback.
8. To study the Characteristics of an A.C. Servo Motor and determine its transfer function.
9. Plot the Root locus diagram for investigating the stability for the system whose open loop transfer function given by $G(s)\,H(s) = K/[s(s+4)(S+5)]$. Using MATLAB Code, verify the results with Conventional method.
10. To study and design the pc based universal robotic system as snake.
11. Draw the bode plot for the transfer function $G(s) = 50/[s(1+0.25s)(1+0.1s)]$.
    From the graph, determine:
    1. Gain Crossover Frequency
    2. Phase Crossover Frequency
    3. Gain Margin
    4. Phase Margin
    5. Stability of the system

    Also, verify the MATLAB results with theoretical value.
12. Obtain the state space, pole-zero and residue pole form of the control system whose transfer function is given by.

Outcome: The students shall develop an insightful knowledge on various techniques and concepts of analysis & design of control system for different applications like temperature control of oven, position control of DC/AC servomotor, synchro devices, Robotic control systems etc.

CS-14.222 **Java Programming Lab**

0-0-2-1

Objectives: The objective of this course is to:

- Become comfortable with object-oriented programming and learn to think in terms of objects.
- Provide the foundation of good programming skills by discussing key issues to the design of object-oriented software, including programming design patterns, documentation.

Pre-requisites: Object Oriented Programming (C++) Concepts

Assignments/ List of Programmes:

1. Basic programmes illustrating data types, control structures etc.

2. Programs illustrating: Methods and Class, Constructors, Overloading Methods, Static Data and Methods, Final Keyword and Command Line Arguments

3. Programs using Inheritance, Super Keyword, Over-riding, abstract Classes, Final in Inheritance

4. Programs using Packages and Interfaces.

5. Programs Using Exception Handling.

6. Programs for creating and managing multiple threads.

7. Programs illustrating Input/output Operations

Outcomes: Upon completion of this course, students are able to:

- Understand the concepts of OOP as well as the purpose and usage principles of inheritance, polymorphism, encapsulation and method overloading.
- Create Java application programs.
- Use of development environment like Eclipse for collaborative programming/editing.

Text Books:

GE 303 **Interpersonal Communication** **Total Lectures: 30**
0-0-2-1

Objectives: To provide the training for improving communication and interpersonal skills

Pre-requisites: Nil

1. **Reading Comprehension**: To develop skills such as comprehending the text, composition, skimming and scanning. [12]
2. **Idioms and Phrasal Verbs:** Understanding idioms, Introduction to Phrasal verbs, verb and preposition/adverb combination, usage of idioms and phrasal verbs. [2]
3. **Report Writing**: Defining the purpose and the scope of a report, Structure of a report, and the process of writing a report. [4]
4. **Phonetics**: Introduction to international phonetic alphabet, speech organs and sound symbols, transcription of words, stress and syllable. [6]
5. **Paragraph writing**: Introduction to different types of writing and development of writing skills through exercises. [3]
6. **Composition skills**: Resume writing and composing an email. [3]

Outcome: Upon completion of this course, students are able to improve communication and interpersonal skills

Text Books:

1. Tongue R.K, Kumar S.K, An English Miscellany, Oxford University Press, New Delhi, 4th Edition, 2001

Reference Books:

1. Rutherford A, Basic Communication Skills for Technology, Pearson Education, 2nd edition, 2002.
2. Sharma R.C. Krishna M, Business Correspondence and Report Writing, McGraw Hill, 2nd edition, 1999.
3. Bhatnagar R.P., English for Competitive Examination, Macmillan India Limited, 5th edition, 1998,.

CS-14.313 **Computer Networks** **Total Lectures: 40**
3-0-0-3

Objective(s):

1. To give basic concepts of network models&understandof different encoding techniques, physical, data link &explain how data communication takes place.
2. To be able to carry out the analysis of various routing and congestion control Algorithms and their complexity & understand of different MAC layer protocols.
3. To give the basic understanding of error detection and correction and different methodologies for implementing them & understanding of internet application layer protocols.

Prerequisite(s): Programming languageC, C++, Data Structures

1. **Overview and Network Model:** Network topologies, protocols and standards, basic elements of a network, OSI reference model, TCP/IP model, categories of networks- LAN, WAN and MAN. [6]
2. **Physical Layer:** Manchester, differential Manchester encoding, NRZ, multilevel binary and bi-phase encoding, scrambling techniques, packet and circuit switching, transmission media. [6]
3. **Data Link Layer:** Framing, stop and wait protocol, sliding window protocol, performance and efficiency, HDLC, error detection, parity check. [4]
4. **MAC Layer:** Pure and slotted Aloha, throughput characteristics, CSMA/CD, performance. [3]
5. **Local Area Network:** IEEE 802.3, 802.4, 802.5, performance evaluation, FDDI, DQDB. [6]
6. **Network Layer:** Virtual circuits, datagrams, IPv4, IP address classes, super netting, IP fragmentation, ARP, RARP, routing algorithms, congestion control algorithms, leaky bucket, token bucket, ICMP, IPv6. [6]
7. **Transport Layer:** Duties of the transport layer, connection, TCP, TCP services, TCP header, UDP, UDP header. [5]
8. **Application Layer:** Client/Server model, DNS, FTP, HTTP, SMTP, SNMP. [4]

Outcome: Upon completion of this course, students are able to:

- Understand layered architecture, explain and compare Internet protocols&encoding techniques and switched networks.
- Understand framing, flow, error control protocol and medium access control protocol.
- Describe IEEE standards for local area network&datagram, fragmentation, routing and congestion control algorithm.Implement client server program.

Text Books:
1. Tanenbaum A. S., Computer Networks, Prentice-Hall of India, 5th Ed., 2011.
2. Stallings W., Data and Computer Communications, Prentice-Hall of India, 8th Ed., 2010.

Reference Books:
1. Forouzan B. A., Data Communications and Networking, McGraw-Hill, 3rd Ed., 2004.
2. Hayes J. F., Modeling and Analysis of Computer Communication Networks, Khanna Publishers, 1st Edition, 1987.

EE-14.302 **Power System Analysis** **Total Lecture: 40**

3-1-0-4

Objective:
- To know the necessity of load flow in a regulated system.
- To examine the need of various analysis like fault analysis, short circuit analysis stability analysis, steady state and transient analysis.

Prerequisite: Transmission & distribution

1. **Load Flow Studies:** Bus admittance(Y bus) and Impedance (Z bus) matrices and their formation. Power flow in a transmission system, bus classification, Load flow equations and solution techniques-Gauss iterative method, Gauss-Seidel method, Newton-Raphson method, comparison of load flow solution techniques. [9]
2. **Fault Calculation and Network:** Symmetrical fault, Significance of Positive, Negative and Zero Sequence Components, Fault calculation, Sequence Networks, Unsymmetrical fault analysis – Single Line to Ground faults, Line to Line fault, Double line to Ground fault. [9]
3. **Power System Stability:** Steady state stability and transient stability- stability problem, rotor dynamics and swing equation, power angle equation and diagram, equal area criterion and its application, critical clearing angle, fault clearing time, factors influencing transient stability, methods of improving stability. [8]
4. **Economic Load Dispatch:** Station performance and operating characteristics, Incremental rate theory, optimal Load distribution within generating station and between various generating stations in a region, Transmission loss equation, Calculation of losses and Generation scheduling and dispatch. [8]
5. **Power System Control:** Load Frequency control:Load Frequency Problems, Speed Governing System, Reasons for Limits on Frequency. Excitation systems, Automatic Voltage Regulators, SCADA and Computer control. [6]

Outcome:
- Apply the load flow application to various power system problems like minimization of transmission line losses, minimization of the total fuel cost etc.,
- Analyze the economic dispatch problem in thermal power plant
- Design a power system solution based on the problem requirements and realistic constraint.

Text Books:
1. Grainger,J.J. and William D. Stevenson Jr., "Power System Analysis", McGraw Hill, 4th Edition,2005.
2. Wadhwa.C.L. "Electrical Power Systems Electronics", New Age International Publishers, 3rd Edition, 2011.

Reference Books:
1. Ashfaq Husain "Electrical Power Systems", CBS Publishers and Distributors, 4th Edition, 1996.
2. AbhijitChakrabarti, SunitaHalder "Power System Analysis: Operation and Control", Prentice Hall of India, 2nd Edition, 2008.

EE-14.304 **Power Electronics** **Total Lectures: 40**

3-0-0-3

Objective:

- To introduce to students the theory and applications of power electronics systems for high efficiency, renewable and energy saving conversion systems
- To prepare students to know the characteristics of different power electronics switches, drivers and selection of components for different applications
- To develop students with an understanding of the switching behavior and design of power electronics circuits such as DC/DC, AC/DC, DC/AC and AC/AC converters

Prerequisite: Network Analysis and Synthesis, Basics of Electronics Engineering, Engineering Mathematics

1. **Introduction:** Review of power semiconductor devices, SCR, Static and dynamic characteristics, Turn-on and Turn-off methods and circuits, Ratings and protection of SCRs, Series and parallel operation of thyristor, Other members of thyristor family. [8]
2. **Phase Controlled Converters:** Principle of phase control, Single phase half wave circuit with different types of loads, Single phase and three phase semi converter and full converter bridge circuits, Single phase dual converters and their operation with circulating and non-circulating currents. [10]
3. **AC Voltage Controllers:** Types of single-phase voltage controllers, Singlephase voltage controller with R and RL type of loads, gate pulse requirements to trigger the SCRs of ac voltage controllers. [5]
4. **Cycloconverters:** Principles of operation, Single phase to single phase step up and step down cycloconverters. Three phase to single phase cycloconverter. [5]
5. **DC Choppers:** Principle of chopper operation, Control strategies, Types of choppers, Step up and step down choppers, Types of choppers and operations. [5]
6. **Inverters:** Single phase VSI: half bridge and full bridge inverters, three phase bridge inverters with 180 degree and 120 degree modes of operation, Series and parallel inverters, Introduction to current source inverters. [7]

Outcome:

- The student will be able to understand the principle of operation of commonly employed powerelectronic converters
- The student will be capable of analyzing non-linear circuits with several power electronic switches
- The student will be equipped to take up advanced courses in Power Electronics and its application areas

Text Books:

EC-14.212 **Communication Engineering** **Total Lectures: 40**
3-0-0-3

Prerequisite: Engineering Mathematics, Electronics Devices and Circuits

Objective: To equip students with various issues related to analog and digital communication such as modulation, Demodulation, Noise handling, Data conversion and Multiplexing.

1. **Introduction:** Model of a communication system, analog and digital signal, Signal bandwidth, noise calculation, noise figure, noise temperature. [6]
2. **Linear Modulation & Demodulation Techniques:** Need of modulation, Frequency translation, amplitude modulation, double side band, double side band suppressed carrier, single side band, vestigial side band, bandwidth, and power efficiency consideration of different linear modulations, time domain and frequency domain analysis of different modulation schemes and different types of demodulation techniques. [10]
3. **Angular Modulation & Demodulation Techniques:** Frequency modulation, phase modulation, bandwidth consideration of these modulations, narrow band and wide band frequency modulation, commercial broadcasting systems and different types of demodulation techniques. [8]
4. **Digital Communication Techniques:** Advantages of digital communication over analog communication, Shannon capacity, sampling theorem and techniques, quantization techniques, PCM, DPCM, DM. Digital modulation and demodulation techniques ASK, FSK, PSK, bandwidth consideration of different digital modulation schemes. [10]
5. **Advanced Communication Techniques:** Optical fiber communication, microwave communication, wireless communication, GSM, FDM, TDM, CDMA. [6]

Outcome:

- Students will develop the basic understanding signals and the means of their transmission.
- Students will be familiar with the need of modulation and advantages and disadvantages of different modulation schemes.
- Students will have knowledge of advance communication techniques and emerging new technologies in the field of communication.

Text Books:

1. B. P. Lathi, Modern Digital and Analog communication Systems, Oxford University Press, 3rd Edition, 2010.

2. Taub& schilling, Principles of communication Engineering, McGraw Hill, 4th Edition, 2009.

EC-14.202 Microprocessor Programming and Interfacing Total Lectures: 40
3-0-0-3

Objective: To develop an in-depth understanding of the operation of microprocessors and microcontrollers, machine language programming & interfacing techniques.

Pre-requisite: Analog and Digital Circuits

1. **The Microcomputer:** Evolution ofmicroprocessor, address bus and data bus, introduction to machine language and assembly language, logic devices for interfacing: 74244, 74245, 74373. [3]
2. **The 8085 Processor:** Architecture, pin diagram and description of various signals, read, write and op-code fetch cycles, interrupt structure, instruction set and Assembly language programming. [12]
3. **The 8086 Microprocessor Architecture:** Architecture, details of sub-blocks such as EU, BIU; memory segmentation and physical address computations, pin diagram and description of various signals, minimum and maximum mode of operations, supporting chips viz. 8284, 8288 and memory mapping. [8]
4. **Programming of 8086:** Addressing modes of 8086, instruction set of 8086, assembly language programming, counters and time delays, stack structure of 8086 and subroutine. [7]
5. **Interfacing of 8085/8086 with Programmable Chips:** Interfacing of 8255 Programmable peripheral interface, 8251 USART, 8253/8254 Programmable Interval Timer and Direct Memory Access Controller 8237/8257 DMA, 8259 Programmable Interrupt Controller. [10]

Outcome: Upon completion of this course, the student will be able to:

- The student will learn the internal organization of some popular microprocessors and microcontrollers.
- The student will learn hardware and software interaction and integration.
- The students will learn the design of microprocessors/microcontrollers-based systems.

Text Books:

1. Ramesh S. Gaonkar, Microprocessor Architecture, Programming and Application with the 8085; Penram International Publishing (India), 5th edition, 2006
2. A. K. Ray & K. M. Bhurchandi, Advanced Microprocessors and Peripherals, McGraw Hill, 4th Edition, 2012

Reference Books:

1. D. V. Hall, Microprocessors and Interfacings; McGraw Hill, 2nd Edition, 2008.
2. B. P. Singh and RenuSingh, Advanced Microprocessors and Microcontrollers, New Age International Publishers, 3rdEdition, 2012.

EE-14.322 **Basic Electrical Simulation Laboratory**

0-0-2-1

Objective: The objective of Basic Electrical Simulation laboratory is to make the students aware about the use and applications of simulating software. The course will impart hands on experience in verification of circuit laws and theorems, measurement of circuit parameters, study of circuit characteristics using MATLAB & ETAP. It also gives practical exposure to the usage of different power circuits with different condition.

Pre-requisite: Basic electrical engineering and basic power system fundamentals

1. Basic MATLAB desktop, help Browser, types of files, basic commands.
2. Introduction to SIMULINK, creating and simulating a SIMULINK model.
3. Plotting of single phase and three phase voltage waveforms using MATLAB through programming techniques.
4. Simulink model to generate sine and cosine waveforms.
5. Response of RL circuit and transient study using MATLAB.
6. Response of RC circuit and transient study using MATLAB.
7. Response of RLC circuit and transient study using MATLAB.
8. To plot the daily load curve for the given data using MATLAB.
9. Introduction to basics of Electrical Transients Analyzer Program (ETAP).
10. Study and operation of various ETAP modules Viz. load flow, short circuit and harmonics.
11. Construction of single line diagram of a power system using ETAP Software.
12. Modeling of power distribution network using ETAP Software.
13. Load Flow analysis using ETAP Software.

Outcome: Upon completion of this course, the student will be able to:

- Develop computer programs for basic electrical circuits.
- Develop computer models for power system components.
- Design, simulate and analyze circuits using simulation packages.

Text Books:

1. Nagrath I. J. & Kothari D. P., Modern Power System Analysis, McGraw Hill Publication Company Ltd, 2nd edition, 2002.
2. Jain Shailendra, Modeling and Simulation using MATLAB Simulink, Wiley India & sons, 5th Edition, 2011.

Reference Books:

1. Pai M. A Computer Techniques in Power Systems Analysis, McGraw Hill Publication Company Ltd, 3rd Edition, 2003.
2. Kusic G. L, Computer Aided Power Systems Analysis, CRC Press, 2nd Edition, 2008.

EE-14.324 **Power Electronics Laboratory**

0-0-2-1

Objective: To enable the students to develop hands on experience in analyzing, designing and carrying out experiments on various electrical networks by make use of power electronic components. It aims to familiarize the switching devices, power converters and its applications in various systems for power control.

Pre-requisite: Network Analysis and Synthesis, Basics of Electronics Engineering, Engineering Mathematics

1. To obtain the V-I characteristic of an SCR and to find out it's latching and holding currents.
2. To obtain the Drain and Transfer Characteristic of a MOSFET.
3. To obtain the V-I characteristic of TRIAC.
4. Study of SCR (i) Resistor Triggering circuit (ii) Resistor Capacitor Triggering circuit for Half wave rectifier.
5. Study of SCR (i) Resistor Triggering circuit (ii) Resistor Capacitor Triggering circuit for Full wave rectifier.
6. Study of Step-Up Chopper with (i) resistive load (ii) resistive, inductive load.
7. Study of Step Down Chopper with (i) resistive load and (ii) resistive – inductive load.
8. To study the forced commutation process of an SCR.
9. Study of Single Phase Bridge Inverter with
   i. Resistive-Capacitive load
   ii. Inductive-Capacitive load
   iii. Resistive Capacitive and Inductive load.
10. To write and execute a program (i.e. STL and Ladder Logic) for SIEMEN make P.L.C to flash a light at regular intervals of time.
11. To simulate a program for a PLC controller to control the traffic lights using 'BRYTONIC' software.
12. To design and develop a simulation schematic for the performance analysis of Half wave rectifier with different loads, using MATLAB SIMULINK toolbox.
13. To design and develop a simulation schematic for the performance analysis of Full wave rectifier with different loads, using MATLAB SIMULINK toolbox.

Outcome:

- Understand the characteristics of various switching devices and appreciate its applications in various electrical networks/systems.
- Analyze and design the operation of power switching converters.
- Develop practical control circuits for various real time applications.
- Analyze and prepare the technical report on the experiments carried out.

Text Books:

1. Muhammad H. Rashid, Power Electronics Handbook, Academic Press, 4th Edition, 2010.
2. Power Electronics Laboratory: Theory, Practice & Organization, (Narosa Series in Power and Energy Systems) Alpha Science International Ltd, July 2006.

Reference Books:

1. Muhammad H. Rashid, Power Electronics, Prentice Hall of India Private Limited, 3rd Edition, 2006.

EC-14.222 Microprocessors Programming and Interfacing Laboratory

0-0-2-1

Objective: To introduce to students the basics of 8086 microprocessor, assembling language programming and interfacing with various modules.

Pre-requisite: In this laboratory the students are expected to learn to apply their theoretical knowledge of both the hardware and software aspects of microprocessors. Programming of the device is done in assembly language. Some of the experiments that follow the construction project deal with software while others deal with the problems of interfacing of microprocessors.

1 [a] Write a program for 8085 microprocessor to move a eight bit number in register A, B, C and D. Verify the content of all the registers after execution of program.
Also find out the followings:
(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

[b] Load an eight bit number stored in memory location 4000H into register A. Now load the content of A in B and in memory location 5000H. Verify the contents of A, B and memory location 5000H.
Also find out the followings:
(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

2 Write an assembly language program to add two eight bit numbers stored in memory and store the 8 LSBs and 8 MSBs of sixteen bit result at 2000H and 2001 respectively. Verify the content of flag register after addition.
Also find out the followings:
(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

3 [a] Write a program to perform multiplication of two 8 bit numbers using 8085 microprocessor.
Also find out the followings:
(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

[b] Let two numbers are stored at memory locations 2000H and 2001H. Write a program for 8085 microprocessor to perform following actions:
If 1^{st} number > 2^{nd} number then store 00H at 3000
If 1^{st} number < 2^{nd} number then store FFH at 3000
If 1^{st} number = 2^{nd} number then store 99H at 3000
Also find out the followings:
(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

4 [a] Write a program for 8086 microprocessor to transfer a series of five eight bit number stored from memory location 2000:2000 to new memory location 3000: 3000.
Also find out the followings:
(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

[b] Write a program for 8086 microprocessor to transfer a series of five sixteen bit number stored from memory location 2000:2000 to new memory location 3000: 3000.
Also find out the followings:

(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

5 [a] Write an assembly language program for 8086 microprocessor to find out the smallest number from a series of five eight bit numbers and store it at memory location 2000H: 2000H.
Also find out the followings:
(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

[b] Write an assembly language program for 8086 microprocessor to find out the largest number from a series of five eight bit numbers and store it at memory location 2000H: 2000H.
Also find out the followings:
(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

6 Create a look-up table from memory location 2000H: 1000H to store square of numbers from 00 to 09. Write an assembly language program for 8086 microprocessor to find out the square of a number stored at 2000H: 100AH and store the result at 2000H: 100BH.
Also find out the followings:
(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

7 [a] Write a program to arrange the series of four eight bit numbers in ascending order.
Also find out the followings:
(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

[b] Write a program to arrange the series of four eight bit numbers in descending order.
Also find out the followings:
(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

8 Interface three LEDs with 8086 Kit to form traffic light control logic.
Also find out the followings:
(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

9 Interface a buzzer with 8086 microprocessor with the help of relay and write a program to control the ON-OFF sound from the buzzer. Also find out the followings:
(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

10 Interface a DC motor with 8086 microprocessor and write a program to control its operation.
Also find out the followings:
(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

Laboratory Assignment: Assembly and Machine Language Programming, Signal Generators, Interfacing Basic I/O devices like Keypad, LED display, Usage of Timers & USART Peripherals.

Outcome: After the basic knowledge of microprocessor and microcontroller interfacing and their applications, the student will be able to:

- Analyze and apply working of 8086.
- Compare the various interface techniques. Analyze and apply the working of 8255, 8279, 8259, 8251, 8257 ICs and design and develop the programs.
- Learning the Communication Standards.

EC-15.312 **Advanced Radio Access Network (ARAN)** **Total Lectures: 40**

3-0-0-3

Objective To acquire skills on different legacy and advance RAN's Architecture, Design & Optimization along with latest industries concepts on 5G, IOT, Volte, RAN Cloud etc.

Prerequisite Digital Modulation Techniques & Data Transmission, Antenna and Wave Propagation, Basics of Mobile Communication

1. **Introduction to RAN:** Telecom E2E approach, RAN Life Cycle**,** RF basics, Microwave Theory, Propagation Models, Modulation Theory, Antenna Theory. Latest Industry Concepts – 5G, IOT, Volte, RAN Cloud [4]

2. **RAN Overview**: Introduction to Cellular Concepts, Introduction to Power Control, Introduction to Protocol Stacks, GSM, WCDMA, LTE (Overview, Architecture, Air Interface), Generalized Call Flows [12]

3. **RAN Design:** RF Design Overview, Initial Radio Network Design (Link Budget, Radio Network Dimensioning & Nominal Design), Final Radio Network Design, Radio Planning Tools & IBS Introduction, Radio Propagation Model Tuning, LRAN Initial Radio Network Design (Sample Report) [12]

4. **RAN Optimization:** Pre Launch Optimization (Process Overview, Introduction to Drive Testing (Data Collection Methodology, Data Post Processing), Post Launch Optimization, (Process Overview, Introduction to Counters and OSS, KPI Improvement Methodology) [12]

Outcome: After completion of this course, students would be able to understand the industry level ways of working of RAN with different design and optimization techniques. Students will get heads up in terms of upcoming advance technology concepts.

EE-14.305 **Power Plant Engineering** **Total Lectures: 40**

3-0-0-3

Objective: This course facilitates the students to understand the basic functioning of generation and design/economics consideration of various power plants.

Pre-requisite: Electrical Engineering course of First Year.

1 **Introduction:** Energy sources and their availability, Principle types of power plants, Their special features and applications, Present status and future trends. [10]
Economic aspects in power Generation: Terms commonly used in system operation, various factors affecting cost of generation: Load curves, load duration curves, Connected load, maximum load, Peak load, base load and peak load power plants, load factor, Plant capacity factor, Plant use factor, Demand factor, diversity factor, Cost of power plant.

2 **Thermal Power Plant:** General developing trends, Essentials, Plant layout, Coal storage, Preparation, Handling, Feeding and burning, Ash handling, Dust collection, High pressure boilers and steam turbines, Their main components like super heaters, Economizers, Pre-heaters etc., Fuel efficiency/heat balance. [8]

3 **Hydro Electric Power Plants:** Classifications, Plant layout, various components, Types of turbines, Pumped storage, hydro-electric plants, advantages and disadvantages. Environmental aspects for selecting the sites and locations of hydro power stations. [8]

4 **Gas Turbine Power Plants:** Schematic arrangement, advantages and disadvantages of Gas turbine power plant. Open cycle and Closed cycle gas turbine power plant, Combined cycle power plant, Comparison of various power plants. [6]

5 **Nuclear Power Plant:** Nuclear fuels, Nuclear energy, Main components of nuclear power plant, Nuclear reactors types and applications, Radiation shielding, Radioactive and waste disposal safety aspect. [8]

Outcome: The students shall develop an insightful knowledge to apply the basic laws and operating principles in various power plants.

Text Books:

1. Deshpande, M.V., "Power Plant Engineering", McGraw Hill, 4th Edition 2004.
2. Gupta B. R., "Generation of Electrical Energy", S. Chand Publications, 14th Edition, 2011.

Reference Books:

1. Wood A.J. & Wallenberg B.F, "Power Generation and Control", John Wiley & Sons, 2nd Edition, 2012.
2. P.K Nag "Power Plant Engineering", McGraw Hill publications, 2nd Edition, 2008.
3. Arora S.C & Domkundawar S, "A course in Power Plant Engineering", Dhanpat Rai, 2nd Edition, 2002.

EE-14.310 **Reliability of Electrical Power System** **Total Lectures: 40**
3-0-0-3

Objective: This course facilitates the students to get a comprehensive exposure to the concept of probability theory, distribution, network modeling and reliability analysis.

Pre-requisite: Power system analysis, Power system transmission and distribution, Matrices, Probability and Calculus.

1. **Review of Probability Theory:** Element of probability theory Probability Distribution, Random variable, Density and distribution functions. Mathematical expectation. Binominal distribution, Poisson distributions, Normal distribution, Exponential distribution, Weibull distribution.. [8]
2. **Reliability of Engineering Systems**:Component reliability, Hazard models, Reliability of systems with non-repairable components, series, Parallel, Series-Parallel, Parallel-series configurations. Non-series-parallel configurations, minimal tie-set, minimal cut-set and decomposition methods. Power System reliability. [8]
3. **Reliability of Engineering Systems**:Reliability model of a generating unit, State space methods, Combing states, sequential addition method, Load modeling, Cumulative load model, merging of generation and load models, Loss of load probability, Percentage energy loss, Probability and frequency of failure, Operating reserve calculations. [8]
4. **Power Network Reliability:** Weather effect on transmission lines, Common mode failures, Switching after faults, three, state components, Normally open paths, Distribution system reliability. [8]
5. **Composite System Reliability:** Bulk Power supply systems, Effect of varying load, Inter connected systems, correlated and uncorrelated load models, Cost and worth of reliability. [8]

Outcome: The students shall have a thorough understanding of the main principles in power system reliability analysis as well as knowledge of different methods and tools for reliability analysis.

Text Books:

3. J. Endreny, "Reliability Modeling in Electric Power Systems", John Wiley & Sons. 1980
4. Roy Billinton& Ronald, N allan, "Reliability Evaluation of Power Systems", Plenum Press, New York. 1990

4. Patrick O'Connor, Andre Kleyner"Practical Reliability Engineering", Wiley 5th Edition,2012

EE-17.419 **Power System Protection** **Total Lectures: 40**
3-1-0-4

Objective: To provide a broad coverage on all types of protective relays, circuit breakers and its working for practical power system protection system.

Pre-requisite: Electrical Machines & Power Plant Engineering

1 **Introduction to Protection System:** Introduction to protection system and its elements, functions of protective relaying, protective zones, primary and backup protection, desirable qualities of protective relaying, basic terminology. [4]

2 **Operating Principle and Relay Characteristics:** Electromagnetic relays, thermal relay, gas actuated relay. Amplitude and phase comparators, over current relays, directional relays, distance relays, differential relay. [8]

3 **Static Relays:** Comparison with electromagnetic relay, classification and their description, over current relays, directional relay, distance relays, differential relay. [6]

4 **Protection of Transmission Line:** Over current protection, distance protection, pilot wire protection, carrier current protection, protection of bus. [6]

5 **Apparatus Protection:** Protection of Transformer, Generator and Motor. [3]

6 **Circuit Breaking:** Properties of arc, arc extinction theories, re-striking voltage transient, current chopping, Resistance switching, capacitive current interruption, short line interruption, circuit Breaker ratings, [6]

7 **Circuit Breaker:** Operating modes, selection of circuit breakers, ratings of circuit breaker, constructional features and operation of Bulk Oil, Minimum Oil, Air Blast, SF6, Vacuum circuit breakers, HVDC circuit breaker, Testing of Circuit Breaker. [7]

Outcome: After completion of the course, students would be able to apply the knowledge of CB, various relaying schemes and overvoltage and protection against overvoltage.

Text Books:

1. Badri Ram and Vishwakarma, D.N., "Power System Protection and Switchgear", McGraw HillPublishing, 3rd Edition, 2001.
2. Ravindranath, B. and Chander, N., "Power System Protection and Switch Gear", New AgeInternational (P) Ltd,3rd Edition, Reprint 1996.

Reference Books:

1. Sunil S.Rao, "Protective Switch Gear", Khanna Publishers, 2nd Edition, 2000.
2. Y. G. Paithangar, "Fundamentals of power system protection", PHI Learning Private Limited, 4th Edition, 2010.

EE-14.403 **Electric Drives and Control** **Total Lectures: 40**

3-1-0-4

Objective: This course aims to equip the students with a basic understanding of Electric drive system and their controls. The course also equips students with ability to understand selection of motor for industrial drive applications, and develops the ability to understand the characteristics and speed control of motors using power electronics based circuits.

Pre-requisite: Power Electronics, Electrical Machines and Control System.

1 **Introduction :**Introduction to an electric drive system, parts of electric drive system, choice criteria for drive system [5]

2 **Dynamics of Electric Drives:** Dynamic equations of an electric drive, torque equations, multi-quadrant operation, type of loads, energy loss during transients and load equalization. [5]

3 **Electric Drive Control:** Control of electric drives, modes of operation, speed control, open & closed loop drives, current limit control, torque limit control, position, PLL and speed control. [6]

4 **Selection of Motor Drive Rating:** Selection of motor rating – thermal model of motor, classes of duty and determination of motor rating for different classes of drive operation duty. [6]

5 **Control of DC Motor:** DC motor drive – starting, braking, transient analysis, speed control, controlled rectifier converters for DC drives and chopper fed DC drives. [9]

6 **Control of AC Motors:** Induction motor drive – starting, braking, transient analysis, speed control, Control of Induction Motor by AC Voltage controllers-Waveforms, Speed torque characteristics, Variable frequency control of induction motor by Voltage Source, Current Source inverters and cycloconverters. [9]

Outcome: After completion of the course, students would be able to apply the knowledge of various drives, their selection criteria and its control mechanisms for domestic and industrial applications.

Text Books:

1. Dubey G.K. “Fundamentals of Electrical Drives”,Narosa Publications, New Delhi, 2nd Edition 1995.
2. Gopal K. Dubey, “Power semiconductor Controlled Drives”, PHI publications, Newest 1st Edition 1989.

Reference Books:

1. Murphy J. M. D., Turnbull F.O., “Power Electronic Control of AC motors”, Pergamon Press, 1st Edition 1988.
2. Pillai S.K., “A first course on Electrical Drives”, New age International Publisher, 2nd Edition 1989.
3. U. A. Bakshi, M. V. Bakshi, “Electrical Drives and Controls”, Technical Publications Pune, 1st Edition 2009.

EE-14.441 **Engineering Economics** **Total Lectures: 26**

2-0-0-2

Objective(s):
1. Provide students with fundamental concepts of engineering economics.
2. Provide students with economical methods to compare and evaluate alternatives based on present, annual, rate of return, and benefit over cost analyses.
3. Emphasize practical engineering-based applications and the use of real data examples.

Prerequisite(s): Nil

1. **Introduction**: Definitions, Scope; Microeconomics vs. Macroeconomics; Engineering and engineering economics; Principles of engineering economics. **[2]**
2. **Theory of Demand & Supply**: Determinants, law of demand, law of supply, equilibrium, elasticity of demand. **[3]**
3. **Economics Applied to Industries**: Theory of production; production function, Law of variable proportions, Returns to scale, Theory of cost; Various concepts of cost: Fixed cost, variable cost, average cost, marginal cost, money cost, real cost, opportunity cost, average cost, marginal cost, total cost etc, Break even analysis. **[6]**
4. **Market Structures& Pricing Techniques:** Meaning of Market, Types of Market- perfect competition, Monopoly, Oligopoly, Monopolistic Competition (Main features of these markets). **[5]**
5. **Replacement analysis and depreciation**: Replacement Analysis Decision Map, Basic aspects of depreciation, Deterioration & Obsolescence, and its methods **[3]**
6. **Optimization technique**: Optimization under constraints and without constraints, optimal resource allocation, optimization under risk and uncertainty. **[4]**
7. **Capital budgeting**: Concept; under certainty and uncertainty, Techniques; Discounting &compounding techniques, IRR, NPV, PBP, Profitability index, Accounting rate of return. **[3]**

Outcome(s):
1. Understand major principles of economic analysis for decision making among alternative courses of action in engineering.
2. Apply cost estimation and alternative analysis techniques for engineering applications.
3. Recognize the economic impact of engineering solutions.
4. Calculate depreciations and understand the impact of inflation.
5. Perform breakeven analysis for a single project and between two alternatives.

Text Books:

1. Salvatore, Dominick. Managerial Economics, Prentice Hall of India, 6th Ed., 2010.
2. D.N. Dwivedi, Managerial Economics, Oxford University Press,Vikas Publication, 7th Ed., 2014.

Reference Books:

1. Suma Damodran, Managerial Economics, Oxford University Press, 2nd Ed, 2005.

EE-14.405 **Electrical Machine Design** **Total Lectures: 42**

3-1-0-4

Objective: To provide knowledge of design aspects of various dc machines, ac machines and transformers.

Pre-requisite: Electrical Machines

1 **Fundamentals of Electrical Machine Design:** Standard specification of frame size, conductors and insulation, Magnetization and loss curves, Choice of specific loadings Heating and cooling of electrical machines. [6]

2 **D.C Machines:** Construction details, output equation, main dimensions, Choice of specific loadings, choice of number of poles, armature design, design of field poles and field coils ,design of commutator and brushes. [10]

3 **Transformers:** Construction details of core and shell type transformers, output rating of single phase and three phase transformers, optimum design of transformers, design of yoke, core and winding for core and shell type transformers, equivalent circuit parameters from design data and design of tank and cooling tubes of transformers. [10]

4 **A.C. Machines:** Construction details of A.C. machines, output equation, main dimensions, Choice of specific loadings, design of stator, design of squirrel cage and slip ring rotor equivalent circuit parameter from design data, Short circuit ratio, design of rotor of cylindrical pole and salient pole machines. [10]

5 **Computer Aided Design:** Need for computer aided design, Analysis method, Synthesis method, Introduction to analysis of Electric machine parameters using FEM. [6]

Outcome: After completion of the course, students would be able to apply the knowledge of magnetism in the design of transformer and rotating electrical machines.

Text Books:

1. A.K. Sawhney, A course in Electrical Machine Design, DhanpatRai and sons, New Delhi, 2nd Edition, 2002.
2. S K Sen, Principles of Electrical Machine Design with Computer Programme,Oxford and IBH publishing Co. Pvt Ltd., New Delhi, 3rd Edition, 2004.

Reference Books:

1. R.K Agarwal, Principles of Electrical Machine Design, S.K.Katariasons, New Delhi, 4th Edition, 2002.
2. V.N. Mittle and A. Mittle, Design of Electrical Machines, Standard Publications and Distributors, Delhi, 3rd Edition, 2002.

EE-14.421 **Power Systems Laboratory**

0-0-2-1

Objective: To develop understanding of power system equipment and protective relays used in power system.

Pre-requisite: Power System Protection, Transmission and Distribution

6. To study and testing the operation Gas actuated Buchholz Relay.
7. To study and testing of IDMT type Over current Relay with different and time setting & draw characteristics.
8. To study and testing of under voltage relay with different voltage setting multiplier & plot IDMT characteristics.
9. To study and testing of under frequency relay with IDMT characteristics.
10. To study and testing of microcontroller based Earth Fault relay with IDMT and DMT mode.
11. To study and testing the operating characteristics of percentage-biased differential relays and plot the characteristics of percentage biased differential relay for 30%, 40%, & 20%.
12. Draw I-V and P-V characteristics of PV panel by variable resistive load and find out maximum power point by FF calculation.
13. Draw I-V and P-V characteristics of PV panel by varying duty cycle with constant resistive load.
14. Develop a MPPT algorithm for tracking maximum power by analyzing I-V & P-V characteristics of PV panel.
15. Use buck-boost converter for MPPT controller and find out total efficiency of the system.
16. To Measure sending and receiving end line parameters of short/medium/long transmission line and Modeling of transmission line model.
17. To compute of line parameters and Modeling of Transmission Lines using MATLAB.
18. Simulation of load Flow analysis and related problems using Newton-Raphson and Fast-Decoupled methods using MATLAB.
19. Simulation of transient and small signal stability analysis: single-machine Infinite Bus System using SIMULINK.
20. Transient Stability Analysis of Multi-machine Power Systems using MATLAB.

Outcome: The students will develop an insightful knowledge on various protective relays, smart grid and MATLAB simulation.

Text Books:

1. Wadhwa C.L., Electrical Power Systems Electronics, New Age International Publishers, 4th Edition, 2011.
2. Sunil S. Rao, Switchgear and Protection, Khanna publishers, 3rd Edition, 2001.

Reference Books:

1. Uppal, S.L., Electric Power, Khanna Publishers, 13th Edition, 2008.

EE-14.423 **Advanced Electrical Simulation Laboratory**

0-0-2-1

Objective: To enhance the model building, advanced analyzing and problem solving skills of the students in the area of power system, power electronics and control through computer programming and simulation.

Prerequisites: Fundamentals of power system power electronics and control system.

1. Building a One-Line Diagram of conventional power system and study of various power system components.
2. Building a simulation model of power system with renewable like solar and wind.
3. Calculation of Transmission Line Parameters.
4. Real and Reactive Power Computation for a given power system.
5. Load flow analysis.
6. Simulation of various faults and short circuit analysis for a given power system.
7. Simulation and study of various power quality events like voltage sag, harmonics and transients etc.
8. Developing a simple simulation models for harmonic filter in power system distribution lines.

Outcome: Upon completion of the course students will be able to

1. Develop computer programs for advanced power system studies.
2. Develop computer models for power system components.
3. Simulate and visualize the real time phenomenon.

Text Books:

1. Nagrath I. J.& Kothari D. P., "Modern Power System Analysis", McGraw Hill Education Private Ltd, 11th Edition, 2014.
2. Pai M. A,"Computer Techniques in Power Systems Analysis", Mc Graw Hill Publication Company Ltd, 2nd Edition, 1979.

Reference Books:

1. Kusic G.L, "Computer Aided Power Systems Analysis", CRC Press, 2nd Edition, 2008.

EE-14.433 **Industrial Training Seminar**

0-0-0-2

Industrial training plays a very important role for engineering graduates of all disciplines. As an engineering student, training can help to implement the concepts that students have learnt in their classes.

Objective: To enhance the knowledge of the students on different cutting edge technologies which have become important part of respective industries.

Pre-requisite: Nil

Industrial training offers the following:

1. Experience of industrial environment/conditions to girls students.
2. Enable the students to learn engineering techniques by observation and practice.
3. Show how theory presented in class is applied in practice.
4. Provide contact with practicing engineers.
5. Familiarize the student with practices and problems faced by companies employing engineers.
6. Give the student the responsibility of completing a piece of work.
7. Enable and accord industry opportunity to shape and participate in the development of future human resources

Outcome and Assessment:

1. Ability to acquire and apply fundamental principles of science and engineering.
2. Capability to communicate effectively.
3. Ability to identify, formulate and model problems and find engineering solution based on a systems approach.
4. Ability to conduct research in the chosen fields of engineering.
5. Understanding of the importance of sustainability and cost-effectiveness in design and developments of engineering solution.
6. Ability to be a multi-skilled engineer with good technical knowledge, management, leadership and entrepreneurship skills.
7. Awareness of the social, cultural, global and environmental responsibility as an engineer.
8. Capability and enthusiasm for self-improvement through continuous professional development and life-long learning.

EE-14.442 **Principles and Practices of Management** **Total Lectures : 26**

2-0-0-2

Objective(s):

1. To expose the students to fundamental concepts of management and its processes in organizations.
2. To describe the various skills necessary for effective managers.
3. To explain the Individual and Group Behavior along with various leadership Styles

Prerequisite(s): Nil

1. **Planning and Organizing:** Management: Concept, Nature and functions; Planning: Concept, Missions, Objective and Strategies, Steps in Planning; Organizing: Concept, Formal an Informal Organization, Decentralization of Authority, Delegation of Authority, Principles of Organizing, Line and Staff Authority. **[5]**
2. **Staffing and Controlling:** Staffing: Definition, Recruitment, Selection, Placement, Promotion, Separation, Performance Appraisal; Controlling: Concepts and Process, Controlling as a Feedback System, Requirements for Effective Control. **[4]**
3. **Motivation:** Concept; Theories and Process of Motivation: Maslow's Need-Hierarchy Theory, Herzberg's Hygiene Theory, Goal-Setting Theory, Vroom's Expectancy Theory. **[4]**
4. **Personality:** Concept and Determinates, Types and Traits, Personality Attributes Influencing Organizational Behavior, Locus of Control, Machiavellianism, Self-Esteem, Self-Monitoring, Risk-Taking. **[3]**

5 **Group Behavior and Interpersonal Relationship:** Groups: Concept and Classification, Stages of Group Development, Roles and Norms, Group Decision-Making: Group versus Individual, Group Decision Making Techniques and Process, Interpersonal Relationships, Understanding Self and Others, Developing Interpersonal Relationships, Transactional Analysis, Johari Window. **[6]**

6. **Leadership:** Concept and Functions; Theories of Leadership: Traits, Behavioral, Situational/Contingency; Inspirational approaches to Leadership: Charismatic Leadership, Transformational Leadership, Transactional Leadership, and Contemporary Leadership. **[4]**

Outcome(s): By studying this Course, students would be able to understand various Management functions, individual and group behavior. They would also know various styles of Leadership and its applicability. The course would help the students in understanding various organizational contexts and help them understand organizational systems in a better way.

Text Books:

1. Koontz, Harold and Weihrich, Heinz, Essentials of Management: An International, Innovation and Leadership Perspective, McGraw Hill Private Limited, India, 10th Edition, 2015.
2. Robbins, Stephen P., Timothy Judge and Neharika Vohra, Organizational Behavior, Pearson Education, 12th Ed., 2011.

Reference Books:

1. Prasad L. M., Principles and Practice of Management, Sultan Chand & Sons, 9th Edition, 2015
2. Fred Luthans, Organizational Behavior, McGraw Hill, 11th Ed., 2009

EE-14.434 **Technical Seminar**

0-0-0-2

Objective:

1. To encourage the students to study advanced engineering developments and state-of-the-art activities.
2. To develop skills to prepare technical report writing and presentation.
3. To encourage the students to use various teaching aids such as overhead projectors, power point presentation and demonstrative models.

During the seminar session each student is expected to prepare and present a topic on engineering/ technology, for duration of about 10 to 15 minutes. The performance of the student will be evaluated based on slide preparation, presentation, ability to address question, etc. At the end of the semester, she will have to submit a technical report on her topic of seminar.

Outcome:

1. Ability to review, prepare and present technological developments
2. Ability to face the placement interviews

EE-14.411 **Smart Grid** **Total Lectures: 40**

3-0-0-3

Objective:
- This course aims to equip the students to understand the change in electricity power business from conventional sectors to smart grid sectors.
- To understand and analyze the basic architecture of smart grid and functions of its various components like renewables generation, measurement and communication system etc.

Pre-requisite: Power system , Electrical Measurement & Instrumentation

1 **The Traditional Power Generation and Transmission System:** Introduction, Power System reliability and quality, Voltage profile of power system, Power transfer Through radial feeder, Power system stability and control, Protection system, SCADA System. [8]

2 **Smart Grid:** Introduction, Characteristics of Smart Grid, Traditional Grid Versus Smart Grid, Evolution of Smart Grid, Components of Smart Grid, The Environmental Impacts of Smart Grid, Technologies Required for Smart Grid. [8]

3 **Renewable Energy Integration:** Introduction, Solar Energy, Wind Energy, Distributed Energy Resources Integration Challenges, Forecasting and Scheduling, Impacts of Renewable Energy into the Grid. [8]

4 **Smart Grid Communications and Measurement Technology:** Communication, Measurement and Monitoring Technologies, Wide Area Monitoring Systems (WAMS), Phasor Measurement Units (PMU) ,Smart Appliances, Advanced Metering Infrastructure (AMI),Communication Protocols. [10]

5 **Smart Meter:** Details Description of Smart Meter, Benefits of Smart Meter, Technical Configurations of Smart Meter, Components of Smart Meter Network in Distribution System, and Characteristics of smart meters. [6]

Outcome: Upon completion of the course the student will be able to:

1. Understand the difference between conventional grid and smart grid.
2. Understand the integration necessity and challenges of renewable in conventional grid system.
3. Understand the operation of communication and measurement technology in modern grid context.

Text Books:

1 Momoh James., "Smart Grid Fundamentals of Design and Analysis" ,John Wiley &Sons, Inc., Hoboken, New Jersey, 4th Edition, 2012

2 Bollen, Math and Hassan F, "Integration of Distributed Generation in The Power System", IEEE press, 2011.

Reference Books:

1 Shawkat Ali A. B. M., "Smart Grids Opportunities, Developments and Trends", Springer Verlag, London, 4th Edition, 2013.

2 Chowdhury S., Crossley P. "Microgrids and Active Distribution Networks" The Institution of Engineering and Technology, UK, 3rd Edition, 2009.

EE-14.413 **Modern Control System** **Total Lectures: 40**

3-0-0-3

Objective: To impart knowledge about advances in control system in the areas of state-space modeling & stability of continuous & discrete system. It will also make students familiar with the non-linear system – their modeling and analysis. At the end of the course a student will be equipped to handle linear and non-linear control problems.

Pre-requisite: Linear Control System

1 **State Space Analysis of Continuous Time Systems**: State variable representation – Conversion of state variable form to transfer function and vice versa – Eigenvalues and Eigenvectors – Solution of state equation – Controllability and observability –Pole placement design – Design of state observer [8]

2 **Z-Transform and Sampled Data Systems:** Sampled data theory – Sampling process – Sampling theorem – Signal reconstruction –Sample and hold circuits – z-Transform – Theorems on z-Transforms – Inverse z-Transforms – Discrete systems and solution of difference equation using z transform – Pulse transfer function – Response of sampled data system to step and ramp Inputs – Stability studies –Jury's test and bilinear transformation. [6]

3 **State Space Analysis of Discrete Time Systems**: State variables – Canonical forms – Digitalization – Solution of state equations –Controllability and Observability – Effect of sampling time on controllability – Pole placement by state feedback – Linear observer design – First order and second order problems [6]

4 **Nonlinear Systems:**Types of nonlinearity – Typical examples – Phase-plane analysis – Singular points – Limit cycles – Construction of phase trajectories – Describing function method – Basic concepts –Dead Zone – Saturation – Relay – Backlash – Liapunov stability analysis – Stability in the sense of Liapunov – Definiteness of scalar functions – Quadratic forms – Second method of Liapunov – Liapunov stability analysis of linear time invariant systems and non-linear system [6]

5 **MIMO Systems:**Models of MIMO system – Matrix representation – Transfer function representation – Poles and Zeros – Decoupling – Introduction to multivariable Nyquist plot and singular values analysis – Model predictive control. [5]

Outcome: Upon completion of the course the student will be able to develop the mathematical models for various types of systems using different techniques.

Text Books:

1. M. Gopal, "Digital Control and State Variable Methods", McGraw Hill Publication,4th Edition, 2012.
2. Katsuhiko Ogata, "Modern Control Engineering", Prentice Hall, 3rd Edition, 1997.

Reference Books:

1. Katsuhiko Ogata, "Discrete-Time Control Systems", Pearson Education, 2nd Edition, 2002.
2. Richard C. Dorf and Robert H., "Modern Control Systems", 8thEdition, PearsonEducation, 2004.

EE-14.415 **Power Quality** **Total Lectures: 40**

3-0-0-3

Objective: This course aims to equip the students with an understanding of emanation of various power quality disturbances their cause, effects and remedial action in particular to harmonics distortion.

Pre-requisite: Power system, Power Electronics

1 **Introduction:** Introduction, power quality -voltage quality, power quality evaluations procedures term and definition:general classes of power quality problem, causes & effect of power quality disturbances. [6]

2 **Voltage Sags and Interruption:** Voltage sags and interruption: sources of sags and interruption, estimating voltages sag performance, fundamental principles of protection, monitoring sags. [6]

3 **Transient Over Voltages:** Sources of transient over voltages, principles of overvoltage protection, devices for overvoltage protection, utility capacitor-switching transients, utility system lightning protection, managing ferro-resonance , switching transient problems with loads. [8]

4 **Harmonics:** Harmonic distortion, voltage versus current distortion, harmonics versus transients, harmonic indexes, harmonic sources from commercial loads, harmonic sources from industrial loads, locating harmonic sources, system response characteristics, effects of harmonic distortion, inter-harmonics. [10]

5 **Applied Harmonics:** Harmonics distortion evaluations, principles for controlling harmonics, harmonics studies devices for controlling harmonic distortion, filters, passive input filter standards of harmonics. [10]

Outcome: Upon completion of the course The student will be able understand

1. The reason for occurrence of power quality disturbances.
2. The difference between disturbing signals like sag, swell transients, harmonics.
3. Various types of filters to filter out the harmonic problems.

Text Books:

1. Dugan R. C.,"Electrical Power System Quality", McGraw Hill Publication, 3rd edition, 2008.
2. Arrillga A.J., "Power System harmonics", Wiley publication, 2nd edition, 2003.

Reference Books:

EC-14.413 **FPGA Architecture and Applications** **Total Lectures: 40**
3-0-0-3

Objective: To acquire fundamental knowledge of designing and implementation of digital systems in programmable logic devices using CAD tools.

Pre-requisite: EC-14.203 Digital Electronics, Knowledge of Computer Architecture

1. **Digital System Design:** Moore and Mealy circuits, Design procedure of combinational and sequential systems, State table and State reduction [8]
2. **PLD Programming Technologies:** EPROM, EEPROM, Anti-Fuse, SRAM Programmable Logic Devices (PLD): ASIC, ROM, PLA, PAL and CPLD – Architecture and applications, advantages and disadvantages of ASIC and PLD based design. [9]
3. **FPGAs:** Evaluation of FPGA, Internal Structure of FPGA: Logic blocks, I/O Blocks, Routing technique, Clock resources and switch technologies. Case studies Xilinx XC4000 and ALTERA's FLEX 8000/10000 FPGA, Differences in Xilinx, Altera, Actel and Quicklogic FPGAs and Advanced FPGAs [14]
4. **Front End Digital Design Tools for FPGAs:**Role of VHDL in FPGA based design, review of VHDL constructs, FPGA design flow using Xilinx Integrated Software Environment, Simulation tool, Synthesis tool. Place and Route tool [9]

Outcome: After completion of the course, students would be able to:

1. Identify, formulate, and solve engineering problems
2. To use the technique, skills, and modern engineering tools necessary for engineering practice.

Text Books:

5. Mano, M.M., "Digital Design", PHI, New Delhi, 2nd Edition, 2001.

EE-14.404 **Renewable Energy Systems** **Total Lectures: 40**

3-0-0-3

Objective: This course provides the principles of renewable technologies for sustainable future. It also provides the details of renewable resources, energy conversion techniques and applications of solar, wind, biomass, geothermal, hydro-electric, wave and tidal energy technologies.

Pre-requisite: Power Plant Engineering

1 **Energy Scenario:** Energy Resources: Conventional and non-conventional, Energy needs of India, Energy consumption patterns, Worldwide Potentials of these sources, Energy efficiency, Energy security, Energy and its environmental impacts, Global environmental concern, Kyoto Protocol, Concepts of Clean Development Mechanism (CDM) and Prototype Carbon Funds (PCF),Factors favoring and against renewable energy sources. [8]

2 **Solar Energy:** Solar Energy basics-Extraterrestrial and Terrestrial radiation, Spectral energy distribution, Solar Radiation Geometry, Empirical equation for estimating solar radiation on horizontal surface. Solar Thermal Systems, Types of collectors-Concentrating and Flat plate, Efficiency calculations, Solar water heater- thermosiphon and pumped, Greenhouses heating and cooling, Photo Voltaic (PV) technology, Solar cells, Characteristic of PV systems, Equivalent circuit, Array design, Standalone and grid interactive system. [8]

3 **Wind Energy:** Wind Energy, Wind speed and power relation, Power extracted from wind, Wind distribution and wind speed predictions, Wind power systems, System components, Types of turbine, Turbine rating, Variable speed operation, Maximum power Operation, Control systems, System design features, Standalone and grid connected operation. [8]

4 **Other Energy Sources:** Biomass, Various resources, Energy contents, Technological advancements, Conversion of biomass in other form of energy, solid, liquid and gases, Gasoliers, Biomass fired boilers, Co firing, Energy Generation from agro-dairy apart from municipal waste ,used for vehicles , Hydro energy, Feasibility of small, mini and hydel plants: scheme, layout and economics, Tidal and wave energy, Geothermal and Ocean, Thermal Energy Conversion (OTEC) systems, Schemes, feasibility and viability [8]

5 **Energy Storage and Hybrid System Configurations:** Energy storage, Battery, Types, Equivalent circuit, Performance characteristics, Battery design, Charging and charge regulators, Battery management, Fly wheel energy relations, Components, Benefits over battery,Fuel cell energy, Storage systems and Ultra capacitors, Energy Management. [8]

Outcome: Upon completion of this course, the students should be able to:

1. Recognize the need of renewable energy technologies and their role in the world energy demand.
2. Distinguish between the sustainable energy sources and fossil energy sources
3. Describe the principles of renewable energy production from various renewable sources.

Text Books:

1. Rai G.D. "Non- Conventional Energy Sources", Khanna Publishers, 4th Edition,2004.
2. Khan B.H., "Non-Conventional Energy Resources",McGraw-Hill Education Private Limited, 2nd Edition, 2015.

Reference Books:

4. Kothari D.P. and Singal K.C. "Renewable Energy Sources and Emerging Technologies", PHI Learning Private Limited, 2nd Edition, 2011.
5. Boyle, G. "Renewable energy: Power for a sustainable future" Oxford University press, 3rd Edition, 2014.

EC-14.306 **Microcontroller and Embedded Systems** **Total Lectures: 40**

3-0-0-3

Objective: The objective of this course is to teach students design and interfacing of microcontroller-based embedded systems. The course covers fundamentals, The 8051 Architecture, Assembly Language Programming, Instruction set, Serial Communication and Interfacing techniques of 8051 Microcontroller.

Pre-requisite: Programming skills and fundamental knowledge of microcontrollers, microprocessors and digital design.

1. **Introduction to Microcontrollers, Architecture and Memory Interfacing:** [7] Overview of the 8051 family, 8051 Microcontroller's Architecture, Pin configuration, Common memory types and Tradeoffs, External Memory interfacing.
2. **Programming of 8051:** Addressing modes of 8051, instruction set of 8051, assembly language programming of 8051, stack structure of 8085, delays, and subroutines, Applications of interrupts, timer/counter and serial port, Components of Integrated Development Environment for software development. [16]
3. **Interfacing of 8051:** Interfacing of 8051 with sensors, Keyboard, ADC, DAC, LCD, Stepper Motor and D.C motor. [8]
4. **Introduction to Embedded systems and Processors:** Introduction and Examples of Embedded Systems, Concept of Embedded System. Design challenge, Processor technology, IC technology, design technology, Trade-offs: Custom single purpose processor hardware, general-purpose processor: introduction, basic architecture, operation, super-scalar architecture, application specific instruction set processors, microcontrollers, digital signal processors, selection of embedded processor. [6]
5. **Software Aspect of Embedded System:** Challenges and issues in embedded software development, Software and hardware requirements, Real time system, Real time operating systems, Kernel, architecture: mutex, semaphore, testing and verification. [3]

Outcome: Upon completion of this course, the student will be able to:

1. Program, build and test a microcontroller system.
2. Interface a microcontroller system to user controls and other electronic systems.
3. Describe the internal architecture of microcontroller systems, including counters, timers, ports, and memory.
4. Understand and design embedded systems and real-time systems.
5. For real-time systems:
   - Identify the unique characteristics of real-time systems.
   - Explain the general structure of a real-time system.
   - Define the unique design problems and challenges of real-time systems.

Text Books:

1. M. A. Mazidi, "The 8051 Microcontroller & Embedded Systems", Pearson Education, 2nd Edition, 2007.
2. I. Scott McKenzie and Raphael C.W. Phan,"The 8051 Microcontroller" Pearson Education, 3rd Edition, 2012.

Reference Books:

1. David E Simon, "An Embedded Software Primer",Pearson Education Asia, 12th Edition, 2005.

2. Raj Kamal, "Embeded System", Mcgraw-Hill. 2nd Ed., 2011.

EE-14.412 **EHV AC & DC Transmission** **Total Lectures: 40**
3-0-0-3

Objective: To provide an in-depth understanding of the different aspects of Extra High Voltage A.C. and D.C. Transmission system design and Analysis.

Pre-requisite: Transmission & Distribution & Power System Analysis

1. **EHV AC System:** Flexible AC transmission, control of FACTS devices, reactive power planning, static VAR compensation, optimal location, Sub-synchronous resonance, Ferro-resonance, true saturation characteristic. [6]
2. **Transients in Three Phase EHV AC system:** Switching of three phase transformer banks, transmission lines, capacitive banks, effects of neutral connection. Symmetrical component method of analysis of three phase switching transients, effect of open conductors. EMTP application. [6]
3. **Traveling Waves:** Generation of traveling waves, refraction and attenuation of waves, effects of line terminators, multi-conductor systems. [6]
4. **Protection of EHV AC Lines:** Protection against switching over-voltages, lightning over-voltages. Surge diverters, surge capacitors and reactors, overhead ground wires. [6]
5. **HVDC Systems:** Comparison with AC systems. Various configurations, inversion and conversion, operation and control, harmonics and filters. Parallel operation of HVDC/AC system. Back to back connections. Multi-terminal HVDC system. Transients in HVDC converters. [6]
6. **Overvoltage and Insulation Coordination:** Lightning, switching and temporary overvoltage, BIL and SIL, methods of insulation coordination, conventional and statistical methods. [6]
7. **Gas Insulated Systems:** Gas Insulated lines, substations, advantages and problems. [4]

Outcome:
1. Understand issues of concern with EHVAC& DC transmission
2. identify and calculate the various parameters of EHV line for modeling
3. Estimate the over–voltages in EHV AC systems and protect against it.
4. Understand insulation coordination and gas insulated system.

Text Books:
1. Rakesh Das Begamudre, "Extra High Voltage Ac Transmission Engineering", New Age International, 4th Edition, 2011.
2. Padiyar. K. R.,"HVDC Power Transmission Systems", New Academic Science, 2nd Edition, 2011

Reference Books:
1. A Chakraborti, D.P. Kothari "Performance, Operation and Control of EHV Power Transmission Systems", T.M.H publication,2nd Edition, 1983.
2. TuranGonen "Electric Power Transmission System Engineering",Taylor & Francis, 2nd Edition,2007.

EE-14.414 **Computer Application in Power Systems** **Total Lectures: 40**
3-0-0-3

Objective: This course is designed to give students the required knowledge for the design and analysis of electrical power grids by using computer programs or a software. The computer programs or software make easy calculation of power flow in a power system network using various techniques.

Pre-requisite: Transmission & Distribution & Power System Analysis

1 **Network Modeling**: Development of network matrices using graph theory, Z-Bus and Y-Bus formation, component models, fixed tap, variable tap and phase shifting transformers. [5]

2 **Short Circuit Studies of Large Systems:** Symmetrical and asymmetrical fault analysis using Z-Bus and Y-Bus Method. [6]

3 **Advanced Load Flow Studies:** Load models, non-convergence of load flow solutions, remedial measures, second order methods, continuation power flow, sparse vector method. [8]

4. **Economic Operation and Security Analysis:** Optimal power flow problem and its solution methods, contingency evaluation methods; distribution factors, direct and indirect methods, contingency ranking and screening. [8]

5. **Angular and Voltage Stability Analysis:** Steady state and transient stability, mathematical models and numerical solution, voltage stability. [8]

6. **State Estimation:** Algorithm, tracking state estimator, bad data identification, Observability. [5]

Outcome:
1. Upon completing this course student able to analysis of different type fault in a power system by computer methods.
2. Student able to apply computer methods in different load flow techniques.

Text Books:

1. J.J.Grainger & W.D.Stevenson, "Power system Analysis",McGraw Hill, 3rd Edition, 2007.
2. HadiSaadat, "Power System Analysis",McGraw Hill ,2nd Edition, 2002.

Reference Books:

1. D.P.Kothari and I.J.Nagrath, "Modern power system analysis", McGraw HillEducation, 2nd Edition, 2003.
2. T.K.Nagsarkar M.S.Sukhija ,"Power System Analysis", OXFORD university press,4th Edition, 2007.

CS-14.305 **Logic in Computer Science** **Total Lectures: 40**

3-0-0-3

Objective:

1. To introduce the main notions of mathematical logic: logical notations (syntax) and how to assign meaning to them (semantics).
2. To study formal frameworks (in the sense of being rigorous as well as in the sense of manipulating "form") for constructing logical arguments (proof theory).
3. To study some deductive systems for propositional and first-order logic.
4. To introduce the concept of fuzzy logic.

Pre-requisite: CS-14.201(Discrete Structures), CS-14.207(Computer Information Systems)

1. **Introduction:** Role of logic in computer science, problem representation, review of the principle of mathematical induction, the principle of structural induction, review of Boolean algebra, language, models, interpretations, validity, proof, decision problems in logic, decidability. [6]
2. **Propositional Logic:** Syntax, semantics, logical and algebraic concepts, identities and normal forms, tautology checking, propositional un-satisfiability, propositional resolution and tableaux method. [10]
3. **First Order Predicate Logic:**Quantifiers, first order models, validity and satisfiability, forward and backward chaining, skolmization, normal forms, unification, Horn formulas and programs, resolution and tableaux. [12]
4. **Binary Decision Diagrams:**Representing Boolean functions, algorithms for ordered reduced binary decision diagram (OBDD), geometric templates from spatial relations, image based rendering, symbolic model checking, relational Mu-calculus, coding CTL models and specification. [8]
5. **Fuzzy Logic:**Classic sets, fuzzy sets and membership, fuzzy set operations, Cartesian product, operations and properties of crisp relationship, operations and properties of fuzzy relationship. [4]

Outcome: On successful completion of this course, the students will be able to

1. Use propositional and first-order logic.
2. Apply of logic in specifying properties.
3. Design binary decision diagrams.

Text Books:

1. Huth M and Ryan M, Logic in Computer Science: Modelling and Reasoning about Systems, Cambridge University Press, 2nd edition, 2004.
2. Enderton H B, A Mathematical Introduction to Logic, Academic Press, 2nd edition, 2001.

Reference Books:

.

CA 16.103 **C- Programming** **3-0-0-3**

Total Lectures: 40

1. **Introductory Concepts:** Introduction to computers, Computer characteristics, Types of programming languages, Introduction to C, identifiers and keywords, Data types: declaration and definition, Type conversion. [6]
2. **Operators:** Arithmetic, relational, logical, bitwise, unary, assignment, Increment and Decrement operators, conditional operators and their hierarchy, associativity, Data input/output. [8]
3. **Control Structure:** Introduction, Conditional Statements; Simple If-Else; Nested Statements, switch, Loops- For, While, Do-While; Break, Continue, Go-To Statements, Labels, Printf, Scanf function. [7]
4. **Array:** Defining an array, processing an array, passing arrays to functions, Multidimensional arrays, Arrays and strings. [6]
5. **Function and Pointer:** A brief overview, Defining a function, accessing a function, function prototypes, passing arguments to a function, recursion, Pointers: Declaration, operations on pointers, array of pointers, pointers to arrays. [7]
6. **Advance C Concepts:** Structure, Union, storage classes in C, Concept of files file access in different modes, reading from and writing into a file, Library Functions. [6]

Text Books:

1. Kernighan, Brain W. and Ritchie, Dennis M., "The C Programming Language," Second edition 2013, Pearson Education.
2. Gottfried ,Byron S. and Schaum's, "Programming with C," 2nd Edition, Tata McGraw-Hill, 2006.

Reference Books:

1 Schildt ,Herbert, "C: The Complete Reference," Fourth edition, McGraw- Hill Education, 2000.

2 Kanetkar ,Yashwant, "Let us C," Fifth Edition BPB Publication,2006.

3 Balagurusamy , E, "Programming in ANSI C," Tata McGraw-Hill Education.

CA 16. 101 **Computers Fundamentals** **3-0-0-3**

Total Lectures:40

1. **Introduction to Computers:** Definition, Block Diagram, characteristics, Applications in Modern Society, History, Classification of computers and Generation of computers. [6]
2. **Functional Units of Computer Processing System:** Hardware, CPU, Memory and secondary storage devices, Input devices, Output Devices, Information Concept and Processing: Data, Information, Knowledge and Wisdom. [8]
3. **Data representation:** Representation of Data, Bits and Bytes, Number System: Decimal, Binary, Octal, Hexadecimal, Conversions b/w number system, Arithmetic Operations in Binary Number, ASCII, EBCDIC and BCD Codes. [8]
4. **Software Concepts:** Types of Software, Generation of Programming Language: Machine Language, Assembly Language, High Level Language, Translator: Assembler, Interpreter, Compiler, Operating System**:** Functions, types of operating system: Batch Processing, Multiprogramming, Multiprocessing, Multitasking, Time Sharing and Real Time System, MS-DOS, MS-Windows. [9]
5. **Data Communication and Computer networks:** The Basic Communication System, Data Transmission Modes, Network types, Network Topologies, Internet and its Applications: E-mail, World Wide Web, Intranet, Extranet, Computer Threats: Virus, Worm, Trojan horse, Malware. [9]

Text Books:

1. Sinha , Pradeep K. and Sinha, Priti, "Computer Fundamentals", BPB Publications, Third Edition.

Reference Books:

1. ITL Education Solutions Limited, "Introduction to Computer Science", Pearson Education, Third Edition, New Delhi.
2. Rajaraman, V., "Introduction to Computer", PHI, New Delhi.
3. Thareja, Reema, "Fundamentals of Computers", Oxford University Press India, Second Edition.

Testing:

- One Dimensional Array
- Two Dimensional Array

Application programs based on above elements in different areas of computing like- Science, Business, Mathematics and other manual processes.

Testing:

- Implementation of Linked List
- Operations on Linked list

Application programs based on above elements in different areas of computing like- Science, Business, Mathematics and other manual processes.

Testing:

- Implementation of stack using array and Link List.
- Operations on stack.

Application programs based on above elements in different areas of computing like- Science, Business, Mathematics and other manual processes.

Testing:

- Implementation of Queue using array
- Operations on queue.

Application programs based on above elements in different areas of computing like- Science, Business, Mathematics and other manual processes.

Testing:

- Searching
- Sorting

Application programs based on above elements in different areas of computing like- Science, Business, Mathematics and other manual processes.

CA 16. 104 **Data Structures** **3-0-0-3**

Total Lectures:40

1. **Introduction**: Overview of data structure, types of data structures and operations. Applications of data structures [2]

2. **Pointer and dynamic memory allocation:** Pointer declaration and initialization, accessing a variable through its pointer, meaning and advantages of dynamic memory allocation, Memory allocation functions. [3]

3. **Array:** Representation of single and multidimensional array. [2]

4. **Sorting and Searching Techniques:** Insertion Sort, Selection Sort, Merge Sort, quick sort, Linear Search, Binary Search [8]

5. **Stack :** Definition and representation of stack, operations on stack, Infix, Postfix, Prefix Expressions, Conversion from Infix to Postfix (Algorithms only). [7]

6. **Queue**: Introduction and types of queues, Primitive Operations on Queues. [7]

7. **Linked List:** Introduction to Linked List, implementation of Linked List, operations on linked list: creation, deletion, search and display [7]

8. **Tree:** Introduction and Terminology, Traversal of Binary Trees [4]

Text Books:

1. Schaum Series, "Data Structures", TMH, New Delhi.

Reference Books:

1 Langsam , Augenstein and Tannenbaum, "Data Structure Using C and C++", PHI, New Delhi.
2 Horowithz and Sahani, "Fundamentals of Data Structure", Galgotia Book Source Pvt. Ltd. , New Delhi.
3 Kanitker Y., "Let us C", BPB Publication New Delhi.
4 Balagurusamy, E , "Programming in C", TMH, New Delhi.

CA 16. 108 **Digital Electronics** **3-1-0-4**

Total Lectures:40

1. **Number System:** Binary, octal, Hexadecimal Number, their addition and substraction, Base conversions, Number code: 8421, Other BCD codes, Grey, ASCII, EBCDIC. Boolean Algebra: Laws and theorems of Boolean algebra. De Morgan's theorem, XOR and XNOR gates, Half and Full Adder and Subtractor circuits. [10]
2. **Fundamentals**: Products, Sum of products and Product of sums, Form of Boolean expressions, Truth Tables and Karnaugh maps, pair reads octets and Karnaugh simplification. Mltiplexers BCD to Decimal to BCD decoders and, decoders' characteristics of digital integrated digitals. [10]
3. **Flip Flop:** RS Flip Flop, Clocked, RS Flip Flop, Edge trigger D Flip Flop. Flip Flop Switching time, OK Flip Flop. JK Master Slave Flip Flop, Clock wave forms, Shift registers: Serial in and serial out, Parallel in and parallel out, Counters: Asynchronous counters Synchronous counters, ring counter. [10]
4. **Memories for Digital:** System: Semiconductor Memories, Memory organization and expansion, classification of memories on' the basis of principles of operation, physical characteristics and fabrication technology, ROM and basic memory cells. [10]

Text Books:

1. Moris Mano, "Digital Logic and Computer Design", PHI Publications, 2002
2. R. P. Jain, "Modern Digital Electronics", TMH, 3rd Edition, 2003.

Reference Books:

1. R.L. Tokheim, "Digital Electronics, Principles and Applications", Tata McGraw Hill, 1999.
2. W. Gothman, "Digital electronics", PHI.
3. S. Salivahanan & S. Arivyhgan. "Digital circuits and design", Vikas Publication, 2001

CA 16.105 **Management Accounting** **2-0-0-2**

Total Lectures: 26

1. **Basics of Accounting:** Nature of accounting information, accounting principles – concepts and conventions, accounting equation and financial statements – sole trade, corporate entities (P&L account, balance sheet including adjustments). [6]
2. **Computerized Accounting:** Uses of Microsoft Excel in accounting, analyses of balance sheet with Excel, Tally software - application. [2]
3. **Analysis and Interpretation of Financial Statements:** Ratio analysis as a tool of decision-making; fund flow statement, cash flow statement. [5]
4. **Basic Cost Concepts:** Meaning, nature, classification; inventory valuation, marginal costing and its usage in managerial decision-making. [7]
5. **Long Term Financing and Capital Budgeting:** Sources of long term finance- shares, debentures, capital budgeting – types of projects, non-discounted and discounted cash flow techniques – payback period, internal rate of return and net present value method. [6]

Text Books:

1. Maheshwari S.N., Management Accounting & Financial Control, Sultan Chand & Sons, 14th Ed., 2003
2. Bodhanwala R. J., Understanding and Analyzing Balance Sheets Using Excel Worksheet, Prentice-Hall of India, 2004.

Reference Books:

1. Horngren C. T., Sundem G.L. and Stratton W. O., Management Accounting, Prentice-Hall of India, 12th Ed., 2003.
2. Narayan S. R., Financial Accounting- A Managerial Perspective, Prentice-Hall of India, 2004.
3. Banerjee A., Financial Accounting – A Managerial Emphasis, Excel Publishing House, 2004.

CA 16.135 **C Programming Laboratory** **0-0-4-2**

1. Introduction to C
Testing:
• Data Types & Operators
• Type Conversions

Programs:
• Significant number of programmes in order to cover all contents of unit 1 (at least 6)

2. Operators
Testing:
• Arithmetic, Relational, logical operators
• Bitwise, unary, assignment operators
• Increment and Decrement operators
• Conditional operators
Programs:
• Significant number of programmes in order to cover all contents of unit 2 (at least 10)

3. Control Structure
Testing:
• If-Else statements
• Nested If-Else statements
• Switch
• Loops- For, While, Do-While
• Break, Continue, Go-To Statements, Labels
Programs:
• Minimum 12 programmes to cover all contents of unit 3

4. Array
Testing:
- Processing an array
- Passing arrays to functions
- Multidimensional arrays
- Strings

Programs:
• Minimum 6 programmes to cover all contents of unit 4

5. Function and Pointer
Testing:
- Function prototypes and passing arguments to a function
- Recursion
- Pointers declaration, operations on pointers
- Array of pointers, pointers to arrays

Programs:
• Minimum 6 programmes to cover all contents of unit 5

6. Advance C Concepts

Testing:

- Structure
- Union
- Storage classes in C
- Reading and writing from/to a file

Programs:

• Minimum 6 programmes to cover all contents of unit 6.

CA 16. 107 **Mathematics** **3-1-0-4**

Total Lectures: 40

1. **Matrix and Determinant:** Definition, types of matrices, addition, subtraction, scalar multiplication and multiplication of matrices, adjoint, inverse, rank of matrix, dependence of vectors, Eigen values and vectors of a matrix, Cayley-Hamilton Theorem (without proof), solution of system of simultaneous equations, definition of determinant, minors, cofactors, properties of determinants. [12]
2. **Differentiation:** : Limit at a point, properties of Limit, computation of limits of various types of functions, continuity at a point, derivative, derivatives of sum, differences, product and quotients, chain rule, derivatives of composite functions, logarithmic differentiation, maxima and minima of functions of single variable. [12]
3. **Integration:** Indefinite integrals, methods of integration substitution, by parts, partial fractions, integration of algebraic and transcedental functions, definite integrals and properties. [8]
4. **Ordinary Differential Equations:** Definition, order and degree of equation, solution of ordinary differential equations of first order and first degree, equations in which variables are separable, homogeneous and reducible to homogeneous equations, linear and reducible to liner equations, exact and reducible to exact equations.. [8]

Text Books:

1. Narayan, Shanti “Integral Calculus”, S. Chand & Company, 19993.

2 Dass, H.K., “Advanced Engineering Mathematics”, S. Chand & Company.

Reference Books:

1 Zill, Dennis G. ,Warren Jones, S. ,Wright and Barlett Learning “Advanced Engineering Mathematics”, Student Edition, Canada,2011

2 Ramana B. V., “Higher Engineering Mathematics”, McGraw Hill, New Delhi,2006.

Testing:

- MS Word

Programs:

- Working with Documents.
- Formatting Documents.
- Setting Page style.
- Creating Tables.
- Drawing.
- Tools.
- Printing Documents.

Testing:

- MS Excel

Programs:

- Spread Sheet & its Applications, Opening Spreadsheet, Menus.
- Entering & Deleting Data.
- Setting Formula.
- Formatting Spreadsheets.
- Working with sheets.
- Creating Charts.
- Using Tools.

Testing:

- MS Access

Programs:

- Starting Access, Access Screen, Creating a New Database.
- Creating Tables.
- Working with Forms.
- Creating queries.
- Finding Information in Databases.
- Creating Reports.
- Types of Reports.
- Printing & Print Preview – Importing data from other databases viz. MS Excel etc.

Testing:

- MS Power Point

Programs:

- Creating a presentation.
- Formatting a Presentation.
- Adding Effects to the Presentation.
- Printing Handouts.

CA 16.102 **Operating System** **3-0-0-3**

Total Lectures:40

1. **Introduction:** Definition and types of operating systems, Batch Systems, multi programming, time sharing, distributed and real-time systems, Operating system structure, Operating System Components and Services, System calls, System Programs, Virtual Machines. [4]
2. **Process Management:** Process Concept, Process States, Process Control Block, Operations with examples from UNIX (fork, exec) and/or Windows, Inter-process communication (shared memory and message passing), Scheduling Algorithms, Performance Evaluation. [7]
3. **Threads:** multithreaded model, scheduler activations, examples of threaded programs. Scheduling: multi-programming and time sharing, scheduling algorithms, multiprocessor scheduling, thread scheduling. [5]
4. **Process synchronization and Deadlocks:** critical sections, classical two process and n-process solutions, hardware primitives for synchronization, semaphores, monitors, classical problems in synchronization (producer-consumer, readers-writer, dining philosophers, etc.). Deadlocks-System model, Characterization, Deadlock prevention, Avoidance and Detection, Recovery from deadlock, Combined approach to deadlock handling. [8]
5. **Memory Management:** Logical and Physical Address Space, Swapping, Contiguous Allocation, paging and segmentation, demand paging, virtual memory, page replacement algorithms. [5]
6. **File Management:** Directory systems, File System Implementation issue, access methods, Allocation Methods, Free Space Management. [4]
7. **I/O Management:** Disk Structure, Disk Scheduling, Disk Management, Control of Various Devices, Device Drivers, Interrupt Driven and Poll Driven Data Transfer. [4]
8. **Security and Protection Mechanism:** Computer Security classification, Authentication, System threats, Goals of Protection, Access Matrix. [3]

Text Books:

1. Silbersachatz A.H. and Galvin P.B., “Operating System Concepts”, Pearson Education.
2. Tannenbaum Andrew S., “Operating Systems”, PHI, New Delhi

Reference Books:

1. Stallings William, “Operating Systems: Internals and Design Principles”, Prentice-Hall, New Delhi
2. Dhamdhere D. M. “System Programming and Operating System”, TMH New Delhi
3. Godbole Achyut S, “Operating Systems”, TMH, New Delhi

1. Process and Thread Creation

Testing

- Creation of Process and Thread
- Operations with Process

Programs

- A process to be created with structure or class containing parameters like process- id, arrival time, starting time, end time etc.

2. CPU Scheduling Algorithms

Testing

- Average Waiting Time
- Average Turnaround Time
- Response Time
- Multithreading

Program

- FCFS (with and without arrival time)
- SJF (Preemptive and non-preemptive)
- Round Robin (with and without context switch time)
- Priority scheduling (With and without arrival time)
- Demonstrating time sharing

3. Memory Management Techniques

Testing

- External Fragmentation
- 50% Rule for Fragmentation

Program

- First Fit
- Best Fit
- Worst Fit.

4. Page Replacement Algorithms

Testing

- Belady's Anomaly
- No. of page hits and misses

Program

- FIFO
- LRU
- Optimal Page Replacement Algorithm

5. Deadlock

Testing

- Safety algorithm
- Request algorithm

Program

- Deadlock Avoidance (Banker's Algorithm) for multiple instances of different resource types.
- Deadlock Detection Algorithm for multiple instances of different resource types.

6. I/O

Testing

- Disk Scheduling

Programs

- FCFS algorithm
- Scan algorithm
- C-Scan algorithm

CA 16.106 **System Analysis and Design** **3-0-0-3**

Total Lectures:40

1. **Introduction to system:** Definition, characteristics and elements of system, types of system, System development life cycle, Role of system analyst. [6]

2. **System Planning and Initial Investigation**: Introduction, bases for planning in system analysis, initial investigation, fact finding, information gathering, information gathering tools, fact analysis, determination of feasibility. [6]

3. **Structured Analysis:** Tools of structured analysis: DFD, data dictionary, flow charts, Gantt charts, decision tree, decision table, structured English, pros and cons of each tool. [7]

4. **Feasibility Study**: Objective, types, Steps in feasibility analysis, feasibility report, oral presentation, cost and benefit analysis, classification of costs and benefits. [5]

5. **System Design**: Objective, logical and physical design, design methodologies, structured design, form-driven methodology (IPO charts), structured walkthrough. [6]

6. **Input/ Output and Form Design**: Objectives of input and output design, form design, classifications of forms, requirements of form design. [5]

7. **System Testing and Implementation**: Objectives of testing, test plan, testing techniques/types of system tests, quality assurance goals in system life cycle, System implementation. [5]

Text Books:

1. Awad Elias M, "System Analysis and Design", Galgotia Pub.(P) Ltd.,2nd Edition,2008

Reference Books:

1 Hawayszkiewyez Igor, "Introduction To System Analysis and Design" PHI, New Delhi

2 Mark Lejk and Deeks David , "An Introduction to System Analysis Techniques" PHI, New Delhi.

3 Whitten , Jeffrey L and Lonnie, D Bentey, "System Analysis and Design Methods", TMH. New Delhi

CA 16. 235 **C++ Programming Laboratory** **0-0-4-2**

1. Introduction to C++
Testing:
• Data Types & Operators
• Control Statements
• Arrays
Programs:
• Significant number of programmes in order to cover all contents of unit 1 (at least 6)

2. Classes and Object
Testing:
• Class with function printing hello
• Class with default constructor
• Class with parameterized constructor
• Destructor
• Static and constant data
Programs:
• Apt number of programmes preferably based upon real life examples hotel billing, fee submission etc. (at least 6)

3. Inheritance and Polymorphism
Testing:
• Inheritance
• Function Overloading
• Operator overloading
• Overriding
• Comparisons between private, public and protected
• Virtual function and virtual class
• This pointer
• Exception handling
• Abstract class
Programs:
• Minimum 12 programmes to cover all contents of unit 3

4. I/O handling
Testing:
• Reading and writing from/to a file
• Output formatting
Programs:
• Programmes related with basic file operations (at least 5)

CA 16. 207 **C++ Programming** **3-0-0-3**

Total Lectures:40

1. **Object Oriented Programming:** Basic concepts of object–oriented programming, Structured versus object- oriented programming, merits and demerits of object oriented methodology. [5]
2. **Beginning with C++:** Preprocessor directives, Variables, data types, constants, operators, scope resolution operator, memory management operators, decision and loop control structures, arrays, strings, functions. [7]
3. **Classes and Objects:** Class definition, Structure versus class, accessing member functions within a class, data hiding, arrays within a class, static data and member functions, objects, friend functions and friend classes, constant member functions, pointers to members, constructors and destructor. [8]
4. **Overloading and Exception Handling:** Definition, unary operator overloading, binary operators overloading, overloading of new and delete operators, manipulation of string using operators, type conversion, overloading with friend functions, function overloading, error and exception handling. [8]
5. **Inheritance and Overriding:** Derived and base classes, type of inheritance, derived class constructors and destructor, overriding member functions, public and private inheritance, virtual base classes, abstract classes, this pointer, virtual functions and pure virtual functions, static and dynamic bindings. [8]
6. **Introduction of I/O Streams and the Standard Library:** Header files, I/O stream library, stream I/O for objects, file I/O. [4]

Text Books:

1. Lafore Robert, "Object-Oriented Programming in C++", 4th edition, SAMS.
2. Balagurusamy E., "Object Oriented Programming With C++", 6th edition, Tata McGraw Hill Publishing Co. Ltd., New Delhi.

Reference Books:

1 Stroustrup Bjarne,"Programming -Principles and Practice Using C++", Addison-Wesley.

2 Schildt Herbert, "C++: The Complete Reference", 4th edition, Tata McGraw Hill Publishing Co. Ltd., New Delhi.

CA 16. 201 Computer Architecture 3-1-0-4

Total Lectures:40

1. **Design of Simple Computer**: Micro Operation, Macro Operation, Bus and Memory Transfers, Arithmetic and Logic Micro Operations, Shift Micro Operation, Instruction and Instruction Types. [8]
2. **Instruction Cycle**: Timing and Control Instruction Cycle, Memory Reference Instructions, Input Output and Interrupts, Machine Language Instructions. [5]
3. **Computer Arithmetic**: Hardware algorithm and implementation for Addition, Subtraction, multiplication and division operations, floating point arithmetic operations. [6]
4. **Central Processing Unit**: General Register Organization, Stack Organization, Addressing Modes, Risc vs Cisc Pipeline and Vector Processing, Parallel Processing, Pipelining, Arithmetic Pipeline, Instruction Pipeline, Risc Pipeline, Pipeline Difficulties. [8]
5. **Input Output Organization**: Peripheral Devices, Input-Output Interface, Asynchronous Data Transfer, Modes of Transfer, Programmed I/O, Interrupt I/O Direct Memory Access. [5]
6. **Memory Organization**: Memory Hierarchy, Main Memory, Auxiliary Memory, Associative, Cache Memory, Virtual Memory and Memory Management Hardware. [8]

Text Books:

1. Mano Morris, M., "Computer System Architecture", 3rd edition, Pearson.
2. Stallings William , "Computer Organization and Architecture", 9th Edition, Pearson

Reference Books:

1. Hwang Kai and Jotwani ,Naresh, "Advanced Computer Architecture", 2nd Edition, Tata McGraw Hill.
2. Blanchet ,Gérard, Dupouy, Bertrand, "Computer Architecture", 1st Edition, Wiley Publication.

CA 16. 206 **Computer Graphics** **3-1-0-4**

Total Lectures:40

1 **Basic Concepts:** Application Areas of Computer Graphics, Graphical User Interface, RGB Color model, CMY color models, Advantages of Computer Graphics. [8]

2 **Graphics Hardware:** Random Scan Displays, Raster Scan Display (with Introduction to Flickering, Interlacing, American Standard Video), Color CRT Monitors, Flat Panel Display (Plasma Panel, Liquid Crystal Display, Electroluminescent Display). [7]

3 **Raster Graphics Algorithms:** Line Drawing Algorithms-DDA, Bresenham's Algorithm, Circle and Ellipse Drawing Algorithms, Filling (Scan-Converting Polygon Filling, Inside Outside Tests Boundary Fill and Area Fill Algorithm). Cohen- Sutherland Algorithm of clipping [12]

4 **Transformations:** 2-D Transformations (Rotation, Reflection, Shearing, Scaling), Homogeneous Coordinate Representation, and Translation. [8]

5 **Animation Introduction:** Conventional and Computer-Assisted Animation, Animation languages, methods of controlling Animation, basic rules of Animation. [5]

Text Books:

1. Zhigang X. and Plastock R.A., “Theory and Problems of Computer Graphics (Schaum's Outline)”, Tata Mc Graw Hill, New Delhi.

Reference Books:

1 Hearn Donald D. and Baker M.Pauline, “Computer Graphics” , Prentice Hall India, New Delhi.

2 Krishnamurthy N, “Introduction to Computer Graphics”, Tata Mc Graw Hill Edition, New Delhi.

CA 16. 204 **Computer Networks** **3-1-0-4**

Total Lectures:40

1 **Introduction:** Computer networks; Network topologies, protocols and standards, Network devices: repeaters, bridges, gateway, Routers; categories of networks- LAN, WAN and MAN. [7]

2 **OSI and TCP/IP Model:** Layers and their function, OSI reference model, TCP/IP model, Comparison of models. [5]

3 **Physical layer:** Transmission Media: guided and unguided; Attenuation, Distortion, Noise, Propagation, Switching, ISDN & its service, Multiplexing: Time division & frequency division multiplexing [8]

4 **Data Link Layer:** Functionality, Design Issue, Error Detection & Correction Codes, MAC, Static & Dynamic Channel Allocation, Introduction to IEEE standards. [6]

5 **Network Layer:** Routing Algorithms, Flooding, Broadcast & Multicast routing, congestion Control & internetworking, Quality of services [7]

6. **Application Layer :** Network Security & Privacy, Data Compression & Cryptography, Electronic Mail, The WWW, Multimedia, Audio, Video, DNS, FTP, HTTP, SMTP, telnet etc. [7]

Text Book

1. Tanenbaum A. S., "Computer Networks", Prentice-Hall of India, 4th Ed., 2002.
2. Stallings W., "Data and Computer Communications", Prentice-Hall of India, 5th Ed., 2003.

References Books

1. Forouzan B. A., "Data Communications and Networking", Tata McGraw-Hill, 3rd Ed., 2004.
2. Hayes J. F., "Modeling and Analysis of Computer Communication Networks", Khanna Publishers, 1987.

CA 16.203 **Database Management System** **3-0-0-3**

Total Lectures:40

1. **Introduction**: An Overview of Database Management System, Comparison of Database System and File System, Characteristics of Database Approach, DBMS Architecture, Data Models, Schema and Instances, Data Independence. Data Modeling Using Entity Relationship Model: Entity, Entity Types, Entity Set, Notation for ER Diagram, Attributes and Keys, Concepts of Composite, Derived and Multivalued Attributes, Super Key, Candidate Key, Primary Key, Relationships, Relation Types, Weak Entities, Inheritance, Specialization and Generalization. [10]

2. **Relational Data Model:** Relational Model Terminology: Domains, Attributes, Tuples, Relations, Characteristics of Relations, Relational Constraints: Domain Constraints, Key Constraints, Relational Database Schema, Relational Database Design By ER To Relational Mapping. Introduction to SQL. [11]

3. **Normalization:** Functional Dependencies, Armstrong's Inference Rule, Normal Form up to Boyce Codd Normal Form. [4]

4 **Relational Algebra:** Selection, Projection, Set Theoretic Operations Union, Intersection, Set Difference And Division, Inner, Outer, Left Outer, Right Outer and Full Outer Join. [8]

5. **Transaction Processing And Concurrency Control:** Definition of Transaction, Desirable ACID Properties, Serializable And Non Serializable Transactions, Concurrency, Lost Update, Dirty Read, Concurrency Control Techniques: Locking, 2PL [7]

Text Books:

1. Ramez Elmasri, Shamkant B. Navathe, "Fundamentals of Database Systems", Pearson Education, 7th Edition, 2015.

Reference Book:

1. Jeffrey A. Hoffer, Mary B. Prescott and Fred R. McFadden, "Modern Database Management", Prentice Hall, 8th Edition, 2006.
2. Avi Silberschatz , Henry F. Korth and S. Sudarshan, "Database System Concepts", McGraw-Hill, 6th Edition, 2011.

CA 16.233 Database Management System Laboratory 0-0-4-2

Unit 1: Basic Commands

Testing: Create Table, Insert, Update, Alter, Delete, Where

Queries based on the above elements.

Unit 2: SQL Scalar functions

Testing: UCASE, LCASE, MID, LEN, NOW

Queries based on the above elements.

Unit 3: Aggregate functions

Testing: Max, Min, Sum, Count, Avg , First, Last

Queries based on the above elements.

Unit 4: Clauses

Testing: Distinct, Alias, Order by, Group by, Having

Queries based on the above elements.

Unit 5: Logical Operators

Testing:

OR, AND, Not, Between, Like, All, Any

Queries based on the above elements.

Unit 6: SQL Constraints

Testing: Not NULL, Check, Primary Key, Foreign Key, Cascade delete, Default

Queries based on the above elements.

CA 16. 209 **Discrete Mathematics** **3-1-0-4**

Total Lectures:40

1. **Progressions:** Arithmetic Progression, Arithmetic mean, Harmonic Progression Harmonic mean, Geometric Progression, Geometric mean. [6]

2. **Set Theory:** Definition of Sets, Subsets, Cardinality of Sets, types of sets: Equal Sets, Universal Sets, Finite and Infinite Sets, proper set, power sets, Operations on Sets: Union, Intersection, Complement of Sets, set difference, Cartesian Product, Venn Diagrams, and Algebra of sets, duality, counting principle. [10]

3. **Relations and Functions:** Definition, types of relation, Ordered Pairs, properties of relation, equivalence relations, partial ordering relation. Function: Domain and Range, Onto, Into, and One to One Function, Composite and Inverse Functions. [8]

4. **Prepositional Calculus:** Propositions, Logical Connectives: conjunction, disjunction and negation, Truth Tables, Tautologies and Contradictions, Conditional and Bi-conditional statements. [8]

5. **Group Theory:** Definition of a group, properties of group, different types of group, subgroup, finite, infinitely, countable and Cyclic Groups. [8]

Text Books:

1. Lipschutz, Seymour and Lipson, Mar c “Discrete mathematics”, Tata Mc Graw-Hill Publications, Second Edition.

Reference Books:

1 Rremblay, J.P. and Manohar, R., “Discrete Mathematical Structures with Applications to Computer Science”, The McGraw Hill Companies.
2 Ross, Kolman Busby, “Discrete Matheamatical Structures”, Prentice Hall International.
3 Vasishtha, A. R., “Abstract Algebra” , KRISHNA Prakashan Media (P) Ltd.

CA 16. 208 **Electronic Commerce** **3-0-0-3**

Total Lectures:40

1. **Electronic Commerce**: Overview and Scope, Traditional Commerce vs. Electronic Commerce, Impact of E-Commerce, Electronic Markets, Internet Commerce, e-commerce in perspective, Application of E Commerce in Direct Marketing and Selling, advantages and disadvantages, and future of E-commerce. [9]

2. **Business strategy in an Electronic Age:** Value Chains, Supply chain, Porter's value chain Model, Inter Organizational value chains, Strategic Business unit chains and industry value chains. [7]

3. **Business to Business E-Commerce**: Inter-organizational Transitions, Credit Transaction Trade Cycle, a variety of transactions. Electronic Data Interchange (EDI): Introduction, Benefits of EDI, EDI Technology, EDI standards, EDI Communication, EDI Implementation, EDI agreement, EDI security. [9]

4. **Electronic Payment System:** Introduction, Online Payment System, Prepaid Electronic Payment System, Post Paid Electronic System, E-Cheques, Credit Cards, Smart Cards, E-Purses, Debit Cards, Legal Risk of E-Payment System. [8]

5. **Securing Network Transaction:** Security Policy, Procedures and Practices, Transaction Security, Cryptography Algorithm, Public Key Algorithm, Authentication Protocol, Digital Signature, E-Mail Security. [7]

Text Books:

1. Whitely David, "E-commerce Strategy, Technology and application", Tata McGraw Hill Publications, New Delhi.

Reference Books:

1 Kalakota ,R. and Whinston, A. B. "Readings in Electronic Commerce", Addison Wesley.
2 Schneider, Gary P. and Perry ,Jame, "Electronic Commerce" Thomson Publication.
3 P.T. Joseph, S.J., "E-Commerce An Indian Perspective", PHI.

CA 16. 234 **Internet Laboratory** **0-0-4-2**

UNIT I: Evaluate e-mail software and Web-based e-mail services

Testing: Mail configuration on different mail sites

Programs:

- Main features of e-mail and how it works
- Describe the Thunderbird and Opera e-mail clients
- Describe and use Web-based e-mail services
- Configure and use Outlook Express to send, receive, and print e-mail messages
- Create and maintain an address book in Outlook Express
- Configure and use Hotmail to send, receive, and print e-mail messages
- Create and maintain an address book in Hotmail

UNIT II: Use search engines and directories effectively

Testing: Web search tools **(**google, Google Scholar, DuckDuckGo**,** Metasearch engines**)**

Programs:

- Determine whether a research question is specific or exploratory
- How to formulate an effective Web search strategy to answer research questions
- Uses of Web search engines, Web directories, and Web meta search engines effectively
- Use Boolean logic and filtering techniques to improve your Web searches
- Use advanced search options in Web search engines
- Assess the validity and quality of Web research resources
- Describe the future of Web search tools

UNIT III: Use FTP and other services to transfer and store data

Testing: File Transfer Protocol

Programs:

- Describe what FTP is and how it works
- Demonstrate how to use an FTP client program and Web browser to transfer files
- Demonstrate navigation of an FTP site using a Web browser
- Demonstrate how to compress and decompress files and how to check them for viruses
- Download an FTP client program using a Web browser
- Install and use a compression program
- Trace the connection between your computer and a remote computer

UNIT IV: Important features of electronic commerce

Testing: E-Business

Programs:

- Important sites that conduct electronic commerce
- Basics of electronic commerce
- How companies generate revenues online
- Companies reduce costs and improve operational efficiency using Internet technologies
- New ways of doing business on the Web such as online auctions etc.
- International, legal, and ethical concerns for electronic commerce

CA 16. 210 **Java Programming** **3-1-0-4**

Total Lecture:40

1. **Basic Concepts:** Importance of Java, Java Byte code, Java and HTML, the Java buzzwords, using blocks of code, lexical issues, Java Class Libraries. [4]
2. **Java Programming:** Constants, Variables, Data Types, Operators, Type Conversion in Expression, Mathematical Functions, Decision Control Structure, Loop Control Structure, Arrays. [8]
3. **Classes:** Class fundamentals, declaring objects, assigning object reference variables, introducing methods, constructors, the this keyword, garbage collection, the finalize () method, overloading methods, using objects as parameters, returning objects, recursion, introducing access control, understanding static, introducing final, arrays revisited, introducing nested and inner classes, exploring the string class, using command-line arguments, Vector, Wrapper Classes. [5]
4. **I/O and String Handling:** I/O basics, reading console input, writing console output, the PrintWriter class, reading and writing files, string constructors, string length, special string operations, character extraction, string comparison, searching strings, modifying a string, data conversion using valueOf (), changing the case of characters within a string, StringBuffer. [6]
5. **Inheritance:** Inheritance basics, using super, create a multilevel hierarchy, constructors, method overriding, dynamic method dispatch, abstract classes, final with inheritance, object class. [5]
6. **Package, Interfaces and Exception Handling:** Packages, access protection, importing packages, interfaces, exception-handling fundamentals, exception types, uncaught exceptions, using try and catch, multiple catch clauses, nested try statements, throw, throws, finally, Java's built-in exceptions, creating your own exception subclasses, using exceptions. [7]
7. **Applet Programming:** Applet life cycle, Creating executable application, Designing a web page, Applet Tag, Parameter passing in applets, Graphic Class, lines, rectangles, circle and ellipse, polygons. [5]

Text Books

1. Herbertz Shildt ,"Java The Complete Reference,", 7th ed.,TMH, New Delhi
2. Balagurusamy E, "Programming With Java " , TMH, New Delhi

Reference Books

1. Borror A. B., "Object-Oriented Programming with Java-an ultimate Tutorial", Dreamtech Press, 2000.
2. Budd T., "Understanding Object-Oriented Programming with Java", Pearson Education Asia, 2001.
3. Arnold K., Gosling J. and Holmes D., "The Java Programming Language", Addision-Wesley, 3rd ed., 2000.

CA 16.236 Java Programming Laboratory 0-0-4-2

1. Introduction

Testing

- Data Types & Operators
- Control Statements
- Arrays

Programs

- Apply logic to print different patterns(at least 3)
- Programs like to print Fibonacci series, check whether a number is prime or not
- Max and min of a given list of numbers, their sum and average
- Result of a student using switch-case
- Implementing matrix operations
- Searching and Sorting

2. Classes, Object & Inheritance

Testing

- Objects and reference variables
- Constructors and parameterized constructors
- this, static, command line arguments
- Inheritance, overloading and overriding
- super, abstract classes and Dynamic method dispatch

Programs

- Write a program to illustrate super .
- Show method overloading to calculate the area of different shapes.
- Manipulate the above program to illustrate run time polymorphism.

3. I/O and String Handling

Testing

- Reading console input and writing console output
- BufferedReader class and PrintWriter class
- String operations and comparisons

Program

- Write a program to print the last characters of all the strings given from command line
- Change the case of characters within a string.
- Write an applet to print "HELLO"**.**

4. Package, Interfaces and Exception Handling

Testing

- importing packages
- interfaces and multiple inheritance
- exception-handling fundamentals
- built-in exceptions and creating one's own exception subclasses

Programs

- Write and execute a program which is inside a package "MyPacK".
- Write a program which imports a package.
- Write a program in which implements the concept of multiple inheritance.
- Write a program that handles two Exceptions, each at different run.

- Write a program in which an user defined exception is created.

5. Applet

Testing

- Applet Life Cycle
- Applet tag

Programs

- Write an applet to print “HELLO”**.**
- Write an applet to print different shapes.
- Write an applet to which works according to values passed through html page.

CA 16. 205 **Management Information System** **3-0-0-3**

Total Lectures:40

1. **Introduction:** Elements, characteristics, objectives and importance, relationship between MIS and Computer, role of MIS in the functions of management. [7]

2. **Information Concept:** Classification of information, levels of information, techniques of data collection, quality aspect of information, value of Information. [7]

3. **Decision Making:** Decision making concepts, rationality in decision making, decision support system, MIS as a technique for programmed decisions, structured Vs Un-structured decisions, formal vs. informal systems, model of decision making, methods, MIS and role of decision making. [8]

4. **Manager and Computers:** Database concept, database models, database design, RDBMS, MIS and RDBMS, network topology, LAN, MAN, WAN and data communication. [6]

5. **Development of MIS:** Strategic and project planning for MIS, conceptual system design, detailed design, implementation, evaluation and maintenance of the MIS, pitfalls of MIS. [6]

6. **Applications of MIS:** MIS for marketing, financial, production management, human resource management. [6]

Text Books:

1. Jawadekar,W. S. "Management Information System", Tata McGraw- Hill Publishing Co. Ltd., New Delhi

Reference Books:

1 Murdick, R, G, Ross J E and Clagget, J,R, "Information Systems for Modern Management", PHI, New Delhi

2 Sadagopan, "Management Information System", PHI, New Delhi.

3 Parker, Case Thomas, "Management Information System: Strategies and Action", Tata McGraw- Hill Publishing Co. Ltd., New Delhi

CA 16. 364 **Artificial Intelligence** **3-0-0-3**

Total Lectures: 40

1. **Overview of A.I.:** Introduction to AI, Importance of AI, AI and its related field, AI techniques.

[4]

2. **Problem space and search**: Defining the problem as a state space search, Production system and its characteristics, Issues in the design of the search problem.

[5]

3. **Heuristic search techniques** : Generate and test, hill climbing, best first search technique, problem reduction, constraint satisfaction

[6]

4. **Game Playing** : Minimax , alpha-beta pruning.

[4]

5. **Predicate logic**: Definition, representation of simple facts in logic, well formed formula, resolution.

[8]

6. **Knowledge representation**: Definition and importance of knowledge, Knowledge representation, Various approaches used in knowledge representation, Issues in knowledge representation.

[8]

7. **Learning:** Introduction learning, Types of learning, Introduction to neural networks.

[5]

Text Book:

1. Rich Elaine and Knight Kevin , Artificial Intelligence, Tata McGraw – Hill, 3rd edition, 2012

Reference Books:

1. Russell Stuart and Norvig Peter, Artificial Intelligence: A Modern Approach, Prentice Hall; 3 edition,2009

2. Patterson D.W., "Introduction to AI and Expert Systems", PHI, 1999

CA 16. 375 **Bioinformatics** **3-0-0-3**

Total Lectures:40

1. **Introduction to Networking:** Definition and scope of networking, Basic network topology, Concept of LAN, MAN and WAN, Introduction to Internet and data transfer protocol (TCPI/P, FTP) [5]

2. **Biological Information Resources:** Introduction to biological data and database management, Biological databases – Protein databanks (Primary and Secondary databank; Sequence and structure databank), Genomic databanks (Sequence and specialized databanks). [5]

3. **Sequence Alignment:** Introduction to biological sequence alignment, Database searching, Algorithm for sequence alignment, Pairwise alignment (Needleman and Wunsch algorithm, Smith-Waterman algorithm), Multiple Sequence Alignment, Concept of Gaps, Gap penalties and scoring matrices. [7]

4. **Tools for Sequence Alignment:** FASTA, BLAST, Variations of BLAST, Alignment scores and statistical significance of database searches. [8]

5. **Genomics:** Genome, Gene structure of prokayotes and eukaryotes, Concept of ORFs, GC-content, Codon Usage, cDNAs and ESTs, Serial analysis of gene expression (Microarrays). [9]

6. **Proteomics:** Introduction to proteome and proteome analysis (2D electrophoresis, Mass spectrophotometry, Protein microarray and X-ray crystallography), Algorithm for modeling protein folding. [6]

7. **Phylogenetics:** Introduction to phylogenetics, Parsimony, Molecular phylogenetics, Methods of phylogenetic tree construction

Text Books:

1. Peruski and Peruski: The Internet and the new Biology: tools for Genomic and Molecular Research, ASM Publishing House, India.

Reference Books:

2 Higgins and Taylor, Bioinformatics, Oxford University Press, US.

CA 16. 379 **Cloud Computing** **3-0-0-3**

Total Lectures:40

1. **Introduction:** System models for advanced computing –clusters of cooperative computing, grid computing and cloud computing; software systems for advanced computing-service oriented software and parallel and distributed programming models with introductory details, Features of cloud platform. [8]
2. **Services and Model:** Cloud Computing services models and features in Saas, Paas and Iaas. Service oriented architecture and web services; Features of cloud computing architectures and simple case studies. [7]
3. **Virtualization:** Characteristic features, Taxonomy Hypervisor, Virtualization and Cloud Computing, Pros and Cons of Cloud Computing, Technology Examples/Case Studies. [6]
4. **Cloud programming:** Map Reduce Hadoop Library from Apache, Open Source Cloud Software Systems Eucalyptus. [8]
5. **Architecture:** Cloud Architecture and Service modeling, Cloud resource management, Cloud Application trends. [5]
6. **Cloud and SOA :** SOA journey to infrastructure, SOA and cloud, SOA defined, SOA defined, SOA and IAAS, SOA based cloud infrastructure steps, SOA business and IT services. [6]

Text Books:

1. Kaittwang Geoffrey C.Fox and Jack J Dongrra "Distributed and Cloud Computing", , Elsevier India 2012.

2. Buyya Raj Kumar, Vecchiola Christian and Selvi S.Tanurai ,"Mastering Cloud Computing", TMH, 2012.

Reference Books:

1. Ritting John W. House and Ramsome James F "Cloud Computing", , CRC Press, 2012.

2. Shroff Gautam "Enterprise Cloud Computing", , Cambridge University Press, 2012.

CA 16. 368 **Cyber Law** **3-0-0-3**

Total Lectures:40

1. **Fundamentals of Cyber Law**: Jurisprudence of Cyber Law- Overview of Computer and Web Technology- Introduction to Indian Cyber Law- Overview of General Laws and Procedures in India; Freedom of Expression on the Internet. [10]

2. **E-commerce-Legal Issues:** Electronic Commerce –Digital Signature- Meaning; Creation of Digital Signature; Understanding how digital signatures work, Role in Information Technology; technical issues; legal issues; Crimes relating to digital signature certificates. [10]

3. **Cyber Crimes:** Meaning of Cyber Crimes –Cyber crimes under IPC, Cr.P.C and Indian Evidence Law - Cyber crimes under the Information Technology Act,2000 - Cyber crimes under International Law - Hacking Child Pornography, Cyber Stalking, Denial of service Attack, Virus Dissemination, Software Piracy, Internet Relay Chat (IRC) Crime, Credit Card Fraud, Net Extortion, Phishing etc - Cyber Terrorism - Violation of Privacy on Internet - Data Protection and Privacy ;Concept of Social Networking – Legal Implications of Social Networking [12]

4. **Intellectual Property Issues and Cyberspace : The Indian Perspective;** Overview of Intellectual Property related Legislation-Copyright law & Cyberspace; Trademark law & Cyberspace; Law relating to Semiconductor Layout & Design. [8]

Text Books:

1. Rodney D. Ryder, Guide to Cyber Laws, 2nd Edit, Wadhwa and Company, Nagpur
2. Sharma,Vakul. Information Technology law and Practice. Universal law Publishing,2011
3. Rattan, Jyoti. Cyber law. New Delhi: Bharat law House,2011.

Reference Books:

1 Seth,Kanika. Cyber Law in the Information Technology Act. Nagpur : Lexis Nexis Butterworth Wadhwa,2009
2. Rodney D.Ryder,Guide of Cyber Law,2nd Edition.
3. Faruq Ahmed,Cyber law in India.

CA 16. 369 **E-Business** **3-0-0-3**

Total Lectures:40

1. **Internet as a Business Driver:** Internet, WWW, Benefits of Internet and WWW, Difference between e-Commerce and e-Business, Mobile Internet, Internet Consumers. [8]
2. **Introduction to e-Business Trends:** Trends Driving e-Business, Customer Oriented Trends, e-Service Trends, Organizational Trends, Enterprise Technology Trends and General Technology Trends. [7]
3. **E-Business Models:** Disruptive Technology, e-Business Models, Internet Pricing, e-Cash, Online Retailing, Constructing e-Business ICT Framework. [10]
4. **Leveraging the Web for Marketing:** Business Enhancement, Framework for Web Marketing, Web Usability, Content Management, and Impact of Internet on Marketing. [9]
5. **Online Resources and Deployment:** Meta Search Engines, Boolean Searching on Internet, Best Practice Web Searching, The Invisible Web, [6]

Text Books:

1.Ravi Kalakota, Marcia Robinsion, "E-Business 2.0: Roadmap For Success", 2nd Edition, Pearson.
2.Paul Phillips, "E-Business Strategy", 1st edition, TMH.

Reference Books:

1.Colin Combe, "Introduction to e-Business", 1st Edition, Routledge
2.Azhar Kozami**, "**Business Policy and Strategic Management", 2nd Edition, Tata McGraw Hill.

CA 16. 377 **Geographical Information System** **3-0-0-3**

Total Lectures:40

1. **Genesis and Progression:** Basic Concepts, Benefits of Computerization of Information, Users of GIS, Introduction to Real World and Data Model, Geometric Representation of objects, Levels of Measurement, Applications of GIS. [8]
2. **Vector Data Models:** Introduction, Spaghetti Model, Topology Model, Data Compression, Storing Vector Data. [7]
3. **Raster Data Models:** Necessity and Characteristics, Coding and Storage of Raster Data, Compression of Raster Data, Run Length Encoding, Chain Codes, Block Codes, Quad Tree Model, Conversion and Contrast between Vector and Raster Models. [10]
4. **Hardware and Software Requirements for GIS:** Basic Hardware Devices viz Computer, VDU, Quantizers, Printers, Plotters, etc. DBMS, Structure of Databases, Multimedia, WWW. [9]
5. **Basics of Data Collection:** Digitizing Maps, Scanning, Manual Digitizing, Arial Photographs, Photo Interpretation, Remote Sensing, Correction, Surveying. [6]

Text Books:

1. Bernhardsen Tor, "Geographic Information System: An Introduction", 3rd edition, Wiley Publication.
2. Longley Paul, "Geographic Information Systems and Science", 2nd Edition, Wiley Publication.

Reference Books:

1 Bjarne Stroustrup ,"Programming -Principles and Practice Using C++", Addison-Wesley.

2 Herbert Schildt , "C++: The Complete Reference", 4th edition, TMH.

CA 16. 366 **Information Security** **3-0-0-3**

Total Lectures: 40

1.Introduction: Information, Characteristics of Information, Security Attacks, NSTISSC security model, Concepts of Policies; procedures; Guidelines and Standards. [8]

2.Cryptography: Conventional Encryption Principles, Conventional encryption algorithms, cipher block modes of operation, location of encryption devices, Public key cryptography principles, public key cryptography algorithms, digital signatures, digital Certificates. [10]

3.IP Security: IP Security Overview, Architecture, Authentication Header, Encapsulation Security Payload, Combining Security Association, Key Management, Pretty Good Privacy, S/Mime and Types. [7]

4.Web Security and E-Commerce: Web Security Requirement, SSL and Transport Layer Security, Secure Electronic Transactions, Introduction to E-Commerce, Transactions on E-Commerce, Requirement of Security on E-Commerce. [7]

5. System Security: Recognized Security Threats, Virus, Trojan horse, Worm, Spyware, Adware, Key Logger, Denial of Services, Firewall Design Principles, Trusted Systems, Common criteria for information technology security and evaluation. [8]

Text Book:

1. William Stallings ,"Cryptography and Network Principles and Practice", Fourth Edition, , Pearson.

2. William Stallings, "Network Security Essentials (Applications and Standards)" Pearson.

Reference Books:

1. Forouzan, Mukhopadhyay ,"Cryptography & Network Security", , McGrawHill
2. Godbole "Information Systems Security", , Wiley-India
3. Shah Deven "Information Security Principles and Practice", , Wiley-India

CA 16.365 **Internet Technologies** **3-0-0-3**

Total Lectures:40

1.	**Introduction:** Layering, TCP/IP Layering, Internet Addresses, The Domain Name System, Client Server Model, Port Numbers, Implementations and Application, Programming interfaces.	05
2.	The Link Layer Ethernet and IEEE 802 Encapsulation Trailer Encapsulation, **SLIP:** Serial Line IP, Compressed SLIP, **PPP**: Point-to-Point Protocol.	04
3.	**IP**: The Internet Protocol IP Header, IP Routing, Subnet Addressing, Subnet Mask, Special Case IP Addresses.	06
4.	**Introduction to ARP**: Address Resolution Protocol and RARP: Reverse Address Resolution Protocol, ARP Packet Format, Proxy ARP, RARP Packet Format.	07
5.	**ICMP**: Internet Control Message Protocol Introduction, ICMP, Message Types, ICMP Address, Mask Request and Reply , IP Routing Routing Principles, Introduction to Dynamic Routing; . **UDP**: User Datagram Protocol UDP Header, UDP Checksum; **DNS**: The Domain Name System DNS Basics, DNS Message Format, security.	10
6.	**TCP**: Transmission Control Protocol TCP Services, TCP Header TCP Connection, Establishment and Termination, TCP Timeout and Retransmission, Repacketization; Telnet and Rlogin Remote Login Rlogin Protocol, SMTP Protocol; **FTP**: File Transfer Protocol and SMTP: Simple Mail Transfer Protocol.	08

Text Books:

1. Tannenbaum A. S., “Computer Networks”, Prentice-Hall India., New Delhi
2. Forouzan Behrouz A, “Data Communication and Networking”, TMH, New Delhi

Reference Books:

1 Sybex ,“Networking Complete”, BPB Publication, New Delhi

2. Stallings Willam, “Data and Computer Communication”, Pearson Education, New Delhi

CA 16. 362 **Knowledge Management** **3-0-0-3**

Total Lectures:40

1. **Introduction:** Definition, Evolution, Types, Implication for Knowledge Management [6]

2. **Life Cycle:** Challenges, Difference, Knowledge management system Life Cycle, Comparative Studies Between SDLC and Knowledge Management System Development, Role of Knowledge Developer. [8]

3. **Knowledge Creation and Architecture:** Knowledge Codification, Need of Codification, and Knowledge Tools for Codification, Developer Skills Set. [9]

4. **Knowledge Transfer and Internet:** Internet and Knowledge, E-Business, Ethical and Legal Issues in Knowledge Management. [8]

5. **Executive Information and support Systems**: Business Expert System and AI, OLTO & OLAP; Data Warehousing; Data Marts, Data Warehouse architecture; Tools for data warehousing. [9]

Text Books:

1. Awad, Elias M., "Knowledge Management", TMH, New Delhi

Reference Books:

1 Inmon, W. H., "Building Data Warehousing", Wiley, New Delhi

2 Han, Jiawei, Kamber, Michelinal, "Data Mining Concepts & Techniques", Harcourt India, New Delhi

Testing:

- Flash editor and toolbox.
- Frames and key frame concepts
- Color schemes

Application programs based on above elements in different areas of computing like- Science, Business, Mathematics and other manual processes.

Testing:

- Animation using shape tween and motion tween.

Application programs based on above elements in different areas of computing like- Science, Business, Mathematics and other manual processes.

Testing:

- concept of layers
- Understanding guide ,mask layer.

Application programs based on above elements in different areas of computing like- Science, Business, Mathematics and other manual processes.

Testing:

- Animation using symbols (movie clip, graphic and buttons) and library.

Application programs based on above elements in different areas of computing like- Science, Business, Mathematics and other manual processes.

Testing:

- Animation of text morphing.

Application programs based on above elements in different areas of computing like- Science, Business, Mathematics and other manual processes.

CA 16. 304 **Multimedia Technolgy** **3-0-0-3**

Total Lectures: 40

1. **Overview** - Multimedia - Definitions, Basic properties, Temporal and non temporal medium, Multimedia applications, Uses of Multimedia, Stages of multimedia project, requirements to make good multimedia, Multimedia skills and training.

[6]

2. **Multimedia-Hardware and Software**: Production Platforms, Hardware Peripherals, Connections, Memory and Storage devices, Media software tools, Multimedia Authoring tools, Production Standards.

[8]

3. **Multimedia building blocks**: Audio, basic sound concepts, music, speech, MIDI versus digital audio, audio file formats, sound for the web, images and graphics-basic concepts, Digital video production and editing techniques, animation-basic fundamentals, Kinematics, morphing , animation s/w tools and techniques, animation for the web.

[10]

4. **Data Compression:** Need of Compression techniques, Difference of lossless/lossy compression techniques. Storage space and coding requirements, classification of coding, compression techniques-JPEG and MPEG.

[9]

5. **Multimedia and Internet:** HTML and web authoring, Multimedia considerations for Internet, Design considerations for web pages ,Web Browsers, Web page makers and editors, Media Communication, Media Consumption, Media games.

[7]

Text Book:

1. Steinmetz R., and Nahrstedt K., Multimedia - Computing, Communications and Applications, Pearson Education Asia, 2nd Ed., 2003.

References Books:

1. Buford J. F. K., Multimedia System, Addison-Wesley, 3rd Ed., 1994.
2. Vaughan T., Multimedia - Making it Work, Tata McGraw-Hill, 3rd Ed., 2002.

CA 16.367 **Network Security** **3-0-0-3**

Total Lectures:40

1 **Introduction:** Attacks, Services and Mechanisms, Security Attacks, Security Services, Integrity check, digital Signature, authentication, has algorithms. [3]

2 **Secret Key Cryptography:** Block Encryption, DES rounds, S-Boxes IDEA: Overview, comparison with DES, Key expansion, IDEA rounds, Uses of Secret key Cryptography; ECB, CBC, OFB, CFB, Multiple encryptions DES. [8]

3 **Hash Functions and Message Digests:** Length of hash, uses, algorithms (MD2, MD4, MD5, SHS) MD2: Algorithm (Padding, checksum, passes.) MD4 and 5: algorithm (padding, stages, digest computation.) SHS: Overview, padding, stages. [7]

4 **Public key Cryptography:** Algorithms, examples, Modular arithmetic (addition, multiplication, inverse, and exponentiation) RSA: generating keys, encryption and decryption. Other Algorithms: PKCS, Diffie-Hellman, El-Gamal signatures, DSS, Zero-knowledge signatures [7]

5 **Authentication:** Password Based, Address Based, Cryptographic Authentication. Passwords in distributed systems, on-line vs offline guessing, storing. Cryptographic Authentication: passwords as keys, protocols, KDC's Certification Revocation, Interdomain, groups, delegation. Authentication of People: Verification techniques, passwords, length of passwords, password distribution, smart cards, biometrics. [6]

6 **Example System:** Kerberos: purpose, authentication, serer and ticket granting server, keys and tickets, use of AS and TGS, replicated servers. Kerberos V4: names, inter-realm authentication, Key version numbers. Kerberos V5: names, realms, delegation, forwarding and proxies, ticket lifetimes, revoking tickets, multiple Realms. [4]

7. **Network Security:** Electronic mail security, IP security, Network management security. Security for electronic commerce: SSL, SET. System Security: Intruders and Viruses, Firewalls, Intrusion Detection. [4]

Text Books:

1. Atul Kahate," Cryptography and Network Security", TMH, New Delhi

2. Kaufman, C., Perlman, R., and Speciner, M., "Network Security, Private Communication in a public world" , PHI.

Reference Books:

1 Stallings, W., "Cryptography and Network Security: Principles and Practice", Prentice Hall.

2. Stallings, W., "Network security Essentials: Applications and standards", Prentice Hall.

3. Behrouz A Forouzan, "Cryptography and Network Security"; McGraw Hill;.

CA 16. 373 **Software and CASE Tools** **3-0-0-3**

Total Lectures:40

1. **Software Engineering Fundamentals :** Definition of software product and process, Software Characteristics, Components, Applications, Layered Technologies, Processes and Product, Methods and Tools, Generic View of Software Engineering, Software Crisis and Software development paradigms, [5]
2. **Software Requirements Analysis & Specification:** System specification, Software requirements specification (SRS) standards, Analysis Modeling: Difference between Data and Information, ER Diagram, Dataflow Model, Control Flow Model, Control and Process Specification, Data Dictionary [8]
3. **Software Design:** Software architecture, Modular design - cohesion and coupling, Process-oriented design, Data-oriented design, User-interface design, Real-time software design, introduction to Object Oriented Design. [7]
4. **CASE Tools, Coding and Testing** Computer-aided software engineering, Introduction to CASE, Building Blocks of CASE, Integrated Case Environment, Characteristics of good Programming languages, Introduction to Testing Process, Testing Activities like Unit, Integration & System Testing. [7]
5. **Software Reengineering:** Business Process Reengineering, Reverse Engineering, Software re-engineerin.. [5]
6. **Software Quality and Metrics:** SQA-Software Quality Assurance, Software Reliability, Software quality metrics, SQA plan, ISO 9000 and 9001 Quality Standards. [8]

Text Books:

1. Pressman R.S. , "Software Engineering", TMH.
2. Rumbaugh James ,Object Oriented Modeling and Design, Prentice Hall- Gale
3. The Unified Modeling Language User Guide - Grady Booch, James Rumbaugh, Ivar Jacobson.

Reference Books:

1 Pankaj Jalote,"An Integrated Approach to Software Engineering", NAROSA.
2 Designing Flexible Object Oriented systems with UML - Charles Ritcher
3 Fairely, R.E., "Software Engineering Concepts", McGraw-Hill
4 Object-Oriented Analysis and Design: using UML Mike O'Docherty Wiley Publication

CA 16. 303 **Software Engineering** **3-0-0-3**

Total Lectures:40

1. **Introduction:** Software Characteristics, Components and Applications, Software Engineering a layered Technology, Software life cycle models, Waterfall, Prototype, Evolutionary and Spiral Models. [8]

2. **Software Project Management:** Basic Concepts, Project Management: Core functions, support functions, Project Integration Management. [8]

3. **Software Project Planning:** Objectives, decomposition techniques: software sizing, problem based estimation, lines of code based estimation, and function point based estimation, process based estimation, Cost Estimation Models:- COCOMO, Risk Management. [8]

4. **Software Design:** Design Principles, Design Concepts:- abstraction, refinement, modularity, software architecture, structured partitioning, information hiding**,** effective Modular Design:- functional independence, cohesion and coupling, Object Oriented analysis and Design. [8]

5. **Software Testing:** Testing Fundamentals, Design of Test Cases, White box testing, Basis Path testing, Control structure Testing, Black box testing. [8]

Text Books:

1. Pressman R.S., "Software Engineering", Tata McGraw Hill Publishing Company Ltd., New Delhi.

Reference Books:

1 Jalote Pankaj,"An Integrated Approach to Software Engineering", NAROSA.
2 Sommerville, Ian "Software Engineering", Pearson Education
3 Fairely, R.E., "Software Engineering Concepts", McGraw-Hill

CA 16. 363 **System Software** **3-0-0-3**

Total Lectures:40

1. **Overview:** Language processors, data structures for language processors, assemblers, macros and macro processors, compilers, interpreters, linkers and loaders. [5]

2. **Operating System:** Functions of Operating System, Kernel, Shell, Process, Process state diagram, System Calls. [5]

3. **Assemblers:** Design of an assembler ,one pass and two pass Assembler, Databases of Assemblers, table processing [7]

4. **Macro Processors:** Importance of Macro, Macro Definition, Macro call, Macro Expansion, Conditional Macro expansion, Nesting of Macros, Functions of Macro Processor . [8]

5. **Loaders and Linkers:** Function of Loaders, loader schemes - compile and go, general, absolute, subroutine linkages, relocating loaders, direct linking loaders, binders, linking loaders, overlays, dynamic binders. [9]

6. **Compilers :** Types of Compilers, Phases of compiler design, recursion, call and return statements. [6]

Text Books:

1. Donovan J.J., "Systems Programming", New York, Mc-Graw Hill, 1972.

Reference Books:

1 Leland L Beck,"System Software, An Introduction to System Programming", Pearson Education, 13th Indian Reprint, New Delhi, 2003.

2 Dhamdhere, D.M., "Introduction to Systems Software", Tata Mc-Graw Hill 1996.

Testing:

- Markup Tags
- Formatting Tags
- Frames
- Form Elements

Programs:

- Design web pages based on above Tags.
- Design and formatting a form based on form elements

Testing:

- Cascading Style sheets
- Dragging
- Dropping
- Div tag.

Programs:

- Based on above CSS formatting on HTML scripts.

Testing:

- java Script Declaration and Expressions
- Control Structure and Functions
- Java Script: Properties and Methods
- Array Object
- Date Object
- Math Object
- String Object
- Events in java Script: Onblur, Onclick, on change, on focus.

Programs:

- Form validation through JavaScript
- Program for Event handling
- Working with Date and Time Functions
- Program for calculator

Testing:

- VBScripts String
- Date and Time
- Arrays
- control Structure
- Looping
- Methods and events
- data validation

Programs:

- Form validation through VBScript
- Program for Event handling
- Working with Date and Time Functions

Testing:

- XML components
- DTD
- Creating a Valid Document From a DTD

Programs:

- Basic XML Document
- Access XML document elements through programs

CA 16.301 **Web Technology** **3-0-0-3**

Total Lectures:40

1. **Introduction:** Clients, Servers, and Communication, The Internet Basic Internet Protocols, The World Wide Web, HTTP request message, response message, Web Clients Web Servers. [5]

2. **HTML:** HTML Document, Markup Tags (HTML, HEAD, TITLE, BODY, PRE, LIST, HR, BR), Formatting Tags (MARQUEE, BOLD, ITALICS, SUBSCRIPT), Linking, URL, Relative Path Vs Absolute Path names, Images, Tables, Frames, Form Elements (Text, Buttons, List, Reset, Submit, Radio buttons, Checkbox); DHTML: Cascading Style sheets, Dragging, Dropping, Layers, Div tag. [8]

3. **JavaScript:** Declaration and Expressions, Control Structure and Functions, Variable scope Global Vs Local, Object in Java Script: Properties and Methods, Array Object, Date Object, Math Object, String Object, Events in java Script: Onblur, Onclick, on change, on focus, Design of Interactive forms; [9]

4. **VBScript:** Fundamentals, Variables, String, Constant, Date and Time, Arrays, control Structure, Design making, looping, Sub procedure, Object Methods and events, data validation. [7]

5. **XML:** Overview, Comparison of XML and html, components of XML, XML document, XML declaration, Root element, An empty element, attributes, Markup Delimiters, Element Mark Up, Attribute Mark Up, Naming Rules, Character References, Predefined Entities, Entity References, Cdata Sections, Processing Instructions, Document Type Declaration, Welformed and Valid Document, DTD and Validation, Internal DTD Subset, External DTD, Developing DTD, Elements and Attributes Of DTDs:- Empty Element, Only Element, Mixed Elements, Any Element, Creating a valid document from a DTD. [11]

Text Books:

1. Young M .L, " Internet Millenum Edition" TMH, New Delhi.
2. Jackson Jeffrey C., "Web Technologies -A Computer Science Perspective", Pearson Education, 2006.

Suggested Reading

1. Noel Jerkr, " Techunedia VB Scraper VB Script Interleave course", New Delhi 1998
2. Marlin Webb, "Java Scraper, Instant JavaScript", Tata McGraw-Hill, New Delhi.
3. Eathier Kay and Houser Alan **,** **"**XML programming in 2 ½ days," IDG Books India (P) Ltd.

CA 17. 208 **Electronic Commerce** **3-1-0-4**

Total Lectures:40

1. **Electronic Commerce**: Overview and Scope, Traditional Commerce vs. Electronic Commerce, Impact of E-Commerce, Electronic Markets, Internet Commerce, e-commerce in perspective, Application of E Commerce in Direct Marketing and Selling, advantages and disadvantages, and future of E-commerce. [7]

2. **Business strategy in an Electronic Age:** Value Chains, Supply chain, Porter's value chain Model, Inter Organizational value chains, Strategic Business unit chains and industry value chains. [6]

3. **Business to Business E-Commerce**: Inter-organizational Transitions, Credit Transaction Trade Cycle, a variety of transactions. Electronic Data Interchange (EDI): Introduction, Benefits of EDI, EDI Technology, EDI standards, EDI Communication, EDI Implementation, EDI agreement, EDI security. [7]

4. **Electronic Payment System:** Introduction, Online Payment System, Prepaid Electronic Payment System, Post Paid Electronic System, E-Cheques, Credit Cards, Smart Cards, E-Purses, Debit Cards, Legal Risk of E-Payment System. [8]

5. **Securing Network Transaction:** Security Policy, Procedures and Practices, Transaction Security, Cryptography Algorithm, Public Key Algorithm, Authentication Protocol, Digital Signature, E-Mail Security.

6. **Case Study:** Different case studies of E commerce [5]

CA 17. 364 **Artificial Intelligence** **3-1-0-4**

Total Lectures: 40

1. **Overview of A.I.:** Introduction to AI, Importance of AI, AI and its related field, AI techniques.

[4]

2. **Problem space and search**: Defining the problem as a state space search, Production system and its characteristics, Issues in the design of the search problem.

[5]

3. **Heuristic search techniques** : Generate and test, hill climbing, best first search technique, problem reduction, constraint satisfaction

[6]

4. **Game Playing** : Minimax , alpha-beta pruning.

[4]

5. **Predicate logic**: Definition, representation of simple facts in logic, well formed formula, resolution.

[8]

6. **Knowledge representation**: Definition and importance of knowledge, Knowledge representation, Various approaches used in knowledge representation, Issues in knowledge representation.

[8]

7. **Learning:** Introduction learning, Types of learning, Introduction to neural networks.

[5]

Text Book:

1. Rich Elaine and Knight Kevin , Artificial Intelligence, Tata McGraw – Hill, 3rd edition, 2012

Reference Books:

1. Russell Stuart and Norvig Peter, Artificial Intelligence: A Modern Approach, Prentice Hall; 3 edition,2009

2. Patterson D.W., "Introduction to AI and Expert Systems", PHI, 1999

CA 17. 375 **Bioinformatics** **3-1-0-4**

Total Lectures:40

1. **Introduction to Networking:** Definition and scope of networking, Basic network topology, Concept of LAN, MAN and WAN, Introduction to Internet and data transfer protocol (TCPI/P, FTP) [5]

2. **Biological Information Resources:** Introduction to biological data and database management, Biological databases – Protein databanks (Primary and Secondary databank; Sequence and structure databank), Genomic databanks (Sequence and specialized databanks). [5]

3. **Sequence Alignment:** Introduction to biological sequence alignment, Database searching, Algorithm for sequence alignment, Pairwise alignment (Needleman and Wunsch algorithm, Smith-Waterman algorithm), Multiple Sequence Alignment, Concept of Gaps, Gap penalties and scoring matrices. [7]

4. **Tools for Sequence Alignment:** FASTA, BLAST, Variations of BLAST, Alignment scores and statistical significance of database searches. [8]

5. **Genomics:** Genome, Gene structure of prokayotes and eukaryotes, Concept of ORFs, GC-content, Codon Usage, cDNAs and ESTs, Serial analysis of gene expression (Microarrays). [9]

6. **Proteomics:** Introduction to proteome and proteome analysis (2D electrophoresis, Mass spectrophotometry, Protein microarray and X-ray crystallography), Algorithm for modeling protein folding. [6]

7. **Phylogenetics:** Introduction to phylogenetics, Parsimony, Molecular phylogenetics, Methods of phylogenetic tree construction

Text Books:

1. Peruski and Peruski: The Internet and the new Biology: tools for Genomic and Molecular Research, ASM Publishing House, India.

Reference Books:

2 Higgins and Taylor, Bioinformatics, Oxford University Press, US.

CA 17. 368 **Cyber Law** **3-1-0-4**

Total Lectures:40

1. **Fundamentals of Cyber Law**: Jurisprudence of Cyber Law- Overview of Computer and Web Technology- Introduction to Indian Cyber Law- Overview of General Laws and Procedures in India; Freedom of Expression on the Internet. [10]

2. **E-commerce-Legal Issues:** Electronic Commerce –Digital Signature- Meaning; Creation of Digital Signature; Understanding how digital signatures work, Role in Information Technology; technical issues; legal issues; Crimes relating to digital signature certificates. [10]

3. **Cyber Crimes:** Meaning of Cyber Crimes –Cyber crimes under IPC, Cr.P.C and Indian Evidence Law - Cyber crimes under the Information Technology Act,2000 - Cyber crimes under International Law - Hacking Child Pornography, Cyber Stalking, Denial of service Attack, Virus Dissemination, Software Piracy, Internet Relay Chat (IRC) Crime, Credit Card Fraud, Net Extortion, Phishing etc - Cyber Terrorism - Violation of Privacy on Internet - Data Protection and Privacy ;Concept of Social Networking – Legal Implications of Social Networking [12]

4. **Intellectual Property Issues and Cyberspace : The Indian Perspective;** Overview of Intellectual Property related Legislation-Copyright law & Cyberspace; Trademark law & Cyberspace; Law relating to Semiconductor Layout & Design. [8]

Text Books:

1. Rodney D. Ryder, Guide to Cyber Laws, 2nd Edit, Wadhwa and Company, Nagpur
2. Sharma,Vakul. Information Technology law and Practice. Universal law Publishing,2011
3. Rattan, Jyoti. Cyber law. New Delhi: Bharat law House,2011.

Reference Books:

1 Seth,Kanika. Cyber Law in the Information Technology Act. Nagpur : Lexis Nexis Butterworth Wadhwa,2009
2. Rodney D.Ryder,Guide of Cyber Law,2nd Edition.
3. Faruq Ahmed,Cyber law in India.

CA 17. 369 **E-Business** **3-1-0-4**

Total Lectures:40

1. **Internet as a Business Driver:** Internet, WWW, Benefits of Internet and WWW, Difference between e-Commerce and e-Business, Mobile Internet, Internet Consumers. [8]
2. **Introduction to e-Business Trends:** Trends Driving e-Business, Customer Oriented Trends, e-Service Trends, Organizational Trends, Enterprise Technology Trends and General Technology Trends. [7]
3. **E-Business Models:** Disruptive Technology, e-Business Models, Internet Pricing, e-Cash, Online Retailing, Constructing e-Business ICT Framework. [10]
4. **Leveraging the Web for Marketing:** Business Enhancement, Framework for Web Marketing, Web Usability, Content Management, and Impact of Internet on Marketing. [9]
5. **Online Resources and Deployment:** Meta Search Engines, Boolean Searching on Internet, Best Practice Web Searching, The Invisible Web, [6]

Text Books:

1.Ravi Kalakota, Marcia Robinsion, "E-Business 2.0: Roadmap For Success", 2nd Edition, Pearson.
2.Paul Phillips, "E-Business Strategy", 1st edition, TMH.

Reference Books:

1.Colin Combe, "Introduction to e-Business", 1st Edition, Routledge
2.Azhar Kozami**, "**Business Policy and Strategic Management", 2nd Edition, Tata McGraw Hill.

CA 17. 377 Geographical Information System 3-1-0-4

Total Lectures:40

1. **Genesis and Progression:** Basic Concepts, Benefits of Computerization of Information, Users of GIS, Introduction to Real World and Data Model, Geometric Representation of objects, Levels of Measurement, Applications of GIS. [8]
2. **Vector Data Models:** Introduction, Spaghetti Model, Topology Model, Data Compression, Storing Vector Data. [7]
3. **Raster Data Models:** Necessity and Characteristics, Coding and Storage of Raster Data, Compression of Raster Data, Run Length Encoding, Chain Codes, Block Codes, Quad Tree Model, Conversion and Contrast between Vector and Raster Models. [10]
4. **Hardware and Software Requirements for GIS:** Basic Hardware Devices viz Computer, VDU, Quantizers, Printers, Plotters, etc. DBMS, Structure of Databases, Multimedia, WWW. [9]
5. **Basics of Data Collection:** Digitizing Maps, Scanning, Manual Digitizing, Arial Photographs, Photo Interpretation, Remote Sensing, Correction, Surveying. [6]

Text Books:

1. Bernhardsen Tor, "Geographic Information System: An Introduction", 3rd edition, Wiley Publication.
2. Longley Paul, "Geographic Information Systems and Science", 2nd Edition, Wiley Publication.

Reference Books:

1 Bjarne Stroustrup ,"Programming -Principles and Practice Using C++", Addison-Wesley.

2 Herbert Schildt , "C++: The Complete Reference", 4th edition, TMH.

CA 17. 366 **Information Security** **3-1-0-4**

Total Lectures: 40

1.Introduction: Information, Characteristics of Information, Security Attacks, NSTISSC security model, Concepts of Policies; procedures; Guidelines and Standards. [8]

2.Cryptography: Conventional Encryption Principles, Conventional encryption algorithms, cipher block modes of operation, location of encryption devices, Public key cryptography principles, public key cryptography algorithms, digital signatures, digital Certificates. [10]

3.IP Security: IP Security Overview, Architecture, Authentication Header, Encapsulation Security Payload, Combining Security Association, Key Management, Pretty Good Privacy, S/Mime and Types. [7]

4.Web Security and E-Commerce: Web Security Requirement, SSL and Transport Layer Security, Secure Electronic Transactions, Introduction to E-Commerce, Transactions on E-Commerce, Requirement of Security on E-Commerce. [7]

5. System Security: Recognized Security Threats, Virus, Trojan horse, Worm, Spyware, Adware, Key Logger, Denial of Services, Firewall Design Principles, Trusted Systems, Common criteria for information technology security and evaluation. [8]

Text Book:

1. William Stallings ,"Cryptography and Network Principles and Practice", Fourth Edition, , Pearson.

2. William Stallings, "Network Security Essentials (Applications and Standards)" Pearson.

Reference Books:

1. Forouzan, Mukhopadhyay ,"Cryptography & Network Security", , McGrawHill
2. Godbole "Information Systems Security", , Wiley-India
3. Shah Deven "Information Security Principles and Practice", , Wiley-India

CA 17.365 **Internet Technologies** **3-1-0-4**

Total Lectures:40

1.	**Introduction:** Layering, TCP/IP Layering, Internet Addresses, The Domain Name System, Client Server Model, Port Numbers, Implementations and Application, Programming interfaces.	05
2.	The Link Layer Ethernet and IEEE 802 Encapsulation Trailer Encapsulation, **SLIP:** Serial Line IP, Compressed SLIP, **PPP**: Point-to-Point Protocol.	04
3.	**IP**: The Internet Protocol IP Header, IP Routing, Subnet Addressing, Subnet Mask, Special Case IP Addresses.	06
4.	**Introduction to ARP**: Address Resolution Protocol and RARP: Reverse Address Resolution Protocol, ARP Packet Format, Proxy ARP, RARP Packet Format.	07
5.	**ICMP**: Internet Control Message Protocol Introduction, ICMP, Message Types, ICMP Address, Mask Request and Reply , IP Routing Routing Principles, Introduction to Dynamic Routing; . **UDP**: User Datagram Protocol UDP Header, UDP Checksum; **DNS**: The Domain Name System DNS Basics, DNS Message Format, security.	10
6.	**TCP**: Transmission Control Protocol TCP Services, TCP Header TCP Connection, Establishment and Termination, TCP Timeout and Retransmission, Repacketization; Telnet and Rlogin Remote Login Rlogin Protocol, SMTP Protocol; **FTP**: File Transfer Protocol and SMTP: Simple Mail Transfer Protocol.	08

Text Books:

1. Tannenbaum A. S., “Computer Networks”, Prentice-Hall India., New Delhi
2. Forouzan Behrouz A, “Data Communication and Networking”, TMH, New Delhi

Reference Books:

1 Sybex ,“Networking Complete”, BPB Publication, New Delhi

2. Stallings Willam, “Data and Computer Communication”, Pearson Education, New Delhi

CA 17. 362 **Knowledge Management** **3-1-0-4**

Total Lectures:40

1. **Introduction:** Definition, Evolution, Types, Implication for Knowledge Management [6]

2. **Life Cycle:** Challenges, Difference, Knowledge management system Life Cycle, Comparative Studies Between SDLC and Knowledge Management System Development, Role of Knowledge Developer. [8]

3. **Knowledge Creation and Architecture:** Knowledge Codification, Need of Codification, and Knowledge Tools for Codification, Developer Skills Set. [9]

4. **Knowledge Transfer and Internet:** Internet and Knowledge, E-Business, Ethical and Legal Issues in Knowledge Management. [8]

5. **Executive Information and support Systems**: Business Expert System and AI, OLTO & OLAP; Data Warehousing; Data Marts, Data Warehouse architecture; Tools for data warehousing. [9]

Text Books:

1. Awad, Elias M., "Knowledge Management", TMH, New Delhi

Reference Books:

1 Inmon, W. H., "Building Data Warehousing", Wiley, New Delhi

2 Han, Jiawei, Kamber, Michelinal, "Data Mining Concepts & Techniques", Harcourt India, New Delhi

Testing:

Flash editor and toolbox.
Frames and key frame concepts
Color schemes

Application programs based on above elements in different areas of computing like- Science, Business, Mathematics and other manual processes.

Testing:

Animation using shape tween and motion tween.

Application programs based on above elements in different areas of computing like- Science, Business, Mathematics and other manual processes.

Testing:

concept of layers
Understanding guide ,mask layer.

Application programs based on above elements in different areas of computing like- Science, Business, Mathematics and other manual processes.

Testing:

Animation using symbols (movie clip, graphic and buttons) and library.

Application programs based on above elements in different areas of computing like- Science, Business, Mathematics and other manual processes.

Testing:

Animation of text morphing.

Application programs based on above elements in different areas of computing like- Science, Business, Mathematics and other manual processes.

CA 16. 304 **Multimedia Technolgy** **3-0-0-3**

Total Lectures: 40

1. **Overview** - Multimedia - Definitions, Basic properties, Temporal and non temporal medium, Multimedia applications, Uses of Multimedia, Stages of multimedia project, requirements to make good multimedia, Multimedia skills and training.

   [6]
2. **Multimedia-Hardware and Software**: Production Platforms, Hardware Peripherals, Connections, Memory and Storage devices, Media software tools, Multimedia Authoring tools, Production Standards.

   [8]
3. **Multimedia building blocks**: Audio, basic sound concepts, music, speech, MIDI versus digital audio, audio file formats, sound for the web, images and graphics-basic concepts, Digital video production and editing techniques, animation-basic fundamentals, Kinematics, morphing , animation s/w tools and techniques, animation for the web.

   [10]
4. **Data Compression:** Need of Compression techniques, Difference of lossless/lossy compression techniques. Storage space and coding requirements, classification of coding, compression techniques-JPEG and MPEG.

   [9]
5. **Multimedia and Internet:** HTML and web authoring, Multimedia considerations for Internet, Design considerations for web pages ,Web Browsers, Web page makers and editors, Media Communication, Media Consumption, Media games.

   [7]

Text Book:

1. Steinmetz R., and Nahrstedt K., Multimedia - Computing, Communications and Applications, Pearson Education Asia, 2nd Ed., 2003.

References Books:

1. Buford J. F. K., Multimedia System, Addison-Wesley, 3rd Ed., 1994.
2. Vaughan T., Multimedia - Making it Work, Tata McGraw-Hill, 3rd Ed., 2002.

CA 17.367 **Network Security** **3-1-0-4**

Total Lectures:40

1 **Introduction:** Attacks, Services and Mechanisms, Security Attacks, Security Services, Integrity check, digital Signature, authentication, has algorithms. [3]

2 **Secret Key Cryptography:** Block Encryption, DES rounds, S-Boxes IDEA: Overview, comparison with DES, Key expansion, IDEA rounds, Uses of Secret key Cryptography; ECB, CBC, OFB, CFB, Multiple encryptions DES. [8]

3 **Hash Functions and Message Digests:** Length of hash, uses, algorithms (MD2, MD4, MD5, SHS) MD2: Algorithm (Padding, checksum, passes.) MD4 and 5: algorithm (padding, stages, digest computation.) SHS: Overview, padding, stages. [7]

4 **Public key Cryptography:** Algorithms, examples, Modular arithmetic (addition, multiplication, inverse, and exponentiation) RSA: generating keys, encryption and decryption. Other Algorithms: PKCS, Diffie-Hellman, El-Gamal signatures, DSS, Zero-knowledge signatures [7]

5 **Authentication:** Password Based, Address Based, Cryptographic Authentication. Passwords in distributed systems, on-line vs offline guessing, storing. Cryptographic Authentication: passwords as keys, protocols, KDC's Certification Revocation, Interdomain, groups, delegation. Authentication of People: Verification techniques, passwords, length of passwords, password distribution, smart cards, biometrics. [6]

6 **Example System:** Kerberos: purpose, authentication, serer and ticket granting server, keys and tickets, use of AS and TGS, replicated servers. Kerberos V4: names, inter-realm authentication, Key version numbers. Kerberos V5: names, realms, delegation, forwarding and proxies, ticket lifetimes, revoking tickets, multiple Realms. [4]

7. **Network Security:** Electronic mail security, IP security, Network management security. Security for electronic commerce: SSL, SET. System Security: Intruders and Viruses, Firewalls, Intrusion Detection. [4]

Text Books:

1. Atul Kahate," Cryptography and Network Security", TMH, New Delhi

2. Kaufman, C., Perlman, R., and Speciner, M., "Network Security, Private Communication in a public world" , PHI.

Reference Books:

1 Stallings, W., "Cryptography and Network Security: Principles and Practice", Prentice Hall.

2. Stallings, W., "Network security Essentials: Applications and standards", Prentice Hall.

3. Behrouz A Forouzan, "Cryptography and Network Security"; McGraw Hill;.

CA 17. 373 **Software and CASE Tools** **3-1-0-4**

Total Lectures:40

1. **Software Engineering Fundamentals :** Definition of software product and process, Software Characteristics, Components, Applications, Layered Technologies, Processes and Product, Methods and Tools, Generic View of Software Engineering, Software Crisis and Software development paradigms, [5]
2. **Software Requirements Analysis & Specification:** System specification, Software requirements specification (SRS) standards, Analysis Modeling: Difference between Data and Information, ER Diagram, Dataflow Model, Control Flow Model, Control and Process Specification, Data Dictionary [8]
3. **Software Design:** Software architecture, Modular design - cohesion and coupling, Process-oriented design, Data-oriented design, User-interface design, Real-time software design, introduction to Object Oriented Design. [7]
4. **CASE Tools, Coding and Testing** Computer-aided software engineering, Introduction to CASE, Building Blocks of CASE, Integrated Case Environment, Characteristics of good Programming languages, Introduction to Testing Process, Testing Activities like Unit, Integration & System Testing. [7]
5. **Software Reengineering:** Business Process Reengineering, Reverse Engineering, Software re-engineerin.. [5]
6. **Software Quality and Metrics:** SQA-Software Quality Assurance, Software Reliability, Software quality metrics, SQA plan, ISO 9000 and 9001 Quality Standards. [8]

Text Books:

1. Pressman R.S. , "Software Engineering", TMH.
2. Rumbaugh James ,Object Oriented Modeling and Design, Prentice Hall- Gale
3. The Unified Modeling Language User Guide - Grady Booch, James Rumbaugh, Ivar Jacobson.

Reference Books:

1 Pankaj Jalote,"An Integrated Approach to Software Engineering", NAROSA.
2 Designing Flexible Object Oriented systems with UML - Charles Ritcher
3 Fairely, R.E., "Software Engineering Concepts", McGraw-Hill
4 Object-Oriented Analysis and Design: using UML Mike O'Docherty Wiley Publication

CA 16. 303 **Software Engineering** **3-0-0-3**

Total Lectures:40

1. **Introduction:** Software Characteristics, Components and Applications, Software Engineering a layered Technology, Software life cycle models, Waterfall, Prototype, Evolutionary and Spiral Models. [8]

2. **Software Project Management:** Basic Concepts, Project Management: Core functions, support functions, Project Integration Management. [8]

3. **Software Project Planning:** Objectives, decomposition techniques: software sizing, problem based estimation, lines of code based estimation, and function point based estimation, process based estimation, Cost Estimation Models:- COCOMO, Risk Management. [8]

4. **Software Design:** Design Principles, Design Concepts:- abstraction, refinement, modularity, software architecture, structured partitioning, information hiding**,** effective Modular Design:- functional independence, cohesion and coupling, Object Oriented analysis and Design. [8]

5. **Software Testing:** Testing Fundamentals, Design of Test Cases, White box testing, Basis Path testing, Control structure Testing, Black box testing. [8]

Text Books:

1. Pressman R.S., "Software Engineering", Tata McGraw Hill Publishing Company Ltd., New Delhi.

Reference Books:

1 Jalote Pankaj,"An Integrated Approach to Software Engineering", NAROSA.
2 Sommerville, Ian "Software Engineering", Pearson Education
3 Fairely, R.E., "Software Engineering Concepts", McGraw-Hill

CA 17. 363 **System Software** **3-1-0-4**

Total Lectures:40

1. **Overview:** Language processors, data structures for language processors, assemblers, macros and macro processors, compilers, interpreters, linkers and loaders. [5]

2. **Operating System:** Functions of Operating System, Kernel, Shell, Process, Process state diagram, System Calls. [5]

3. **Assemblers:** Design of an assembler ,one pass and two pass Assembler, Databases of Assemblers, table processing [7]

4. **Macro Processors:** Importance of Macro, Macro Definition, Macro call, Macro Expansion, Conditional Macro expansion, Nesting of Macros, Functions of Macro Processor . [8]

5. **Loaders and Linkers:** Function of Loaders, loader schemes - compile and go, general, absolute, subroutine linkages, relocating loaders, direct linking loaders, binders, linking loaders, overlays, dynamic binders. [9]

6. **Compilers :** Types of Compilers, Phases of compiler design, recursion, call and return statements. [6]

Text Books:

1. Donovan J.J., "Systems Programming", New York, Mc-Graw Hill, 1972.

Reference Books:

1 Leland L Beck,"System Software, An Introduction to System Programming", Pearson Education, 13th Indian Reprint, New Delhi, 2003.

2 Dhamdhere, D.M., "Introduction to Systems Software", Tata Mc-Graw Hill 1996.

Testing:

Markup Tags
Formatting Tags
Frames
Form Elements

Programs:

Design web pages based on above Tags.
Design and formatting a form based on form elements

Testing:

Cascading Style sheets
Dragging
Dropping
Div tag.

Programs:

Based on above CSS formatting on HTML scripts.

Testing:

java Script Declaration and Expressions
Control Structure and Functions
Java Script: Properties and Methods
Array Object
Date Object
Math Object
String Object
Events in java Script: Onblur, Onclick, on change, on focus.

Programs:

Form validation through JavaScript
Program for Event handling
Working with Date and Time Functions
Program for calculator

Testing:

VBScripts String
Date and Time
Arrays
control Structure
Looping
Methods and events
data validation

Programs:

Form validation through VBScript
Program for Event handling
Working with Date and Time Functions

Testing:

XML components
DTD
Creating a Valid Document From a DTD

Programs:

Basic XML Document
Access XML document elements through programs

CA 16.301 **Web Technology** **3-0-0-3**

Total Lectures:40

1. **Introduction:** Clients, Servers, and Communication, The Internet Basic Internet Protocols, The World Wide Web, HTTP request message, response message, Web Clients Web Servers. [5]

2. **HTML:** HTML Document, Markup Tags (HTML, HEAD, TITLE, BODY, PRE, LIST, HR, BR), Formatting Tags (MARQUEE, BOLD, ITALICS, SUBSCRIPT), Linking, URL, Relative Path Vs Absolute Path names, Images, Tables, Frames, Form Elements (Text, Buttons, List, Reset, Submit, Radio buttons, Checkbox); DHTML: Cascading Style sheets, Dragging, Dropping, Layers, Div tag. [8]

3. **JavaScript:** Declaration and Expressions, Control Structure and Functions, Variable scope Global Vs Local, Object in Java Script: Properties and Methods, Array Object, Date Object, Math Object, String Object, Events in java Script: Onblur, Onclick, on change, on focus, Design of Interactive forms; [9]

4. **VBScript:** Fundamentals, Variables, String, Constant, Date and Time, Arrays, control Structure, Design making, looping, Sub procedure, Object Methods and events, data validation. [7]

5. **XML:** Overview, Comparison of XML and html, components of XML, XML document, XML declaration, Root element, An empty element, attributes, Markup Delimiters, Element Mark Up, Attribute Mark Up, Naming Rules, Character References, Predefined Entities, Entity References, Cdata Sections, Processing Instructions, Document Type Declaration, Welformed and Valid Document, DTD and Validation, Internal DTD Subset, External DTD, Developing DTD, Elements and Attributes Of DTDs:- Empty Element, Only Element, Mixed Elements, Any Element, Creating a valid document from a DTD.

[11]

Text Books:

1. Young M .L, " Internet Millenum Edition" TMH, New Delhi.
2. Jackson Jeffrey C., "Web Technologies -A Computer Science Perspective", Pearson Education, 2006.

Suggested Reading

1. Noel Jerkr, " Techunedia VB Scraper VB Script Interleave course", New Delhi 1998
2. Marlin Webb, "Java Scraper, Instant JavaScript", Tata McGraw-Hill, New Delhi.
3. Eathier Kay and Houser Alan **, "**XML programming in 2 ½ days," IDG Books India (P) Ltd.

Mody University of Science & Technology, Lakshmangarh (Sikar)

College of Engineering & Technology

Department of CSE

Course structure for

B. Tech CSE

MA-14.101 **Mathematics-I** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): NIL

Objective(s):

- To acquire fundamental knowledge of Mathematics and apply in engineering disciplines.

1. **Calculus:** Review of basic concepts, partial differentiation, Euler's theorem on homogeneous functions, Taylor's series and Jacobian, maxima and minima of functions of two variables, asymptotes, tracing of simple Cartesian curves, length of plane curves, area bounded by the curves, multiple integrals (double and triple integrals, change of order of integration), physical interpretations and applications. [16]

2. **Three-dimensional Geometry**: Direction cosines and direction ratios of a straight line, equation of a plane,plane passing through intersections of two planes, equations of astraight line, theshortest distance between two skew lines, theequation of a sphere, intersection of plane and sphere. [10]

3. **Matrix Theory**: Rank of matrix, linear dependence and independence of vectors, solution of system of simultaneous linear equations, Eigen values, Eigenvectors of a matrix, statement of Cayley-Hamilton theorem (without proof) , reduction of a matrix to diagonal form, quadratic forms, linear transformation of a quadratic form, and applications. [10]

4. **Theory of Equations**: Introduction of polynomials, therelation between roots and coefficients, Cardon's method. [4]

Outcome(s):

- After completion of the course, students would be able to apply mathematical knowledge in engineering and solve curriculum problems.

Text Books:

1. Grewal, B.S. and Grewal, J.S., Higher Engineering Mathematics, Khanna Publishers, Daryaganj, New Delhi, 43rd Edition, 2013.
2. B. V. Ramana, Higher Engineering Mathematics, Tata McGraw-Hill Publishing Company Limited, New Delhi, 3rd Edition 2008.

Reference Books:

1. Kreyszig Erwin, Engineering Mathematics, John Wiley and Sons, New York, ISBN: 04717289777/0471726478, 9th Edition, 2005.
2. Veerarajan T., Engineering Mathematics (for first year), TMH Publishing Company Limited, New Delhi, 2nd Edition 2006.

MA-14.102 **Mathematics-II** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): MA-14.101

Objective(s):

- To acquire fundamental knowledge of Mathematics and apply in engineering disciplines.

1. **Computational Methods**: Introduction and importance of numerical analysis, calculus of finite differences, interpolation schemes for equal and unequal intervals (Newton's forward and backward interpolation formulae), divided difference, interpolation for unequal intervals (Newton's divided difference and Lagrange interpolation formulae), solution of algebraic and transcendental equations by Newton-Raphson method, applications to Engineering. [13]

2. **Ordinary Differential Equations:** First order and first-degree differential equations (variable separable, homogeneous, linear, exact equations, linear differential equations of second order with constant and variable coefficients (complementary functions and particular integrals) and applications. [12]

3. **Partial Differential Equations**: Formation of partialdifferential equations, Lagrange's multipliers method for thesolution of first order differential equations, separation of variables for nonlinear differential equations and applications. [5]

4. **Vector calculus**: Vector and scalar point functions, conservative fields, gradient of scalar point functions, divergence and curl of vector point functions (Solenoidal and irrotational vectors), directional derivative of scalar point functions, work done along a curve, integration of vectors, line integral (work done), surface integral, volume integral, physical interpretations and applications. [10]

Outcome(s):

- After completion of the course, students would be able to apply mathematical knowledge in engineering and solve curriculum problems.

Text Books:

1. Grewal, B.S. and Grewal, J.S., Higher Engineering Mathematics, Khanna Publishers, Daryaganj,New Delhi, 40th Edition, 2007.
2. B. V. Ramana, Higher Engineering Mathematics, Tata McGraw-Hill Publishing Company Limited,New Delhi, 2nd Edition 2007.

Reference Books:

1. Kreyszig Erwin, Engineering Mathematics, John Wiley and Sons, New York, , 10th Edition, 2010.
2. Veerarajan T., Engineering Mathematics (for first year), TMH Publishing Company Limited, New Delhi, 5th Edition 2015.

PY-14.101 **Engineering Physics** **Total Lectures: 40**

Credit: 3-0-0-3

Prerequisite(s): NIL

Objective(s):

- To make a bridge between the physics in school and engineering courses.

1. **Modern Physics**: Introduction to black body radiation spectrum, photoelectric effect, Compton effect. Wave-particle Dualism, deBroglie hypothesis, de Broglie wavelength, extension to electron particle, Davisson and Germerexperiment,matter waves and their characteristic properties, phase velocity, group velocity and particle velocity, relation between phase velocity and group velocity, relation between group velocity and particle velocity,expression for deBr;oglie wavelength using group velocity. [8]

2. **Quantum Mechanics:** Heisenberg's uncertainty principle and its physical significance, application of uncertainty principle (non-existence of electron in the nucleus, explanation for decay and kinetic energy of electron in an atom), wave function, properties and physical significance of wave function, probability density and normalization of wave function,setting up of one dimensional time independent Schrodinger wave equation, eigenvalues and eigenfunctions, application of Schrodinger wave equation, energy eigenvalues for a free particle,energy eigenvalues and eigenfunctions for a particle in a potential well of infinite depth. [7]

3. **Electrical Conductivity in Metals**: Free–electron concept, classical free electron theoryAssumptions, drift velocity, mean collision time and mean free path, relaxation time,expression for drift velocity, expression for electrical conductivity in metals,effect of impurityand temperature on electrical resistivity of metals,Quantum free electron theory assumptions, Fermi – Dirac statistics, Fermi-energy, Fermifactor, density of states (No Derivation),expression for electrical resistivity / conductivity,temperature dependence of resistivity of metals, electron in a periodic potential, origin of theenergy gap, band theory of solids, distinction of solids into metals, semiconductors andinsulators. [8]

4. **Dielectric & Magnetic Properties of Materials**: Dielectric constant and polarization of dielectric materials, types of polarization, equation for internal field in liquids and solids (one dimensional), Ferro and Piezoelectricity,frequency dependence of dielectric constant, important applications of dielectric materials,classification of dia, para and ferro-magnetic materials, hysteris in ferromagnetic materials, soft and hard magnetic materials,applications. [7]

5. **Lasers and Optical Fibers**: Einstein's coefficients (expression for energy density), requisites of a Laser system, condition for laser action, principle, construction and working of CO_2 laser and semiconductor laser, applications of laser – Laser welding, cutting and drilling, measurement of atmospheric pollutants, holography–principle of recording and reconstruction of images, applications of holography, propagation mechanism in optical fibers, angle of acceptance, numerical aperture, types of optical fibers and modes of propagation, attenuation, application, block diagram discussion of point to point communication. [10]

Outcome(s):

- The student will be able to understand many modern devices and technologies based on lasers and optical fibers. A student can also appreciate various material properties which are used in engineering applications and devices.

Text Books:

1. S. O. Pillai, Solid State Physics, 8th Edition, New Age International, 2018.
2. V. Rajendran, Engineering Physics, TMH,2nd edition 2010.

Reference Book:

1. G. K. Shivkumar, Engineering Physics, Prism Book Pvt. Ltd,2011.

CY-14.101 **Engineering Chemistry** **Total Lectures: 40**

Credit: 3-0-0-3

Objective(s):

- To purify the most valuable natural resource of the future-water.
- To understand one of the most versatile Engineering Materials: Polymers their preparation, properties and uses.
- To develop the basics of protecting engineering materials from the natural forces.
- To understand the present-day up-to-date knowledge of the contemporary energy sources.
- To build up the basis of the future Engineering materials like superconductors, conducting organic polymers, Nanomaterials etc.

1. **Water treatment**: Hardness, types of hardness, determination of hardness by complex metric (EDTA) method, degree of hardness, boiler troubles: corrosion, sludge and scale formation, prevention of sludge and scale formation in boilers, methods of boiler water treatment: lime-soda process, permutit (zeolite) process, ion exchange methods, numerical problems based on water treatment (lime-soda process). [10]

2. **Organic and Inorganic Polymers:** Classification, functionality, types of polymerization, mechanism of addition polymerization, plastics: thermoplastic and thermosetting resins, preparation, properties and uses of Polyamides, Bakelite, Polyesters, Rubber, vulcanization of rubber, synthetic rubber viz. Buna-S, Buna-N, Butyl and Neoprene rubbers, Silicones-polysiloxanes and Sulphur based polymers. [8]

3. **Electrochemistry and Corrosion**: Classifications (Galvanic cell, electrolytic cell), types of electrodes (reference electrodes-standard hydrogen electrode, indicator electrodes- glass electrode), theorigin of electrode potential, Nernst equation of electrode potential. electromotive force, electrochemical series. corrosion: definition and its significance, theories of corrosion, mechanism of corrosion, types of corrosion, Galvanic cell, and concentration cell, water line corrosion, pitting & stress corrosion (caustic embrittlement), protection against corrosion, corrosion control (corrosion inhibitors, cathodic protection - sacrificial anodic and impressed current cathodic protection),protective metallic coatings. [10]

4. **Fuels:** Classifications of fuels, Comparison of solid, liquid & solid fuels, Calorific value of a fuel, Bomb calorimeter, determination of LCV & HCV, petroleum: origin, composition, processing, cracking, synthetic petrol, refining, reforming, knocking, unleaded petrol, LPG as a gaseous fuel, numerical problems based on combustion. [6]

5. **New Engineering Materials**: Introduction: superconductors, high and low-temperature superconductors, organic electronic materials, fullerenes and nanomaterials, industrial applications of fullerenes and nanomaterials. [6]

Outcomes: The student will be able to understand the basis of the future Engineering materials like of superconductors, conducting polymers, Nano materials etc and purification of the most valuable natural resource of the future-water

Text Books:

1. O.G. Pananna, “Engineering Chemistry” 2nd Edition, McGraw Hill Education, 2017
2. Jain and Jain, “Engineering Chemistry,” 16th Edition, DhanpatRai Publishing Company, 2013.

Reference Books:

1. C. Housecroft, A.G. Sharpe, Inorganic Chemistry, 4th Edition, , Pearson Education Limited, England, 2012.
2. Atkins, “Physical Chemistry,” 8th edition,W. H. Freeman and Company New York, 2006.
3. William D. Callister, “Materials Science and Engineering: An Introduction, Eighth Edition,.John Wiley & Sons, Inc, 2010.
4. Bokris and Reddy, “Modern Electrochemistry,” 2nd Edition, Kluwer Academic Publishers New York, 2004.

ME-14.101 **Applied Mechanics** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): NIL

Objective(s):

- This course will help the student to acquire knowledge of basic engineering mechanics concepts and enhance their ability to solve open-ended engineering problems.
- To provide the student with a clear and thorough understanding of the theory and applications of engineering mechanics, covering both statics and dynamics.
- To provide the student with a thorough understanding of the concept, drawing, and the use of free-body diagrams.
- To be able to determine the Centre of Gravity and Moments of Inertia of simple geometric shapes and understand the physical applications of these properties.
- To understand the use and be able to perform calculations related to friction forces in engineering applications.

1. **Introduction:** Idealization of Mechanics, theconcept of Rigid Body, External Forces (Body forces & surface forces), Laws of Mechanics. [3]

2. **Force Systems and Equilibrium**: Introduction to vector, Statically Equivalent Force systems,Free Body Diagram, Equations of equilibrium and their applications to thevarious system of forces. [8]

3. **Distributed Forces and Moment Of Inertia**: Centroid of Composite figures, Area Moment of Inertia, Mass Moment of Inertia, Principle axes and Principle Moment of Inertia. [5]

4. **Friction:** Introduction of friction, Laws of friction, wedge, screw, belt, rolling friction. [5]

5. **Tension,Compression, and Shear:** Normal stress and strain, Linear elasticity, Hooke's Law and Poisson's Ratio, Shear stress and shear strain, Relationship between modulus. [4]

6. **Beams:** Different support & load conditions, SFD, BMD [5]

7. **Kinematics of Particles**: Introduction, Rectilinear motion, Plane curvilinear motion, Rectangular coordinates, Tangential and normal coordinates, polar coordinates, Relative motion (Translating Axes), constrained motion of connected particles. [5]

8. **Kinetics of Particles:** Introduction, Force, Mass and acceleration, Newton's second law of motion, Equation of motion and solution of problems, Work and Energy, Impulse and Momentum. [5]

Outcome(s):

- The students shall develop the ability to identify, formulate, and solve engineeringproblems related to forces and motion.

Text Books:

1. Timoshenko, S, Young, D.H, Rao, J.V, Engineering Mechanics, 4th edition TMH, 2010.
2. Merian, J.L, Kraige, L.G., Engineering Mechanics Vol I & II, 7th edition Wiley India 2015.

Reference Books:

1. Hibbeler, Gupta R. C., Engineering Mechanics, 11th ed.,Pearson India, 2010.

EE-14.101 **Elements of Electrical Engineering** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): NIL

Objective(s):

- This course facilitates the students to get a comprehensive exposure to various concepts and devices of electrical engineering.

1. **Introduction:** Background, major inventions, scope, significance and job opportunities in electrical engineering,brief overview of various energy resources. Apparatus used in generation, transmission, and distribution of electrical power and various industries. [3]

2. **D.C. circuits:** Review of circuit elements, voltage sources, current sources, ohms law,KVL, KCL, source transformation, mesh current and node voltage analysis of circuits. [5]

3. **Network Theorems**: Superposition theorem, Thevenin's theorem, Norton's theorem, Maximum Power Transfer theorem, star-delta transformation. [6]

4. **Single phase A.C. circuits:** Basic terminologies, average &RMS values of a.c. quantities, phasor representation, theresponse of R, L, C and their combination to a.c. excitation, theconcept of power and power factor in a.c. circuits. [6]

5. **Three phase A.C. circuits:** Three phase supply, phase sequence, star connection, delta connection, therelationship betweenphase andline quantities in 3-phase circuits, measurements of three-phase power underbalanced condition. [6]

6. **Magnetic Circuits & Transformer**: Magnetic circuit, mutually coupled circuit, Transformer: working principle, emf equation, ideal & practical transformer, equivalent circuits, transformer testing: open circuit and short circuit test, losses, voltage regulation and efficiency. [8]

7. **Rotating Machines:** Electro-mechanical energy conversion, introduction to rotating machines and applications [6]

Outcome(s):

- The students shall develop an insightful knowledge on various fundamental elements and devices of electrical engineering.

Text Books:

1.Nagrath& Kothari, Theory and Problems of Basic Electrical Engineering, 2nd edition PHI Publication,2017.
2. Fitzgerald & Kingsley, Basic Electrical Engineering, 6th edition TMH publication,2002.

Reference Books:

1. H.Cotton, Advanced Electrical Technology, CBS Publication,2005.

EC-14.101 **Basics of Electronics Engineering** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): NIL

Objective(s):

- This course would facilitate the learner to acquire good exposure to electronics and communication engineering.

1. **Introduction:** Brief history of major inventions, scope, significance and job opportunities in electronics and communication engineering, Overview of various specializations in ECE, Electronic testand measurement equipment's, Specifications for electronic components. [3]

2. **Semiconductors:** Material and its properties, Formation of energy band diagram, Currents in semiconductors, Fermi-Dirac energy distribution, Types of semiconductors – Intrinsic and Extrinsic, Mass action law, Hall effect. [5]

3. **Diodes:** Introduction, Characteristic of ideal and real diode, Current components in thediode, load characteristics, Breakdown in thediode, Zener diode, Varactor diode, Tunnel diode, Clippers and Clampers, Rectifiers – Half and Full-wave rectifiers. [8]

4. **Transistors:** Introduction to PNP and NPN transistors, current components, active, cutoff and saturation regions, CC, CB and CE configuration, Operating point, Biasing circuits, Bias Stability, Thermal runway and thermal stability. [8]

5. **Signals:** Definition, Classification of signals – Analog and Digital, Deterministic and Random signals, Power and Energy of signals, Bandwidth, Bit and Baud rate. [4]

6. **Basics of Communication**: Definition, Block representation of communication system, Modulation – Definition, Need for modulation, Frequency translation, Types of modulation - Analog and Digital, Multiplexing – TDM and FDM. [6]

7. **Applications of Communication**: Introduction to - Optical Fiber, Transmission line, Waveguides, Satellite communication, and RADAR. [6]

Outcome(s):

- The learners are expected to have an overview of electronics and communicationengineering and learn the introductory concepts in each of the specializations in ECE.

Text Books:

1. George Kennedy, Bernard Davis, Electronics Communication Systems, 4th Edition, Tata McGraw-Hill, 2009.
2. Behrouz Forouzan, Data Communication, and Networking, 5th Edition, McGraw-Hill, 2012.
3. Robert L. Boylestad, Louis Nashelsky, Electronics Devices and Circuits Theory, 11th Edition, Prentice Hall,2013.

Reference Books:

1. David A. Bell, Electronics Devices, and Circuits, PHI, 4th edition, 2008.
2. Wayne, Tomasi, Advanced Electronic Communication Systems, 6th edition, PHI, 2013.

CS-14.101 **Programming Language** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): NIL

Objective(s):

- To learn principles of programming by the structured native language 'C'.
- To comprehend the rudiments, constructs, syntax, and statements with essentials of efficient compiling, running and debugging processes.

1. **Introduction:** The role of programming languages, programming paradigms, language description and syntax structure, basics of structured programming, object-oriented programming, functional programming, logic programming, concurrent programming. [10]

2. **Fundamentals of 'C' language** : Character set, variables data types constants, arithmetic,relational and logical operators, type conversion,increment,decrement, bitwise and assignment operators, conditional expressions, statements and blocks, *if-else*,*switch*, loops-*do-while*, *while*, *for*; *break*, *continue* and *goto* statements, labels. [10]

3. **Functions, pointers and Arrays**: Basics of functions, automatic, external, static and register variables, scope rules, and header files, recursion and C preprocessor, arrays, pointers and addresses, pointers and arrays address arithmetic, character pointers and functions, pointer arrays, pointers to functions, pointers and multidimensional arrays, command line arguments. [10]

4. **Structures, unions and file processing:** Basics of structures, structures, and functions, arrays of structures, pointers to structures, self-referential structures, unions, bit fields, theconcept of files, standard input and output, formatted output, file access in different modes, reading from and writing to a file. [10]

Outcome(s):

- Students would be able to apply learning and knowledge of C language analytically, critically and logically to solve mathematical, scientific and real-life problems in an efficient manner.

Text Books:

1.Brain W. Kernighan and Dennis M. Ritchie, The C Programming Language, Second edition, Pearson Education, 2013,

2.Ravi Sethi&K.V.Viswanatha, Programming Languages-Concepts, and Constructs, Second edition, Pearson Education,2013,

Reference Books:

1.Herbert Schildt, C: The Complete Reference, Fourth Edition, McGraw-Hill Education, 2017

2.E Balagurusamy, Programming in ANSI C, Tata McGraw - Hill Education,6th edition,2012

ME-14.111 **Computer Aided Engineering Drawing** **Total Lectures: 40**

Credit: 0-0-4-2

Prerequisite(s): NIL

Objective(s):

- To improve the visualization skills.
- To enable the students with various concepts like dimensioning, conventions and standards related to working drawings in order to become professionally efficient.
- To impart the knowledge of understanding and drawing of simple engineering products.

1. **Introduction to Computer Aided Sketching**: Introduction, Drawing Instruments and their uses, BIS conventions, Lettering, Dimensioning and freehand practice. Board Drawing vs. Computer- Aided Drawing. Introduction to Solid works Environments. Computer screen, thelayout of the software, standard toolbar/menus and description of most commonly used toolbars, navigational tools. Co-ordinate system and reference planes. Definitions of HP, VP, RPP &LPP. Creation of 2D/3D environment. Selection of drawing size and scale. Commands and creation of Lines, Co-ordinate points, axes, dimensioning, line conventions, material conventions and lettering. [8]

2. **Orthographic Projections**: Horizontal planes, Vertical planes, Front view, Top view, Side view, Projections, theFirst and Third angle of projection, Projections of points, Principles of orthographic projections, Sketching of different views of given objects. Introduction to sketching in Solid works : 2-Dimensional Sketching, Sketching in Solid works, poly-lines, square, rectangle, polygons, splines, circles, ellipse, text, move, copy, off-set, mirror, rotate, trim, extend, break, chamfer, fillet, curves, constraints viz. tangency, parallelism, inclination, and perpendicularity. [12]

3. **Projections of Lines, Planes, and Solids**: Lines inclined to both the principal planes, theprojection of Lamina inclined to both principal planes, Projections of solids: Axis inclined to both the reference planes and Intersection of solids. Introduction to thepart module in Solid works: Extrude, Revolve, Sweep, Hole, Filleting, and Chamfering features. [12]

4. **Sections of solids and sectional orthographic views:** Sectional orthographic projections - Full,Half, Partial, revolved and removed surfaces. Introduction to drawing module in Solid works:Standard 3 views, Auxiliary view, Section View, Projected view. [12]

5. **Isometric Projection:** Terminology, Isometric scale, Box method, Coordinate or offset method, Four-center method, theisometric projection of arcs. Solid models practice using Solid works partmodule. [8]

Outcome(s):

- Students will be able to improve their visualization skills so that they can apply these skills in developing new products.
- Students will be able to know and understand the conventions and the methods of engineering drawing using Solid works.
- Students will be able to prepare simple drawings of engineering products.

Text Books:

1. N.D. Bhatt, "Engineering Drawing",Charotar Publishing House, 2017.
2. Prof. Sham Tickoo, Sandeep PremDass Solid works 2013 for Engineers and Designers Wiley Publication, 2017.

Reference Books:

1. Randy H. Shih, Solid works 2017 and Engineering Graphics: An Integrated Approach, SDC Books: Publications. 2017
2. David Planchard, "Engineering Graphics with Solid Works 2014 and Video Instruction", SDC Publications, 2013.

CS-14.111 **Programming Lab** **Credit: 0-0-2-1**

Prerequisite(s): NIL

Objective(s):

- To learn the implementation of programming language.

1. **C- Language Basics**: 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.
2. **Control Statements**: 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.
3. **Functions:** 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.
4. **Arrays:** 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.
5. **Pointers:** 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.
6. **Structure and Union**: 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.
7. **I/O and File Structure**: 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.

Outcome(s):

- The students will be able to implement efficiently the logic into a program.

PY-14.111 **Physics Lab** **Credit: 0-0-2-1**

Prerequisite(s): NIL

Objective(s):

- To make the students gain practical knowledge to co-relate with the theoretical studies.

1. To study the material constant, temperature coefficient of current and Planck's constant.
2. To determine the specific resistance of a given wire by using the Carey Foster's bridge.
3. To determine the ballistic constant, K of a moving coil ballistic galvanometer with a standard capacitor of known capacity.
4. To determine the high resistance by the method of leakage of a condenser with the help of ballistic galvanometer.
5. To study the variations of resistivity with temperature and hence determines the energy band gap of the given semiconductor with help of four probe method.
6. To convert a galvanometer into a voltmeter of a given range.
7. To convert a galvanometer into an ammeter of a given ranges.
8. To plot graph showing the variation of magnetic field with distance along the axis of a circular coil carrying current and to estimate from it the radius of the coil.

Outcome(s):

- After completion of the course, students would be able to develop the skills necessary to perform experiments in physics and acquire an experience of the methods used and analysis needed in experimental physics.

CY-14.111 **Chemistry Lab** **Credit: 0-0-2-1**

Prerequisite(s): NIL

Objective(s):

- To provide students with practical knowledge of quantitative analysis of materials by classical and instrumental methods for developing experimental skills in building technical competence.

1. To determine the Total, Temporary and permanent hardness of water by EDTA method.
2. To determine the % of available chlorine in a sample bleaching powder.
3. To determine the alkalinity of given water sample.
4. To prepare urea formaldehyde resin.
5. To determine the Calorific value of a fuel by bomb calorimeter.
6. Determination of the strength of HCl by titrating it against NaOH pH metrically.

7.Determination of the strength of HCl by titrating it against NaOHconductometrically.

Outcome(s): On completion of this course, students will have the knowledge in

- Handling different types of instruments for analysis of materials using small quantities of materials involved for quick and accurate results.
- Carrying out different types of titrations for estimation of concerned in materials using comparatively more quantities of materials involved for good results.

ME-14.112 **Mechanical Workshop** **Credit: 0-0-2-1**

Prerequisite(s): NIL

Objective(s):

- To learn various hand tools used in fitting, carpentry and sheet metal shop.
- To learn about lathe and drilling machine and their operations.
- To learn how various joints are made using wood and other metal pieces.

1. Fitting Shop: Prepare job that contains various fitting operation like filing, marking, measuring, cutting, drilling etc.

2. Carpentry Shop: Making of carpentry joint (T, L joint etc).

3. Sheet Metal Shop: Making job from thesheet (funnel, tray etc).

4. Machine Shop: Perform various operations like turning, step turning, facing, chamfering, knurling etc. on Lathe.

Outcome(s): Students will able to:

- Understand use of tools of Fitting, Carpentry & Sheet Metalworking operations
- Study and practice on lathe and drilling machine and their operations
- Acquire engineering skills in Fitting, Carpentry & Sheet Metalworking operations

EE-14.111 **EEE Lab** **Credit: 0-0-2-1**

Prerequisite(s): NIL

Objective(s):

- The objective of this course is to introduce the students to the basic concepts of Electronics Engineering.
- The aim of this course is to study the fundamental aspects of Electronics Engineering.
- To acquire the knowledge of hardware and verify the results on Multisim software.
- This lab facilitates the students to get a comprehensive exposure to operations of AC and DC machines, measurements of various parameters and applications of electrical machines.

Practical to be performed on Hardware:

1. Introduction to basic electronics components and study of breadboard, CRO, function generator, multimeter, and D.C. power supply.
2. To plot VI characteristics of p-n junction diode and Zener diode.
3. To design a half wave rectifier with and without filter circuit and find the ripple factor.
4. To design a full wave rectifier with and without filter circuitand find the ripple factor.
5. Study of clipper and clamper circuits and implement on abreadboard.
6. To perform soldering and de-soldering to make abanana probe, BNC probe, and connection on PCB.
7. To conduct open circuit test and short circuit test on single phase transformer and to determine equivalent circuit parameters.
8. Measurement of three-phase power by using two wattmeter methods.
9. Speed control of DC machine by field current control method.
10. To construct a fluorescent tube wiring and to measure thevoltage across tube rod, thevoltage across choke and current.

Practical to be performed using Multi-Sim Software:

1. An Introduction to Electronic Circuit Simulation using **Multi-Sim Software**.
2. To verify Ohm's law and Kirchhoff's law.
3. Simulate half wave and full wave bridge rectifier.
4. To plot VI characteristics of p-junction diode

Outcome(s): After completion of the course, students would be able to:

- To use the technique, skills, and modern engineering tools necessary for engineering practice.
- Able to explain the basic concepts of basic electronics components.
- Able to describe& explain Clipper and Clamper circuits, V-I Characterization of p- n junction & Zener diode.
- The students shall develop an insightful knowledge on various ac and dc machines with their industrial applications.

CS-14.201 **Discrete Structures** **Total Lectures: 40**
Credit:3-1-0-4

Prerequisite(s): None

Objective(s):
- To Introduce fundamental concepts and applications of discrete structure in the field of computer science

1. **Sets, Relations and Functions**: Set theory, combination of sets, multi-sets, ordered pairs, set identities, relations, operations on relations, properties of relations, composite relations, equality of relations, order of relations, functions, classification of functions, operations on functions, recursively defined functions. [8]
2. **Partially Ordered Sets:** Definition, combination of partial order sets, Hasse diagram, lattices: definition, properties of lattices: bounded, complemented, modular and complete lattice, morphisms of lattices. [6]
3. **Algebraic Structures:** Groups, subgroups and order, cyclic groups, cosets, Lagrange's theorem, normal subgroups, permutation and symmetric groups, group homomorphisms, rings, fields, integers modulo n. [6]
4. **Propositional Logic:** Proposition, well formed formula, truth tables, tautology, satisfiability, contradiction, algebra of proposition, theory of inference, natural deduction, predicate logic: first order predicate, well formed formula of predicate, quantifiers, and inference theory of predicate logic. [7]
5. **Counting:** Basic principles, permutations, combinations, summations, principle of inclusion and exclusion, pigeon-hole principle, generating functions and recurrence relations. [6]
6. **Graph Theory:** Graphs, isomorphic and homomorphic graphs, subgraphs, Eulerian chains and cycles, Hamiltonian chains and cycles, graph traversal algorithms, chromatic number, plannar graph. [7]

Outcome(s): On the successful completion of the course, the student will be able to:
- Understand the theory and techniques of logic, graphs and trees, and algebraic systems.
- Apply the knowledge and skills obtained to investigate and solve a variety of discrete mathematical problems.

Text Books:
1. Bernard Kolman, Robert C., Busb Sharon, Cutler Ross, Discrete Mathematical Structures, PHI, 6th Edition, 2009.
2. Kenneth H. Rosen, Discrete Mathematics and Its Applications, Tata McGraw- Hill, 7th Edition, 2011.

Reference Books:
1. Swapan Kumar Chakraborty, BikashKanti Sarkar, Discrete Mathematics, Oxford Higher Education, 2011
2. C. L. Liu, D. P. Mohapatra, Elements of Discrete Mathematics A Computer Oriented Approach, Tata Mcgraw-Hill, 3rd Edition, 2008.

CS -14.203 **Data Structures** **Total Lectures: 40**
Credit:3-0-0-3

Prerequisite(s): CS-14.101(Programming Language)

Objective(s):

- To provide knowledge of ways of structuring and operating on data, the nature of some fundamental problems, methods for addressing those problems, and to promote an analytical and empirical appreciation of the behavior of algorithms using data structures

1. **Introduction:** Basic terminology, elementary data organization, algorithm, efficiency of an algorithm, time and space complexity, asymptotic notations, time-space trade- off, abstract data types. [4]
2. **Array:** Definition, single and multidimensional arrays, representation of arrays: row major order, and column major order, application of arrays, sparse matrices and their representations. [4]
3. **Searching & Sorting:** Sequential search, binary search, comparison and analysis, hash function, collision resolution strategies, insertion sort, selection sort, bubble sort, quick sort, merge sort, heap sort, radix sort. [6]
4. **Linked list:** Singly linked lists, doubly linked list, circular linked list, insertion, deletion, traversal, polynomial representation and addition, generalized linked list. [6]
5. **Stack:** Primitive stack operations: push and pop array and linked list implementation of stack, application of stack: prefix and postfix expressions, evaluation of postfix expression, recursion, and tower of Hanoi problem. [4]
6. **Queue:** Queue operations, circular queues, array and linked list implementation of queues, dequeue and priority queue [4]
7. **Tree:** Binary trees, binary tree representation, tree traversal algorithms: inorder, preorder and postorder, threaded binary trees, Huffman algorithm, binary search trees AVL trees. [6]
8. **Graph:** Terminology, sequential and linked representations of graphs: adjacency matrices, adjacency list, adjacency multi list, graph traversal: depth first search and breadth first search, spanning trees. [6]

Outcome(s): On the successful completion of the course, the student will be able to:

- be knowledgeable of certain abstract data types (ADT)
- be able to make a critical assessment of different implementations of an ADT
- be familiar with a number of fundamental computational problems, and be aware of real world instances of those problems

Text Books:

1. Lipschutz, "Data Structures" Schaum's Outline Series, TMH, Revised Edition Feb. 2014

Reference Books:

1.Aaron M. Tenenbaum, YedidyahLangsam and Moshe J. Augenstein, Data Structures Using C and C++, PHI, 2nd Edition, 2012.

2. Horowitz and Sahani, Fundamentals of Data Structures, University Press, 2nd Edition2008.

3. Jean Paul Trembley and Paul G. Sorenson, An Introduction to Data Structures with applications, McGraw Hill, 2nd Edition, 2003.

4. G. A. V. Pai, Data Structures and Algorithms, TMH, 2008

CS -14.205 **C++ Programming** **Total Lectures: 40**
Credit:3-0-0-3

Prerequisite(s): CS-14.101(Programming Language)

Objective(s):

- To get a basic knowledge of object-oriented concepts.
- To master in programming related to classes inheritance using C++.

1. **Object Oriented Programming:** Basic concepts of object-oriented programming, Structured versus object oriented programming, merits and demerits of object oriented methodology. [5]
2. **Beginning With C++:** Preprocessor directives, Variables, data types, constants, operators, scope resolution operator, memory management operators, decision and loop controls, arrays, strings, functions [5]
3. **Classes And Objects:** Class definition, Structure versus class, accessing member functions within a class, data hiding, arrays within a class, static data and member functions, objects, friend functions and friend classes, constant member functions, pointers to members, constructors and destructor [7]
4. **Overloading and Exception Handling:** Definition, unary operator overloading, binary operators overloading, overloading of new and delete operators, manipulation of string using operators, type conversion, overloading with friend functions, function overloading, error and exception handling [8]
5. **Inheritance and Overriding:** Derived and base classes, type of inheritance, Derived class constructors and destructor, overriding member functions, public and private inheritance, virtual base classes, abstract classes, this pointer, virtual functions and pure virtual functions, static and dynamic bindings [8]
6. **I/O Streams and The Standard Library:** Header files, I/O stream library, stream I/O for objects, File I/O. [4]
7. **Templates:** Class templates, function templates, overloaded function templates, member function templates. [3]

Outcome(s): On the successful completion of the course, the student will be able to:

- To gain the basic knowledge on object oriented concepts.
- To understand the role of inheritance, polymorphism, dynamic binding and generic structures in building reusable code.
- To implement features of object oriented programming to solve real world problems.

Text Books:

1. Herbert Schildt, "C++: The Complete Reference "4th edition, TMH July 2017.
2. Robert Lafore, "Object-Oriented Programming in C++", 4th edition, SAMS.

Reference Books:

1. Bjarne Stroustrup,"Programming-Principles and Practice Using C++", Addison-Wesley,4th Edition 2013
2. E. Balagurusamy,"Object Oriented Programming With C++",5thedition 2011, TMH

CS-14.207 **Computer Information Systems** **Total Lectures: 40**
Credit:3-0-0-3

Prerequisite(s): None

Objective(s):
- To give essential knowledge about computer information system and its components

1. **Introduction:** Evolution of computers, generation of computers, classification of computers, block diagram of digital computers, memory unit, ALU,CPU, I/O devices, basic bus architecture, software classification, machine language, assembly languages and high level languages, assembler, compilers and interpreters, process of compilation, programming language generations, introduction to operating systems and role of the operating system. [8]
2. **Digital Logic:** Introduction to Boolean algebra and logic gates, K-map representation and Boolean function simplification, number systems: conversion from one number system to another, binary operations, complement representation of numbers, alphanumeric codes, floating point representation of numbers, floating point arithmetic operations. [6]
3. **Digital Circuit Building Blocks:** Adders, subtractors, comparators, encoders, decoders, multiplexers, de-multiplexers, latches, flip-flops, master slave flip flops, shift registers and counters. [10]
4. **Internet Technologies**: Introduction to computer networks, Internet, WWW and E-mail, web browsers, introduction to LAN,MAN, WAN, introduction to the design of web pages, HTML tags and CSS, web servers, server scripting, XML. [8]
5. **Software Development:** a systematic approach to program design, coding, testing, and debugging, application of these skills to the construction of robust programs, use of programming environments and tools to aid in the software development process. [6]
6. **Computers and Society**: Impact of computers in social life, education, business, issues of security and privacy, computer ethics. [2]

Outcome(s):
- On successful completion of this course, students will be able to take specialized courses with strong fundamentals of Computer Information Systems.

Text Books:

1. P.K. Sinha, Computer Fundamentals, BPB Publications, 6th Edition, 2017
2. M. Morris Mano, Digital Logic & Computer Design, Pearson, 2nd Edition, 2010
3. Roger S. Pressman, Software Engineering: A Practitioner's Approach, McGraw-Hill Higher Education, 8th Edition, 2014
4. Thomas Powell, HTML and CSS: The Complete Reference, Tata McGraw-Hill, 5th Edition, 2010

Reference Books:

1. Andrew S.Tanenbaum, Computer Networks, Pearson Education, 5th Edition, 2013
2. Rajaraman, Fundamentals of Computers, PHI, 6th Edition, 2014

MA 14.201 **Applied Mathematics** **Total Lectures: 40**
Credit:3-1-0-4

Prerequisite(s): None

Objective(s):
- To acquire fundamental knowledge of linear programming, numerical methods, complex analysis and integral transform and apply in engineering disciplines.

1. **Linear Programming:** Introduction**,** graphical method (bounded & unbounded solutions), Simplex method, artificial variable technique (Two phase method, Big –M method); Assignment problem (Hungarian method); Transportation problem (Vogel's approximation method). [12]
2. **Numerical Methods:** Solution of system of equations (Gauss elimination and Gauss – Seidel methods); Solution of algebraic and transcendental equations (Bisection, Ramanujan's and Regula Falsi methods), solution of ordinary differential equation (Euler's modified, Milne's predictor & corrector Runge-Kutta methods) [10]
3. **Complex Analysis:** Function of complex variable, analytic function, Cauchy- Riemann equations (without proof), integration of complex functions, line integrals in the complex plane, Cauchy integral theorem(without proof), Cauchy integral formula (without proof), zeros and singularities of complex functions, residues. [6]
4. **Integral Transform**: Laplace transform and inverse Laplace transform, first and second shifting theorems, convolution theorem (without proof), solution of ordinary differential equations with initial conditions by Laplace transforms, Fourier series of periodic functions, even and odd functions, Fourier half-range series, basics of Fourier transform. [12]

Outcome(s):
- After completion of the course, students would be able to apply the knowledge of linear programming, numerical methods, complex analysis and integral transforms in engineering and solve curriculum problems.

Text Books:

1. Ramana B.V., Higher Engineering Mathematics, TMH,2nd 2007.
2. Grewal B.S. & Grewal J.S., Higher Engineering Mathematics, Khanna publishers, 40th Edition: 2007.
3. Taha H.A., Operation Research: An Introduction, Pearson,8th edition 2006.
4. Sastry S.S., Introductory Methods of Numerical Analysis, 5th Edition, Pearson.

2. Erwin Kreyszig Advanced Engineering Mathematics, 9th Edition, Reprint 2011.
3. James B. Scarborough, Numerical Mathematical Analysis, Oxford & IBH Publishing Co. Pvt. Ltd.
4. Babu Ram, Engineering Mathematics, Pearson, Year 2010.

CS-14.225 **C++ Programming Laboratory** **Credit: 0-0-2-1**

Prerequisite CS14.111 (Programming Language Laboratory)

Objective: The objective of this lab is to provide students with an understanding of the fundamental concepts in object oriented programming and to provide the skills needed for developing the software application.

Contents: Lab manual based upon the theory course CS 14.205 and to achieve the listed course objectives and outcomes

Outcomes: Upon completion of the course students will have knowledge of the underlying the static member, friend function, operator overloading, exception handling, inheritance and polymorphism in object oriented programming application.

CS-14.223 **Data Structures Laboratory** **Credit: 0-0-2-1**

Prerequisite(s): CS-14.111(Programming Language Laboratory)

Objective(s):

- To develop skills to design and analyze simple linear and nonlinear data structures
- To Strengthen the ability to identify and apply the suitable data structure for the given real
- world problem
- To Gain knowledge in practical applications of data structures

Contents: Lab manual based upon the theory course CS 14.203 and to achieve the listed course objectives and outcomes

Outcome(s): At the end of this course, the student will

- Be able to design and analyze the time and space efficiency of the data structure.
- Be capable to identity the appropriate data structure for given problem.
- Have practical knowledge on the application of data structures.

CS 14.227 **Computer Information Systems Laboratory** **Credit: 0-0-2-1**

Prerequisite(s): CS 14.104 (Programming Language Lab.)
Objective(s): To give practical knowledge about computer information system and its components.

Content: Lab manual based upon the theory course CS 14.207 and to achieve the listed course objectives and outcomes

Outcome(s): At the end of this course, the student will be ready to take specialized lab courses with strong fundamentals of Computer Information Systems.

CS-14.202 **Java Programming** **Total Lectures: 40**
Credit: 3-0-0-3

Prerequisite(s): CS 14.101 (Programming Language)

Objective(s): The objective of this course is to:

- cover issues related to the definition, creation and usage of classes, objects and methods.
- discuss the principles of inheritance and polymorphism.
- provide the foundation of good programming skills by discussing key issues of the design of object- oriented software, including programming design and documentation.
- cover the basics of API and to explore the java abstract programming interface.

1. **Overview:** Introduction to Java, importance of Java, interactive Development Environments: Eclipse/Net Beans, basics of OOP. [4]
2. **Data Types, Variable, and Arrays:** Primitive data types, type casting, arrays, operators and control structures, identifiers, constants and literals. [6]
3. **Classes and Objects:** Class fundamentals, declaring objects, assigning object reference variables, introducing methods, constructors, this keyword, garbage collection, the finalize() method, overloading methods, using objects as parameters and return type, introducing access control, understanding static, introducing final, introducing nested and inner classes, exploring the string class, using command-line arguments. [9]
4. **Inheritance:** Inheritance basics, using super, multilevel hierarchy, constructor in hierarchy, method overriding, dynamic method dispatch, using abstract classes, using final in inheritance, the object class. [4]
5. **Package, Interfaces and Exception Handling:** Packages, access protection, importing packages, interfaces, exception-handling fundamentals, exception types, using try and catch, multiple catch clauses, nested try statements, throw, throws, finally, JAVA's built-in exceptions, user defined exception. [6]
6. **Multithreaded Programming:** The Java thread model, the main thread, creating multiple threads, threads priorities, managing threads, thread class built-in functions. [4]
7. **I/O and String Handling:** I/O basics, reading console input, writing console output, the print writer class, reading and writing files, string constructors, operations on string, string tokenizing, string buffer. [7]

Outcome(s): Upon completion of this course, students are able to:

- Understand the concepts of OOP as well as the purpose and usage principles of inheritance, polymorphism, encapsulation and method overloading.
- Identify classes, objects, members of a class and the relationships among them needed for a specific problem.
- Develop programs using the in-built Java API and the Java standard class library.
- Create Java application programs using sound OOP practices (e.g., interfaces and APIs) and proper program structuring (e.g., by using access control identifies, automatic documentation through comments, error exception handling).
- Use of development environment like Eclipse for collaborative programming

CS-14.204 **Database Management Systems** **Total Lectures: 40**
Credit:3-0-0-3

Prerequisite(s): CS 14.207(Computer Information System), CS14.203 (Data Structures).

Objective(s): The objective of this Course is to:

- Understand the fundamental concepts of database management.
- Design and Normalize databases.
- Understand transaction processing control.
- Understand basic of object concepts and object relations.
- Understand the role of the DBMS & RDBMS in the organization.

1. **Introduction:** Databases and database users, database system concepts and architecture, data modeling using the entity-relationship (ER) model, enhanced entity relationship model. [7]
2. **Relational Data Model:** Concepts, relational model constraints, relational database schemas, update operations, dealing with constraint violations, relational algebra operations, relational calculus, mapping ER model to relational model. [7]
3. **Structured Query Language (SQL)**: SQL data definition and data types, specifying constraints, schema change statements, basic queries, complex queries, update statements, views. [4]
4. **Database Design:** Functional dependencies and normalization of relational databases, first normal form (1NF), 2nf, 3nf, boyce-codd normal form (BCNF), multi valued dependency, 4NF, join dependency, 5NF. [8]
5. **Transaction Processing:** Introduction, properties, recoverability, serializability, concurrency control techniques: two phase locking protocol, concurrency control based on time-stamp ordering, database recovery techniques: recovery concepts, recovery techniques based on deferred and immediate update, the ARIES recovery algorithm. [7]
6. **Object and Object-Relational Databases:** Concepts for object databases, object database standards and design, object relational and extended relational systems. [7]

Outcome(s): After completion of the course, students will be able to:

- Analyze database models & entity relationship models. Understand architecture for database development.
- Design E-R diagram
- Use Structured Query Language (SQL) with complex queries.
- Design and normalize the relations for any organization.
- Understand transaction processing control.

Text Books:

1. Ramez Elmasri & Shamkant B. Navathe, Fundamentals of Database Management Systems, Edition, Pearson Education, 2013.

3. C.J. Date, Database Systems, Tata McGraw Hill, 2nd Edition, 2003.

MA 14.202 **Statistics and Probability Theory** **Total Lectures: 40**
Credit:3-1-0-4

Prerequisite(s): Nil.

Objective(s):

- To acquire fundamental knowledge of Statistics and Probability and apply in engineering disciplines.

1. **Introductory Ideas:** Recapitulation of Basic Probability theory; Law of addition and law of multiplication ;conditional probability; total probability; Bayes' theorem and it's applications. [6]
2. **Random Variables and Distribution:** Discrete and continuous random variables; types of distribution; probability mass and density functions; mean, variance and standard deviation of distribution. [4]
3. **Theoretical Probability Distribution:** Discrete types (Binomial) and Continuous type (Normal, Student's't'); applications of basic ideas to these distributions [8]
4. **Sampling Theory:** Sampling distribution of mean and variance; central limit Theorem. [4]
5. **Testing of Hypothesis:** Simple and Composite hypothesis; Type I and Type II errors; tests of significance and level of significance. [4]
6. **Correlation and Regression:** Simple, partial and multiple correlations; linear regression. [6]
7. **Queuing Theory and Queuing Models:** Birth and death process; pure birth and pure death process; Classification of queuing models: M/M/1, M/M/1/N, M/M/S and M/M/S/N. [8]

Outcome(s):

- After completion of the course, students would be able to apply the knowledge of Statistics and Probability in engineering and solve curriculum problems.

Text Books:

1. A.P.Baisnab and Manoranjan Jas, Elements of Probability and Statistics, TMH, 2003.

CS-14.224 Data Base Management Systems Laboratory Credit: 0-0-2-1

Pre-requisites: CS14.111 (Programming Language Laboratory)

Objective: By the end of the practical sessions of this section, students will be able to:

- Create Databases using a user interface and SQL command.
- Create Integrity and constraints on databases.
- Write SQL queries.
- Provide a practical overview of advanced concepts like triggers, assertion, views, etc.

Contents: Lab manual based upon the theory course CS 14.204 and to achieve the listed course objectives and outcomes

Outcomes: After undergoing this laboratory module, the students should be able to:

- Understand, appreciate and effectively explain the underlying concepts of database technologies.
- Design and implement a database schema for a given problem-domain.
- Populate and query a database using SQL DML/DDL commands.
- Declare and enforce integrity constraints on a database using a state-of-the-art
- RDBMS.
- Programming PL/SQL including stored procedures, stored functions, cursors, packages.

CS-14.222 **Java Programming Lab** **Credit: 0-0-2-1**

.

Prerequisite: CS 14.225(C++ Programming Lab.)

Objectives: The objective of this course is to:

- Become comfortable with object-oriented programming and learn to think in terms of objects.
- Provide the foundation of good programming skills by discussing key issues to the design of object-oriented software, including programming design patterns, documentation.

Contents: Lab manual based upon the theory course CS 14.207 and to achieve the listed course objectives and outcomes

Outcomes: Upon completion of this course, students are able to:

- Understand the concepts of OOP as well as the purpose and usage principles of
- Inheritance, polymorphism, encapsulation and method overloading.
- Create Java application programs
- Use of development environment like Eclipse for collaborative programming/editing.

CS -14.206 **Theory of Computation** **Total Lectures: 40**
Credit:3-1-0-4

Prerequisite(s): CS 14.201(Discrete Structures)

Objective(s): The goal of this course is to

- Provide students with an understanding of basic concepts in the theory of computation.
- To understand variety of issues in the mathematical development of computer science theory, particularly finite representations for languages and machines, as well as gain a more formal understanding of algorithms and procedures.

1. **Finite Automata and Regular Expression:** Finite state systems, basic definitions, regular languages and regular expression, finite automata ,Equivalence of DFA and NDFA , Kleen's theorem, pumping lemma for regular sets, regular expression with algebraic method Using Arden's Theorem, closure properties of regular sets, minimization of finite automata, Mealy and Moore machine - conversion of Mealy machine into Moore machine and vice versa. [11]
2. **Context-Free Grammars:** Context-free grammars, union, concatenation of CFG, derivation trees, simplification of context-free grammars, Chomsky normal form, Greibach Normal form, ambiguous context-free grammar. [9]
3. **Context-Free Languages and Pushdown Automata:** Pushdown automata and context-free languages, pumping lemma for CFL, closure properties of CFL, decision, algorithms for CFL. [8]
4. **Turing Machine:** Turing machine model, techniques for Turing machine construction, Turing machines as language acceptor, combining Turing machines, properties of recursive and recursively enumerable languages, universal Turing machine. [8]
5. **Chomsky Hierarchy of Languages:** Regular grammars, unrestricted grammars and Turing machines, context-sensitive grammars and linear bounded automata. [4]

Outcome(s):

- Be able to prove the equivalence of languages described by finite state machines and regular expressions.
- Be able to construct pushdown automata and the equivalent context free grammars.
- Be able to prove the equivalence of languages described by pushdown automata and context free grammars.
- Be able to construct Turing machines and Post machines.
- Be able to prove the equivalence of languages described by Turing machines and Post Machines.

Text Books:

1. Peter Linz, An Introduction to Formal Languages and Automata, Third Edition, Jones and Bartlett, 2001.
2. Hopcroft, Motwani, Ullmann, Introduction to Automata Theory, Languages and Computation, Pearson Education, Second Edition, 2005.

Reference Books:

1. Daniel I. A. Cohen, Introduction to Computer Theory, Prentice-Hall, Second Edition,1997.
2. Martin, Introduction to Languages and the theory of Computation, Tata McgrawHill, Third Edition, 2006

CS 14.270 **Comprehensive-I**

Credit: 0-0-0-3

Prerequisite(s): CS-14.101(Programming Language),CS-14.203(Discrete Structures),CS-14.205(Data Structures),CS-14.207(Computer Information System), CS-14.202(Java Programming), CS-14.204(Database Management System), CS14.206(Theory of Computation) ,CS-14.232(Computer Organization and Architecture)

Objective(s):

- To examine the understanding of the student in different fields of computer science in concise manner.

1. **Elementary Computer Science:** Software, hardware, firmware, algorithm, coding, data, information, programming methodologies, logic, software development life cycle.
2. **Digital Logic:** Logic functions, minimization, design and synthesis of combinational and sequential circuits; number representation and computer arithmetic (fixed and floating point).
3. **Computer Organization and Architecture:** Machine instructions and addressing modes, ALU and data-path, CPU control design, memory interface, I/O interface (interrupt and DMA mode), instruction pipelining, cache and main memory, secondary storage.
4. **Programming and Data Structures:** Programming in C; functions, recursion, parameter passing, scope, binding; abstract data types, arrays, stacks, queues, linked lists, trees, binary search trees, binary heaps.
5. **Databases:** ER-model, relational model (relational algebra, tupple calculus), database design (integrity constraints, normal forms), query languages (SQL), file structures (sequential files, indexing, B and B+ trees), transactions and concurrency control.
6. **Object Oriented Programming (C++ & Java):** Classes and objects, overloading, inheritance, overriding, polymorphism, exception handling, I/O streams, templates in C++, interfaces and packages in JAVA, multithreading in JAVA
7. **Automata theory:** Finite automata and regular expression, context-free languages and pushdown automata, Turing machine, Chomsky hierarchy of languages.

Outcome(s):

- At the end of this course students should be able to inspect her knowledge precisely acquired in the field of programming, data structures and databases.

CS-14.232 **Computer Organization and Architecture** **Total Lectures: 40**
Credit:3-0-0-3

Prerequisite(s): CS-14.207 (Computer Information System)

Objective(s):

- To have a thorough understanding of the basic structure and operation of a digital computer.
- To discuss in detail the operation of the arithmetic unit including the algorithms &
- implementation of fixed-point and floating-point addition, subtraction, multiplication & division.
- To study the different ways of communicating with I/O devices and standard I/O interfaces. To study the hierarchical memory system including cache memories and virtual memory.

1. **Introduction:** Von-Neuman architecture, register transfer and micro operations: register transfer language, arithmetic micro-operations, logic micro-operations, shift micro- operations, bus and memory transfers, computer organization and design: instruction cycle, computer registers, common bus system, computer instructions, addressing modes, design of a basic computer. [8]
2. **Central Processing Unit:** General register organization, stack organization, instruction formats, data transfer and manipulation, program control, RISC, CISC characteristics, pipeline and vector processing: pipeline structure, speedup, efficiency, throughput and bottlenecks, arithmetic pipeline and instruction pipeline [8]
3. **Computer Arithmetic:** Hardware implementation of addition and subtraction, multiplication algorithms, Booths multiplier, array multiplier, division algorithms, floating point arithmetic: floating point representation, add, subtract, multiplication, division. [8]
4. **Memory & I/O Organization:** Memory hierarchy, RAM, ROM chips, memory address map, memory connection, associative memory, cache memory and virtual memory: paging and segmentation, auxiliary memory: magnetic disks, magnetic tapes, Input-output interface, Asynchronous data transfer, modes of transfer, priority interrupt, DMA, IOP. [8]
5. **Hardwired and Microprogrammed Control:** Hardwired control, microprogrammed control: microinstruction, microprogram sequencing, wide-branch addressing, microinstruction with next-address field, prefetching microinstruction. [6]
6. **Advance Topics:** Case study on Pentium series processors. [2]

Outcome(s): On the successful completion of the course, the student will be able to:

- Understand basic structure of a digital computer.
- Perform arithmetic operations of binary number system.
- Know the organization of the control unit, arithmetic and logical unit, memory unit and the
- I/Ounit.

Text Books:

1. M. Morris Mano, Computer System Architecture, Pearson Education, 3rd edition, 2008.
2. Carl Hamacher, ZvonkoVranesic and SafwatZaky, Computer Organization, Tata McGraw Hill, 5th edition, 2002.

Reference Books:

1. Patterson and John L. Hennessy, Computer Organization and Design: The Hardware/ Software interface, Elsevier, 3rd edition, 2005.
2. William Stallings, Computer Organization and Architecture – Designing for Performance, Pearson Education, 6th edition, 2000.
3. John P. Hayes, Computer Architecture and Organization, Tata McGraw Hill,3rd edition,1998.

CS-14.301 **Design and Analysis of Algorithms** **Total Lectures: 40**
Credit:3-1-0-4

Prerequisite(s): CS-14.201(Discrete Structures), CS-14.203(Data Structures)

Objective(s):
- To learn the algorithm analysis techniques.
- To become familiar with the different algorithm design techniques.
- To understand the limitations of the algorithms power.

1. **Introduction:** Fundamentals of algorithms and problem solving, asymptotic notations, time complexity and analysis of algorithms, solutions of recurrence relations, master theorem and summations techniques. [8]
2. **Analysis of Sorting and Searching Algorithms:** Linear, binary and interpolation search, insertion, selection, merge, quick and heap sort, stability and other issues, hashing. [8]
3. **Algorithm Design Approaches:** Greedy method (knapsack problem, job sequencing problem), dynamic programming (assembly line scheduling, matrix chain multiplication), backtracking (8 queens problem, sum of subsets), branch and bound (0/1 knapsack problem), divide and conquer algorithms (Strassen matrix multiplication), problems based on these design paradigms. [8]
4. **Tree and Graph algorithms:** Spanning trees, Prim and Kruskal's algorithm, Huffman coding, BFS and DFS, disjoint set operations, connected components, shortest path algorithms in a graph such as Dijkstra, Bellman Ford, Warshall's etc. [8]
5. **Complexity Classes:** P,NP,NP hard and NP complete problems, reducibility, decision and optimization problems, examples of NP complete problems such as 3 CNF, clique, vertex cover and traveling salesman problem, basic introduction of approximation algorithms. [8]

Outcome(s): On the successful completion of the course, the student will be able to:
- Design algorithms for various computing problems.
- Analyze the time and space complexity of algorithms.
- Critically analyze the different algorithm design techniques for a given problem.
- Modify existing algorithms to improve efficiency.

Text Books:
3. Thomas H.Cormen, Charles E.Leiserson, Ronald L. Rivest and Clifford Stein, Introduction to Algorithms, PHI Learning Private Limited, 3rd edition, 2016.
4. Ellis Horowitz, SartajSahni, SanguthevarRajasekaran, Computer Algorithms, Silicon Press, 2nd edition, 2008.

Reference Books:
3. Anany Levitin, Introduction to the Design and Analysis of Algorithms, Pearson Education, 3rd edition, 2012.
4. Alfred V. Aho, John E. Hopcroft and Jeffrey D. Ullman, Data Structures and Algorithms, Pearson Education, 1st edition, 2006.
5. Donald E. Knuth, The Art of Computer Programming, Volumes 1& 3, Pearson Education, 2009.
6. Steven S. Skiena, The Algorithm Design Manual, Springer, 2nd edition, 2008.

CS-14.303 **Operating System** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS-14.207 (Computer Information System)

Objective(s):

- Understand the fundamental operating system abstractions like processes, threads, files, semaphores, IPC and deadlocks.
- Understand operating system from user's perspective as well as from system's perspective.
- Understand the principles of concurrency and synchronization.
- Understand basic resource management techniques.
- Understand different theoretical principles in depth through hands on high level programming.

1. **Overview:** Definition, types of operating systems: mainframe, server, multiprocessor, personal computer, real-time, embedded and smart card, system calls and utilities, batch, multiprogramming and multitasking operating system. [3]
2. **File Systems:** File concept, user and system programmer view of file systems, different modules of a file system, disk structure, disk-space allocation methods: contiguous, linked, indexed directory structures, file protection, disk scheduling algorithms. [6]
3. **Process Management:** Process concepts, threads, scheduling concepts, types of schedulers, scheduling algorithms, process state diagram, comparison of various CPU scheduling algorithms, multi-level queue scheduling. [6]
4. **Memory Management:** Logical and physical address spaces, base, limit and relocation registers, address binding, dynamic loading and linking, partitioning, swapping, contiguous memory allocation, non-contiguous memory allocation: segmentation, paging and segmentation. [8]
5. **Process Synchronization and deadlock:** Independent and concurrent processes, shared memory approach and message passing approach, mutual exclusion, synchronization, inter process communication, critical section problem and its solution to semaphores: binary and counting semaphores, wait/signal operations and their implementation, classical problems of synchronization, deadlock. [11]
6. **Case Studies:** Windows, UNIX and Linux: scheduling and memory management. [6]

Outcome(s): On successful completion of this course, students will be able to

- Analyze the primary functionalities of operating system.
- Manage system resources efficiently as an operating system designer.
- Develop new operating systems as well as work on existing ones to develop them further.

Text Books:

1. Galvin, Silberschatz, Gagne, Operating System Concepts, Wiley India, 9th edition, 2015.

Reference Books:

1. Andrew S. Tanenbaum, Modern Operating Systems - Prentice-Hall, Inc., 4th edition, 2015.
2. Deitel, Operating Systems, Pearson Education , 3rd edition, (2012 reprint).
3. **Stallings, Operating Systems: Internals and Design Principles, Pearson education, 7th edition 2013.**

CS-14.305 **Logic in Computer Science** **Total Lectures: 40**
Credit: 3-0-0-3

Prerequisite(s): CS-14.201(Discrete Structures), CS-14.207(Computer Information Systems)

Objective(s):

- To introduce the main notions of mathematical logic: logical notations (syntax) and how to assign meaning to them (semantics).
- To study formal frameworks (in the sense of being rigorous as well as in the sense of manipulating "form") for constructing logical arguments (proof theory).
- To study some deductive systems for propositional and first-order logic.
- To introduce the concept of fuzzy logic.

1. **Introduction:** Role of logic in computer science, problem representation, review of the principle of mathematical induction, the principle of structural induction, review of Boolean algebra, language, models, interpretations, validity, proof, decision problems in logic, decidability. [6]
2. **Propositional Logic:** Syntax, semantics, logical and algebraic concepts, identities and normal forms, tautology checking, propositional satisfiability, propositional resolution and tableaux method. [10]
3. **First Order Predicate Logic:** Quantifiers, first order models, validity and satisfiability, forward and backward chaining, Skolmization, normal forms, unification, Horn formulas and programs, resolution and tableaux. [12]
4. **Binary Decision Diagrams:** Representing Boolean functions, algorithms for ordered reduced binary decision diagram (OBDD), geometric templates from spatial relations, image based rendering, symbolic model checking, relational Mu-calculus, coding CTL models and specification [8]
5. **Fuzzy Logic:** Classic sets, fuzzy sets and membership, fuzzy set operations, Cartesian product, operations and properties of crisp relationship, operations and properties of fuzzy relationship. [4]

Outcome(s): On successful completion of this course, the students will be able to

- Use propositional and first-order logic.
- Apply of logic in specifying properties.
- Develop proof by induction.
- Design binary decision diagrams.
- Identify the scope for fuzzy logic.

Text Books:

2. M. Ben-Ari, Mathematical Logic for Computer Science, Springer, 2nd edition, 2003.
3. Rich E., and Knight K., Artificial Intelligence, Tata McGraw-Hill, 3rd edition, 2009.
4. C. L. Chang and R. C. T. Lee, Symbolic Logic and Mechanical Theorem Proving, Academic Press, 1st edition, 1973.

CS 14.309 **Microprocessor and Assembly Language Programming** **Total Lectures: 40**
Credit: 3-0-0 -3

Prerequisite(s): CS 14.207 (Computer Information System)

Objective(s):
- To study architecture and memory management of 8-bit and 16-bit microprocessor (8085 & 8086)
- To study assembly language programming and use it to solve various problems.

1. **Introduction:** Evolution of Microprocessor and its types, 8085 microprocessor architecture, buses, registers, flags, 8085 pin configuration & function. [6]
2. **8085 Instruction Set:** Addressing modes of 8085, 8085 instruction set, data transfer arithmetic, logical and branch instructions, 8085 interrupt structure, limitations of 8085 microprocessor. [8]
3. **Interfacing:** Memory mapped I/O, I/O mapped I/O, address decoding, interfacing of memory with 8085, interfacing of I/O with 8085. [8]
4. **Advance Microprocessors:** 8086 microprocessor architecture, 8086 pin configuration & function, addressing modes of 8086, instruction set of 8086, 8086 interrupts, study of advance processors of the family (8088, 80286, 80386, 80486 and Pentium). [10]
5. **Assembly Language Programming:** Introduction, assembler directives, looping, condition and jump, subroutines, procedures, macros, parameter passing. [8]

Outcome(s): On successful completion of this course, students will be able to:
- Draw block diagram of 8085/86 processor and know the pin function
- Know the instruction set and addressing modes
- Write the assembly language program for different problems and know the use of procedures and macros.
- Design interface of memory chips.

Text Books:
1. **Gaonkar R. S., "Microprocessor Architecture, Programming and Applications", 6th Ed., Penram International, 2013.**

4. Chhabra, "The Intel 8086/8088 microprocessor architecture programming design & interfacing", Dhanpat Rai Publication

MT 201 **Engineering Economics** **Total Lectures: 24Credit: 2-0-0-2**

Prerequisite(s): NIL

Objective(s):

- To know about the basic concepts of Engineering Economics and its role in Indian economy.
- To understand about the elements of economics with application to the industrial sector and its impact on Economy.
- To discuss about the market demand analysis, production analysis and pricing mechanism for decision making.
- To find the role of consumer perception in market demand and its features and infrastructure development in India.
- To discuss about cost analysis and optimization techniques with multiple objectives.

1. **Introduction to Engineering Economics:**Origin, principles, engineering economics and design process, engineering for economic competitiveness, engineering economy and the engineer. [3]
2. **Elements of Economics:**Definition, demand and supply, income, equilibrium, utility. [3]
3. **Economics applied to Industries:**Market demand analysis, production analysis for decision Making, cost analysis, pricing techniques in regards of goods and services, break even analysis, interest, annuities and profits. [12]
4. **Replacement Analysis:**Capital recovery, depreciation methods for replacement studies. [2]
5. **Optimization Techniques:**Economics and optimization, price mechanism and optimal resource allocation, optimization under constraints, optimization under risk and uncertainty, [4]

Outcome(s): Students would

- Be able to perform and evaluate payback period and capitalized cost on one or more than one economic alternatives.
- Be able to carry out and evaluate the benefit/cost, break even analysis on one or more alternatives.
- Have the knowledge of fundamentals of Engineering Economics for the purpose of economic condition of the country.

Text Books:

1. **Salvetore Dominick, Managerial Economics, Prentice Hall of India,6th Edition, 2008.**
2. **Christopher Thomas, S Charles Maurice, Managerial Economics, Mc-Graw Hill,11th Edition, 2012.**

Reference Book:

1. **Van Horne,James C., Fundamentals of Financial Management, Pearson Education,13thEdition, 2009.**

CS 14.315 **Python Programming** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): Programming Language (CS 14.101)

Objective(s): Python is a general-purpose, versatile and popular programming language. It's great as a first language because it is concise and easy to read, and it is also a good language to have in any programmer's stack as it can be used for everything from web development to software development and scientific applications.

5. **Introduction**: The basic elements of python, python syntax, compiled vs interpreted languages, formal and natural languages, built in python types, python as a calculator, basic input, branching programs, control structures, strings, tuples, lists and input iteration. [6]
6. **Functions and Abstraction**: Functions and scoping flow of execution, specifications, recursion, global variables, modules, stack diagrams, files, system functions and parameters, input and output, making your own module. [7]
7. **Structured Types and Higher-Order Functions**: Mutability strings, tuples, lists and dictionaries, lists and mutability, functions as Objects. [5]
8. **Classes and Object-Oriented Programming and Data Structure**: Abstract data types and classes, inheritance, encapsulation and information hiding, simple algorithms and data structures, list, tuple, sequence, set, search algorithms, sorting algorithms, hash tables. [8]
9. **Testing and Debugging**: Exceptions and assertions, types of testing – black-box and glass-box, debugging, handling exceptions, assertions. [6]
10. **Advance Python:** Regular expressions – REs and Python, plotting using PyLab, networking and Multithreaded Programming – sockets, threads and processes, chat Application, security – encryption and decryption, classical cyphers, graphics and GUI programming – drawing using Turtle, Tkinter and Python, Other GUIs. [8]

Outcome(s): Upon completion of this course students will be

- Familiar with Python syntax.
- Able to use python to implement a given logic.

Text Books:

1. John V Guttag, Introduction to Computation and Programming using Python, Prentice Hall of India, 2nd Edition, 2013.
2. Swaroop C H. , A Byte of Python, URL: https://python.swaroopch.com

Reference Books:

1. Zed A. Shaw ,Learn Python the hard way: a very simple introduction to the terrifyingly beautiful world of computers and code, Third edition, 2014.
2. Richard L. Halterman,Learning to Program with python, 2011.
3. Allen Downey ,Think Python How to Think Like a Computer Scientist, Version 2.0.17, Green Tea Press Needham, Massachusetts,2012.

CS-14.317 **Advance Web Technology** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 14.207 (Computer Information System)

Objective(s):

- To learn the platform neutral fundamentals of secure, dynamic web application development.
- To learn how to implement a web application using one specific set of open source server side tools: PHP and MySQL.

1. **Introduction:**HTTPprotocol:request and response, web browser and web servers, concepts of effective web design, web design issues including browser, bandwidth and cache, display resolution, look and feel of the website, page layout and linking, user centric design, sitemap, planning and publishing website, designing effective navigation. [4]

2. **JavaScript and XML:** Client side scripting with JavaScript, variables, functions, conditions, loops and repetition, pop up boxes, advance JavaScript: JavaScript and objects, JavaScript own objects, the DOM and web, browser environments, manipulation using DOM, forms and validations, Introduction to XML, uses of XML, simple XML, XML key components, DTD and Schemas, using XML with application, transforming XML using XSL and XSLT. [12]

3. **PHP:** Introduction and basic syntax of PHP, decision and looping with examples, PHP and HTML, arrays, functions, browser control and detection, string, form processing, files, advance features: Cookies and sessions, Object Oriented Programming with PHP. [12]

4. **PHP and MySQL:** Basic commands with PHP examples, connection to server, creating database, selecting a database, listing database, listing table names, creating a table, inserting data, altering tables, queries, deleting database, deleting data and tables, PhpMyadmin and database bugs. [12]

Outcome(s): Upon completion of the course students will be able to:

- Use the JavaScript to develop the dynamic web pages.
- Use server side scripting with PHP to generate the web pages dynamically using the database connectivity.
- Develop the modern Web applications using the client and server side technologies and the web design fundamentals.

Text Books:

1. Luke Welling, Laura Thomson: PHP and MySQL Web Development, Pearson, 2016.
2. Robin Nixon: Learning PHP, MySQL, and JavaScript, O'Reilly Media, 2012.

Reference Books:

1. Elizabeth Naramore, Jason Gerner, Yann Le Scouarnec, Jeremy Stolz, MichaelK. Glass, Beginning PHP5, Apache, and MySQL Web Development, Wrox, 2005.
2. Developing Web Applications in PHP and AJAX, Harwani, McGrawHill, 2010.
3. W. Jason Gilmore: Beginning PHP and MySQL 5 From Novice to Professional, Apress, 2010.

CS- 14.319 **Advanced Java** **Total Lectures: 40Credit: 3-1-0-4**

Prerequisite(s): CS 14.202 (Java)

Objective(s): This course extends the study of Web Programming Fundamentals. Advanced concepts of program design, implementation and testing will be introduced with J2EE framework. Student will learn various concept of advance Java for implementation of small to medium sized application programs that illustrate professionally acceptable coding and performance standards.

1. **Introduction:** OOPS principle, class and objects, basics of HTML, web development introduction, web framework, J2EE building blocks, web application structure [3]
2. **Servlets:** Servlet needs, servlet request-response model, servlet life cycle (init, service, doGet, doPost), servlet configuration, scopes (session, request, page), servlet parameters, servlet context, forms processing (get, post), HTTP header processing, HTTP responses. [5]
3. **Java Server Pages**: JSP life cycle, JSP a servlets, creating dynamic content with use of JSP elements: expressions, scriptlets& declarations, JSP composition, redirecting, forwarding, accessing default objects (request, response, session, application, config, pageContext), error processing with use of JSP, Servlets vs. JSP pages [8]
4. **Session management**: Http session, the Http session interface session tracking: cookies, hidden fields, cookies and JSP, sending and receiving cookies. [4]
5. **Using Beans and tag libraries**: Separating presentation and business logic, JSP actions, JavaBeans, working with properties, <jsp:useBean>, <jsp:getProperty> and <jsp:setProperty>,using form parameters with Beans, custom tags, types of tags. [10]
6. **Web application:** Case study of a web application, the web.xml deployment descriptor, web.xml – document definition, web.xml – adding servlets, web.xml – mapping servlets, web.xml – sending parameters, web.xml – pre-loading servlets, web application archive, deployment of web application [10]

Outcome(s): Upon successful completion of this course you should be able to:

- Demonstrate knowledge of the advance Java along with object oriented development process and apply this understanding to the analysis and design of solutions for small to medium scale problems.
- Implement web application using all the feature of J2EE covered in the course.

Text Books:

1. By Martin Bond, Debbie Law, Andy Longshaw, Dan Haywood, Peter Roxburgh, Sams Teach Yourself J2EE in 21 Days, 2nd Edition,SAMS , 2004.
2. Phillip Hanna , Osborne, JSP 2.0: The Complete Reference, 2nd edition, McGraw-Hill,2003.

Reference Book:

1. Bryan Basham, Kathy Sierra & Bert Bets, Head First Servlets and JSP, 2nd Edition, , Oreilly publication, 2008.

CS-14.321 **Windows Programming** **Total Lectures:40**
Credit : 3-1-0-4

Prerequisite(s): CS-14.101(Programming Language)

Objective(s):

- To provide knowledge of windows programming using Visual Basic .NET.
- To focus on Visual Basic program structure, language syntax and implementation details.

1. **Overview of Windows Programming:** The Windows environment, history of Windows, aspects of Windows, Windows programming options, APIs and memory [4]

models, programming environment

2. **Visual Basic 2010:** The Visual Studio development environment, writing the code, building and deploying the application, working with Toolbox control,working with specific data types, working with operators, if…then structure, select case structure, the for…next loop, using counter variable, complex for…next loop, do loops, using timer object, processing errors by using try…catch statement, using finally clause, the exception object, using nested try…catch, the exit try statement. [12]
3. **Modules and Procedures:** Working with modules, creating public variables, creating procedures, writing sub procedure, passing arguments by value,working with array, using ReDim, the array class, working with object collections, for each…next loop, creating your own collection. [8]
4. **Designing User Interface:** Managing windows forms and controls at run time, adding graphics, the system drawing namespace, adding animation to your program, inheriting forms and creating base classes, working with printers. [6]
5. **Database:** Exploring text files, reading and writing text files, getting started with ADO.NET, SQL statements and LINQ, data presentation using DataGridView control. [6]
6. **Web Programming:** Creating websites and webpages using Visual Web Developer and ASP.NET, difference between webpages and web forms, server controls, HTML controls, using webpage designer, adding server controls to a webpage. [4]

Outcome(s): Upon completion of the course the student should be

- Able to analyze program requirements.
- Design/develop programs with GUI.
- Code program and develop interface using Visual Basic .NET.
- Perform tests, resolve defects and revise existing code.

Text Books:

1. Michael Halvorson, Microsoft Visual Basic 2010, Microsoft Press, 2010
2. Bradley and Millspaugh, Programming in Visual Basic 2010, Mcgraw-Hill, 2010

Reference Books:

1. Shelly Hoisington, Microsoft Visual Basic 2010 for Windows, Web, Office and Database Applications: Comprehensive, Cengage Learning, 2010.
2. Sheldon Bill et. al., Professional Visual Basic 2010 and .NET 4, John Wiley & Sons, 2010
3. Andrew Moore, Visual Studio 2010 All-in-one for Dummies, John Wiley & Sons, 2010

CS -14.323 **Shell Programming** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): Programming Language (CS 14.101)

Objective(s):
- To familiarize students with the Unix/Linux environment
- To learn the fundamentals of shell scripting/programming
- To familiarize students with basic Unix/Linux administration

1. **UNIX-Basic Concepts:** Introduction, file systems, visual editors, Unix philosophy and features, understanding the Unix commands and general purpose utilities and navigating the file system, the shell and kernel. [8]

2. **UNIX-Advanced Features:** File and directory structures, file systems and peripheral devices, handling ordinary files, file attributes. UNIX system administration, data blocks and i-nodes. [8]

3. **Unix Editors and Filters:** Vi Editor, simple filters, regular expression and grep family, advanced filters: sed and awk, awk pattern scanning and processing, awk arithmetic, operators and variables. [8]

4. **Shell Fundamentals:** Command syntax, Shell variables, pattern matching, escaping, command substitution, input /output redirection, pipes, tees, [6]

5. **Shell Scripting:** Bourne shell, C shell; scripts, meta characters and environment, shell programming and scripts, logical operators, control and looping statements and programs. Shell reliability, maintainability, efficiency, portability and usability. [10]

Outcome(s): After completion of the course students will be able to
- Work confidently in Unix/Linux environment
- Write shell scripts to automate various tasks
- Master the basics of Unix/Linux administration
- Understand the basic difference between high level programming and shell programming

Text Books:
1. Sumitabha Das, UNIX, Tata McGraw-Hill Companies, 4th edition, 2011.
2. **Cameron Newham, Learning the bash Shell:Unix Shell Programming, 3rdedition,O'Reilly Media,2009.**

Reference Books:
1. 1. Bill Rosenblatt , Learning the Korn Shell, O'Reilly Media, 2002.
2. 2**.** Mark G. Sobell **,**A practical guide to Linux commands, editors, and shell programming, 2nded. Prentice Hall, 2013.

ET 465 **Agile Software Development** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS14.332 (Software Engineering)

Objective(s):

- To learn the fundamental principles and practices associated with each of the agile development methods.
- To learn how agile methods scale to large and distributed projects.
- To learn the essentials of collaboration as they apply to agile methods.
- To perform in-depth explorations into aspects of agile development that are particularly relevant to each student through detailed discussion sessions.

1. **Fundamentals of Agile:** The genesis of Agile, introduction and background, Agile manifesto and principles, overview of Scrum, extreme programming, feature driven development, lean software development, Agile project management, design and development practices in Agile projects, test driven development, continuous integration, refactoring, pair programming, simple design, user stories, Agile testing, Agile tools. [7]
2. **Agile Scrum Framework:** Introduction to Scrum, project phases, Agile estimation, planning game, product backlog, sprint backlog, iteration planning, user story definition, characteristics and content of user stories, acceptance tests and verifying stories, project velocity, burn down chart, sprint planning and retrospective, daily scrum, Scrum roles – product owner, Scrum master, Scrum team, Scrum case study, tools for Agile project management. [9]
3. **Agile Testing:** The Agile lifecycle and its impact on testing, test driven development (TDD), unit framework and tools for TDD, testing user stories – acceptance tests and scenarios, planning and managing testing cycle, exploratory testing, risk based testing, regression tests, test automation, tools to support the Agile tester, securing Agile software. [10]
4. **Agile Software Design and Development:** Agile design practices, role of design principles including single responsibility principle, open closed principle, Liskov substitution principle, interface segregation principles, dependency inversion principle, Agile design, need and significance of refactoring, refactoring techniques, continuous integration, automated build tools, version control. [10]
5. **Industry Trends:** Market scenario and adoption of Agile, Agile ALM, roles in an Agile project, Agile applicability, Agile in distributed teams, business benefits, challenges in Agile, risks and mitigation, Agile project on cloud, balancing Agility with discipline, Agile rapid development technologies. [4]

Outcome(s): On successful completion of this course, students will be able to

- Understand concept of agile software engineering and its advantages in software development. Recognize various agile methods.
- Design and manage a project using Scrum.
- Write user stories for project requirements.
- Write test cases for developing features.

Text Books:

1. Ken Schawber, Mike Beedle, Agile Software Development with Scrum, Pearson, 2008.
2. Robert C. Martin, Agile Software Development Principles, Patterns and Practices, Prentice Hall
3. Lisa Crispin, Janet Gregory, Agile Testing: A Practical Guide for Testers and Agile Teams, Addison Wesley.

Reference Books:

1. Alistair Cockburn, Agile Software Development: The Cooperative Game, Addition Wesley, 2006
2. Mike Cohn, User Stories Applied for Agile Software, Addison Wesley, 2004

CS-14.351 **DAA Laboratory** **Credit: 0-0-4-2**

Prerequisite(s): CS14.111(Programming Language Laboratory)

Objective(s):

- To analyze the asymptotic performance/Time complexity of algorithms.
- To demonstrate familiarity with major algorithms and data structures.
- To apply important algorithmic design paradigms, techniques and methods for the solution of real life problems.
- To synthesize efficient algorithms in common engineering design situations.

Contents: Lab manual based upon the theory course CS 14.301 and to achieve the listed course objectives and outcomes.

Outcome(s): On successful completion of this course, the students will be able to

- Evaluate and compare different algorithms using worst-, average-, and best-case analysis.
- Describe the divide-and-conquer paradigm and explain when an algorithmic design situation calls for it. Recite algorithms that employ this paradigm. Synthesize divide-and-conquer algorithms. Derive and solve recurrences describing the performance of divide-and-conquer algorithms.
- Describe the dynamic-programming paradigm and explain when an algorithmic design situation calls for it. Recite algorithms that employ this paradigm. Synthesize dynamic-programming algorithms, and analyze them.
- Describe the greedy paradigm and explain when an algorithmic design situation calls for it. Recite algorithms that employ this paradigm. Synthesize greedy algorithms, and analyze them.
- Explain the major graph algorithms and their analysis. Employ graphs to model engineering problems, when appropriate. Synthesize new graph algorithms and algorithms that employ graph computations as key components, and analyze them.
- Explain the different ways to analyze randomized algorithms (expected running time, probability of error). Recite algorithms that employ randomization. Explain the difference between a randomized algorithm and an algorithm with probabilistic inputs.
- Understand the difference between tractable and intractable problems, and to deal with them in approximation for finding the practical solutions.

CS-14.353 **Operating System Laboratory** **Credit: 0-0-2-1**

Prerequisite(s): CS14.111(Programming Language Lab.) CS 14.223(Data Structures Lab)

Objective(s):

- Learn basic operating system abstractions like process, file, page etc. through hands on programming.
- Comprehend problems of resource sharing in operating system and develop software solutions for the same.
- Work in groups to come out with solutions that require collective application of skills learnt.

Lab manual based upon the theory course CS 14.303 and to achieve the listed course objectives and outcomes.

Outcome(s): On successful completion of this course, the students will be able to

- Simulate different operating system scenarios like, process scheduling, memory management, disk scheduling, page replacement and deadlocks.
- Comprehend real life issues in operating system design and would design software level solutions for the same.
- Work in a group to come out with piecemeal solutions individually for a large problem in operating system and would be able enough to make handshaking between different modules to develop a single solution for the same.

CS 14.359 **Microprocessor and Assembly Language Programming Laboratory** **Credit: 0-0-2 -1**

Prerequisite(s): CS 14.227 (Computer Information Systems Laboratory)

Objective(s):

- To implement programs in assembly language
- To debug assembly language programs

Content: Lab manual based upon the theory course CS 14.309 and to achieve the listed course objectives and outcomes.

Outcome(s): On successful completion of this course, students will be able to:

- Solve basic arithmetic operations using the assembly language
- Write program to find smallest/largest number
- Use stack for solving various problems
- Use program counter, status register and show how these are used to execute machine code programs

CS-14.371 **Colloquium** **Credit: 0-0-0-1**

Prerequisite(s): NIL

Objective(s):

- To observe and analyze some popular technology and gain insights
- To comprehend the acquired knowledge.
- To present the acquired knowledge to larger audience.

Content: Students have to comprehend and present on some popular technology in the field of computing.

Outcome(s): On successful completion of this course, the students will be able to

- Communicate effectively to arrange of audience.
- Recognize the need for continuous learning.
- Recognize the social impact of engineering solutions.

CS-14.332 **Software Engineering** **Total Lectures:40**

Credit:3-0-0-3

Prerequisite(s): CS-14.101 (Programming Language), CS-14.203 (Data Structures)

Objective(s):

- To understand the basic software engineering approaches, software development process models, project planning, software size estimation, software effort and cost estimation and risk management.
- To know about software requirements specification, requirement elicitation, structured system analysis and introduction of object-oriented analysis and design, design techniques.
- To acquire knowledge on implementation issues such as modularity and coding standards.
- To learn coding style guidelines and standard and software testing, different type of testing strategies and their application in real time system.
- To study web based-system and application, software re-use, software re-engineering, agile software engineering, software engineering and testing tools.
- To develop teamwork and have project based experience.

1. **Introduction:** Programs versus software products, software crisis, need for software engineering, attributes of effective software, software myths, software characteristics, and role of management in software development, overview of quality standards like ISO 9001, SEI-CMM. [6]

2. **Software Processes and Requirement Analysis:** Software engineering: a layered technology, the software process, software process models, component based development, problem analysis, requirement engineering, requirement elicitation, requirement analysis, software requirement and specifications, data flow diagrams, data dictionaries, entity-relationship diagrams. [8]

3. **Software Project Planning:** Responsibilities & skills of a project manager, project planning, and project size estimation: LOC, function point & feature point metric, project estimation techniques, COCOMO model, staffing level estimation, scheduling, risk management, software configuration management. [9]

4. **Software Design:** The design process, design principles, design concepts, effective modular design: cohesion & coupling, classification of cohesiveness & coupling, design notations, design techniques, structure charts, introduction to object-oriented design. [8]

5. **Coding and Testing:** Software testing fundamentals, test case design, white box testing:-basis path testing, control structure testing, black box testing: boundary value analysis, equivalence class testing, decision table testing, cause effect graphing, level of testing, debugging, testing tools &standards, testing for client/server architecture, real time systems and GUIs testing. Brief of software re-use, reverse engineering, software re-engineering, agile software engineering. [9]

Outcome(s):

On successful completion of this course, students will be able to

- Demonstrate knowledge of the distinction between critical and non-critical systems and ability to manage a project including planning, scheduling and risk assessment/management.
- Author a software requirements document and understanding of the proper contents of a software requirements document.
- Demonstrate proficiency of different life cycle models.
- Identify specific components of a software design that can be targeted for reuse.
- Demonstrate proficiency in software development cost estimation, software testing plan and advanced topics of software engineering.

Text Books:

1. R. S. Pressman, Software Engineering – A practitioner's approach,Tata-McGraw- Hill Int. Ed., 8th edition, 2014.
2. K. K. Aggarwal, Yogesh Singh, Software Engineering, New Age International, 1st edition, 2008.

Reference Books:

1. Pankaj Jalote, An Integrated Approach to Software Engineering, Narosa Publisher, 3rdedition, 2005.
2. Rajib Mall, Fundamentals of Software Engineering, Prentice-Hall, 2ndedition, 2004.
3. Robert C. Martin, Agile Software Development, Principles, Patterns and Practices, 1st edition, 2002.

CS-14.336 **Computer Networks** **Total Lectures: 40**
Credit: 3-0-0-3

Prerequisite(s): CS-14.203 (Data Structures), CS-14.207 (Computer Information Systems)

Objective(s):

- To become familiar with layered communication architectures (OSI and TCP/IP).
- To understand the client/server model and key application layer protocols.
- To construct large-scale computer networks
- To understand fundamentals of computer networks and major protocols.
- To analysis and evaluate major Internet protocols.
- To program simple network applications using socket API
- To learn and adopt newly introduced computer network technologies by themselves.

1. **Introduction to Network Model:** History and development of computer networks, networks topologies, MANET, categories of networks, layering and protocols. [5]
2. **Physical Layer:** Different types of transmission media, transmission impairments, encoding schemes (NRZ, NRZI, Manchester, 4B/5B, Manchester etc.), packet and circuit switching. [5]
3. **MAC Layer:** Aloha, CSMA/CA, CSMA/CD protocols, performance evaluation and characteristics. [3]
4. **Data Link Layer:** Framing concept, error detection (parity, CRC), sliding window, stop and wait protocols, stop performance and efficiency. [5]
5. **Local Area Network:** IEEE 802.3, 802.4, 802.5, 802.11, performance evaluation. [5]
6. **Network Layer:** IPv4, IP address classes, classless addressing, IPv6, ARP, RARP, DHCP, ICMP, routing algorithms: distance vector, metrics, RIP, OSPF, BGP, congestion control algorithms, leaky bucket, token bucket. [8]
7. **Transport Layer:** Duties of the transport layer, connection, TCP, TCP services, TCP header, UDP, evaluating protocol such as TCP/UDP using simulator like NS2. [5]
8. **Application Layer:** DNS, FTP, HTTP, SMTP, POP, basics of network security (cryptography, digital signature and firewall). [4]

Outcome(s): On successful completion of this course, students will be able to

- Analyze computer network component and devices.
- Synthesize how communication works in a network and internet.
- Formulate the concept of topologies and their applications.
- Analyze protocol at different layers and how they play important role in network implementation.
- Identify and analyze the latest technology with existing one.
- Enumerate the layers of OSI and TCP/IP models.
- Configure network and wireless technology including client/server programming.

Text Books:

1. Tanenbaum A. S., Computer Networks, Prentice-Hall of India, 5th edition, 2010.
2. Stallings W., Data and Computer Communications, Prentice-Hall of India, 10th edition, 2013.

Reference Books:

1. **Forouzan B. A., Data Communications and Networking, Tata McGraw-Hill, 5th edition, 2013.**
2. Hayes J. F., Modeling and Analysis of Computer Communication Networks, Plenum Press, 1st edition, 1987.

CS-14.316 **Computer Graphics** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): CS-14.101 (Programming Languages), MA-14.101 Mathematics I

Objective(s):

- To introduce the students with the graphics mode, with the help of basic algorithms and methodologies.
- The objective of the course is to equip students with fundamental knowledge and basic technical competence in the field of computer graphics.
- Provide an understanding of how a computer draws the fundamental graphics primitives.
- To learn Computer Graphics methodologies/Algorithms and techniques and their implementations.

1. **Introduction to Computer Graphics and graphics primitives**: Overview of interactive graphics model, applications of computer graphics, graphics devices, random and raster scan systems, color models: RGB, YIQ, scan conversion: point, line, circle and ellipse. [7]
2. **2D Transformation and Viewing**: Basic transformations (translation, rotation, scaling), homogeneous coordinates, composite transformations, reflection and shearing, filling: scan line filling, flood filling, boundary filling, clipping: point clipping, line clipping, polygon clipping, and character generation. [7]
3. **Curves and Surfaces**: Introduction to curves, conic curves, polygon surfaces, tables, quadric surfaces, spline representation, cubic spline interpolation methods, Bezier curves and surfaces, B-spline curves and surfaces, fractals and its applications. [7]
4. **3D Transformation and Viewing**: 3D transformation, composite transformation, viewing pipeline, parallel and perspective projection, visible surface detection: classification of visible surface detection algorithms, back face detection, depth buffer method, A-buffer method, scan-line method, depth sorting method. [7]
5. **Illumination Model and Surface Rendering Techniques**: Basic illumination models, Halftone patterns and dithering techniques, polygon rendering methods, ray tracing methods. [6]
6. **Introduction to Animation and Multimedia:** Introduction to animation, key-frame animation, construction of an animation sequence, animation techniques, multimedia: introduction, features of multimedia system, components of multimedia systems and application of multimedia systems. [6]

Outcome(s): On successful completion of this course, students will be able to

- Understand basic concepts of computer graphics.
- Acquire knowledge about drawing basic shapes such as lines, circle ellipse, polygon.
- Perform processing of basic shapes by various processing algorithms /techniques.
- Implement two and three dimensional transformations.
- Apply various algorithms of clipping.
- Acquire knowledge about illumination models, color models and surface rendering.

Text Books:

1. Donald D. Hearn & M. Pauline Baker, Computer Graphics-C Version, Pearson Education, 2nd edition, 2002.
2. James D. Foley, Andries van Dam, Steven K Feiner, John F. Hughes, Computer Graphics Principles and Practice, 2nd Edition in C, Addison Wesley, 1995.

Reference Books:

1. Donald Hearn and M Pauline Baker, Computer Graphics with OpenGL, Pearson Education, 4th edition, 2010.
2. David F. Rogers, Procedural Elements for Computer Graphics, Tata McGraw Hill Publications, 2nd edition, 2001.

CS-14.318 **Artificial Intelligence** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS-14.101 (Programming Language), CS-14.207(Computer Information Systems)

Objective(s):

- To understand the basic problem solving in Artificial Intelligence.
- To learn different blind as well as heuristic search strategies.
- To understand the various ways of knowledge representation in Artificial Intelligence.
- To know the concepts of game theory and natural language processing.

1. **Overview of Artificial Intelligence:** Introduction to artificial intelligence and intelligent agents, brief history of artificial intelligence, related research fields, AI techniques, AI problems, applications of AI, future of AI, basic concepts of LISP and PROLOG. [6]
2. **Problem Solving and Search Techniques:** Basics of problem solving, Problem representation paradigms, defining problem as a state space representation, uninformed search, depth first search, breadth first search, heuristic search, heuristic functions, generate and test, hill climbing, best first search, A* algorithm, problem reduction, AND/OR graph, AO* algorithm. [10]
3. **Knowledge Representation and Logic:** Representation and mappings, procedural versus declarative knowledge, approaches and issues in knowledge representation, introduction to logic-based problem solving, Boolean logic, first order logic, higher order logic, unification and resolution for performing logical inference, fuzzy logic, probabilistic logic. [8]
4. **Game Theory:** Minimax search, alpha-beta cutoffs, iterative deepening, references on specific games. [5]
5. **Natural Language Processing:** Introduction to NLP, syntactic processing, semantic analysis, discourse and pragmatic processing. [5]
6. **Learning:** Learning from observation, rote learning, inductive learning, explanation basedlearning, statistical learning methods, supervised and unsupervised learning, basics of neural network, reinforcement learning discovery, analogy. [6]

Outcome(s): On successful completion of this course, students will be able to

- Solve the basic problems and apply searching techniques used in Artificial Intelligence.
- To select knowledge representations to solve AI problems.
- Apply various game playing algorithms.
- Work with natural language processing and apply learning techniques.

Text Books:

1. Rich E., and Knight K., Artificial Intelligence, Tata McGraw-Hill, 3rd edition, 2009.
2. Russell S., and Norvig P., Artificial Intelligence – A Modern Approach, Prentice-Hall of India, 3rd edition, 2014.

Reference Books:

1. Patterson D. W., Introduction to Artificial Intelligence and Expert Systems, Prentice-Hall of India, 1st edition, 2015.
2. George F. Luger, Artificial Intelligence: Structures and Strategies for Complex Problem Solving, Pearson Education, 5th edition, 2009.

CS-14.320 **Cryptography** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS-14.201 (Discrete Structures), CS-14.207 (Computer Information Systems)

Objective(s):

- To understand the classical encryption and decryption algorithms, their techniques as well cryptanalysis.
- To acquire basic knowledge of finite fields and number theory.
- To understand the various block ciphers, stream cipher models, principles of public key cryptosystems, hash functions and digital signatures.
- To understand the different authentication techniques.

1. **General Overview and Classical Cryptography:** General overview of threats, risks and consequences, sources of threats, attacks, classification and preventive measures, introduction to some simple ciphers such as shift cipher, substitution cipher, affine cipher, Vigener cipher, hill cipher, permutation cipher and stream ciphers, rigorous cryptanalysis of all the above ciphers. [8]
2. **Symmetric/Secret Key Cryptography:** Block ciphers and their principles- boxes, P-boxes, DES, 3 DES, AES. [6]
3. **Elementary Number Theory:** Euclid's algorithm, extended Euclid's algorithm, groups, solving modular linear equations, Chinese remainder theorem, modular exponentiation, discrete logarithm problem, prime numbers and primality testing, factorization problem, Fermat's and Euler's theorem, computation of generators of primes. [8]
4. **Key Exchange/Distribution Schemes:** Diffie - Hellman key exchange, man- in- the-middle attack,Fiat-Naor key distribution, Needham – Schroeder scheme and attack possible on it, Kerberos. [6]
5. **Asymmetric Key/Public Key Cryptosystems:** RSA description, different attacks on RSA and remedies, other public keycryptosystems such as ElGamal and Rabin cryptosystems and possible attacks on them. [6]
6. **Digital Signature Schemes:**Security requirements for digital signatures, ElGamal digital signature scheme and its security analysis, the digital signature algorithm (DSA), Schnorr digital signature scheme, provably secure signature schemes and undeniable signatures. [6]

Outcome(s): On successful completion of this course, students will be able to :

- Analyze the security threats.
- Design robust cryptographic algorithms.

Text Books:

1. Douglas R. Stinson, Cryptography: Theory and Practice, (Discrete Mathematics and Its Applications) Chapman and Hall/CRC, 3rd edition, 2005.

Reference Books:

1. Jonathan Katz , Yehuda Lindell, Introduction to Modern Cryptography, (Cryptography and Network Security Series), Chapman and Hall/CRC; 2nd edition, 2014.
2. William Stallings, Cryptography and Network Security: Principles and Practice, Pearson Education, 6th edition 2013.
3. Wenbo Mao, Modern Cryptography Theory & Practice, 1st edition, 2004.

CS-14.322 **Data Mining** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS-14.204 (Database Management System), CS-14.301(Design and Analysis of Algorithms), MA-14.202 (Statistics and Probability Theory).

Objective(s):

- Understand the functionality of the various data mining and data warehousing components.
- Appreciate the strengths and limitations of various data mining and data warehousing models.
- Compare the various approaches to data warehousing and data mining implementations
- Describe and utilize a range of techniques for designing data warehousing and data mining systems for real-world applications.

1. **Overview:**Evolution of the database system technology, concept of data mining and warehousing, data warehouse roles and structures, cost of warehousing data, approaches to data exploration and data mining, foundations of data mining, web warehousing, introduction to knowledge management and knowledge bases. [5]
2. **Data Warehouse:**Overview of data warehousing, data marts, data warehouse architecture, multidimensional data model, online analytical processing (OLAP), OLAP operations, data about data - metadata. [4]
3. **Data Mining and Data Visualization:** Data mining general approach, classification and clustering, introduction to DM tool (Weka,Rapidminer), techniques used to mine the data, current limitations and challenges to DM, data visualization, visualization tools. [6]
4. **Data Preprocessing:** Overview, data cleaning, data integration, data reduction strategies, principal component analysis, sampling, histograms, clustering, data cube aggregation, data transformation and discretization. [6]
5. **Machine Learning:**Supervised and unsupervised machine learning, market basket analysis (Apriori algorithm), fuzzy logic and linguistic ambiguity, artificial neural networks, genetic algorithms,genetically evolved networks, applications for machine learning. [7]
6. **Text Mining:**Information retrieval and search, text classification, text clustering, unsupervised learning, mining frequent patterns and correlations, classification concepts, backpropagation, decision tree induction, rule based classification, clustering basic concepts and methods, K-means centroid based technique. [6]
7. **Web Based Statistical Analysis:** Delivering information over the web, query and reporting tools and business value, business value from analytical tools, statistical analysis applications, data discovery tools overview, data discovery applications, search engines and the web, search engine architecture, future of data mining. [6]

Outcome(s): On successful completion of this course, students will be able to

- Identify, formulate, and solve data science related problems by applying principles of the course.
- Understand both analysis and synthesis in the design process with the help of data mining and data warehousing tools.
- Develop and conduct appropriate experiments, analyze and interpret data, and use data visualization to draw conclusions.
- Function effectively on teams that establish goals, plan tasks,meet deadlines, and analyze risk and uncertainty.

2. **Ian H. Witten and Eibe Frank, Data Mining: Practical Machine Learning Tools and Techniques, Morgan Kaufmann, 3rd edition, 2011.**
3. Mattison R., Web Warehousing and Knowledge Management, Tata McGraw-Hill, 1st edition, 1999.

Reference Books:

1. W.H. Inmon, BuildingtheData Warehouse, Wiley Publishing Inc., 3rdedition, 2005.
2. Anahory and Murray, Data Warehousing in the Real World, Pearson Education/Addison

Wesley, 1st edition, 1997.

3. Prabhu C.S.R., Data Warehousing, Prentice-Hall of India, 2nd edition, 2002.

CS-14.324 **Data Compression** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): MA-14.202 (Statistics and Probability Theory)

Objective(s):

- To develop theoretical foundations of data compression.
- To know the concepts and algorithms for lossy and lossless data compression.
- To understand signal modeling and its extension to compression with applications to speech, image and video processing.

1. **Introduction:** Compression techniques, measures of performance, modeling and coding, information theory, Shannon coding theory, physical models, probability models, Markov models, composite source model, fixed and variable length codes, uniquely decodable codes, prefix codes, Kraft's theorem. [10]

2. **Lossless Compression:** The Huffman coding algorithm: minimum variance Huffman codes, adaptive Huffman coding, Golomb codes, rice codes, Tunstall codes, coding a sequence, generating a binary code, comparison of binary and Huffman coding, diagram coding, dictionary based compression techniques, adaptive dictionary, LZ77, LZ78 and LZW approach, predictive coding, prediction with partial match, the Burrows-Wheeler transform, facsimile encoding, dynamic Markov compression. [10]

3. **Lossy Compression:** Distortion criteria, distortion measurement models, scalar quantization, uniform quantizer, adaptive quantization, non-uniform quantization, advantages of vector quantization over scalar quantization, the Linde-Buzo-Gray algorithm, tree structured vector quantizers, structured vector quantizers. [10]

4. **Multimedia Compression:** M-law and A-law commanding, DPCM and ADPCM audio compression, MPEG audio standard, frequency domain coding, lossless techniques of image compression, gray codes, transform coding, GIF**,** JPEG, predictive techniques, PCM and DPCM, video compression and MPEG industry standard, wavelet based compression. [10]

Outcome(s): On successful completion of this course, students will be able to

- Understand the concepts, applications and models of data compression.
- Apply the methods of lossy and lossless data compression.
- Apply the methods and standards of image, audio and video data compression.

Text Books:

1. **Khalid Sayood, Introduction to data compression, Morgan Kaufmann Publishers, 4th edition, 2012.**

Reference Books:

1. Mark Nelson and Jean-Loup Gailly: The Data Compression Book, M&T Books, 2nd edition, 1996.
2. David Salomon, Data Compression: The Complete Reference, Springer, 4th edition, 2006.

ET 471 **Cloud Computing (Infosys)** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s):
Objective(s):

1. **Overview of Cloud Computing:** Brief history and evolution - History of Cloud Computing, Evolution of Cloud Computing, Traditional vs. Cloud Computing. Why Cloud Computing, Cloud service models (IaaS, PaaS & SaaS). Cloud deployment models (Public, Private, Hybrid and Community Cloud), Benefits and Challenges of Cloud Computing. Introduction to AWS Public Cloud Vendor. Cost optimization in AWS. [10]

2. **Virtualization**: Basics of virtualization, Virtualization technologies, Server virtualization, VM migration techniques, Role of virtualization in Cloud Computing. Introduction to EC2 service of AWS. [8]

3. **Working with Private Cloud:** Private Cloud Definition, Characteristics of Private Cloud, Private Cloud deployment models, Private Cloud Vendors - CloudStack, OpenStack, Eucalyptus Microsoft, Private Cloud – Benefits and Challenges. Private Cloud implementation in Amazon EC2 service. [8]

4. **Working with Public Clouds:** What is Public Cloud, Why Public Cloud, When to opt for Public Cloud, Public Cloud Service Models, and Public Cloud Players. Infrastructure as a Service Offerings, IaaS Vendors, PaaS offerings, PaaS vendors, Software as a Service. Demonstrating public cloud with AWS – Storage and Database services. Private vs. Public Cloud – When to choose. [12]

5. **Overview of Cloud Security:** Explain the security concerns in Traditional IT, Introduce challenges in Cloud Computing in terms of Application Security, Server Security, and Network Security. Security reference model, Abuse and Nefarious Use of Cloud Computing, Insecure Interfaces and APIs, Malicious Insiders, Shared Technology Issues, Data Loss or Leakage, Account or Service Hijacking, Unknown Risk Profile, Shared security model between vendor and customer in IAAS/PAAS/SAAS, Implementingsecurity in AWS. [8]

6. **Future directions in Cloud Computing:** When and not to migrate to Cloud, Migration paths for cloud, Selection criteria for cloud deployment, Issues/risks in cloud computing, Future technology trends in Cloud Computing. [4]

Text Books:

1. Cloud Computing: Principles and paradigms By Raj Kumar Buyya, James Broberg, AndrezeiM.Goscinski, 2011
2. Cloud Computing, By Michael Miller, 2008.
3. Cloud Computing for dummies, By Judith Hurwitz, Robin Bllor, Marcia Kaufman, Fern Halper, 2009.
4. Cloud Computing: A Practical Approach, By Anthony T. Velte, Toby J. Velte, and Robert Elsenpeter, McGraw Hill, 2010.
5. Handbook of Cloud Computing, By BorkoFurht, Armando Escalante (Editors), Springer, 2010.

Reference Books:

1. Cloud computing: Implementation, management and security By Rittinghouse, John, W.
2. Cloud Computing Bible, By Barrie Sosinsky, Wiley, 2011.
3. Cloud Computing Architected: Solution Design Handbook by Rhoton, John.
4. Cloud Security, A comprehensive Guide to Secure Cloud Computing by Krutz, Ronald L.; Vines, Russell Dean

CS-14.352 **Software Engineering Laboratory** **Credit:0-0-2-1**

Prerequisite(s): CS-14.111 (Programming Language Lab),CS-14.223 (Data Structures Lab.) CS-14.351(DAA Lab), CS-14.224(Database Management Systems Lab.)

Objective(s):

- studying various phases of software development life cycle.
- Problem definition of any system (e.g. ATM system,health care, airlines, banking, insurance, retail, education or latest systems).
- Feasibility study of the system.
- Identifying the requirements from problem statements(IEEE Std:830-1993)
- Requirements, categorization of requirements, functional requirements, identifying functional requirements, non functional requirements.
- data flow diagram, graphical notations for data flow diagram, explanation of symbols used in DFD,context diagram and leveling DFD.
- Entity Relationship Model,entity set and relationship set , attributes of entity ,keys ,ER diagram ,graphical notations for ER ,estimation of projects, project metrics.
- Project estimation techniques ,COCOMO , Calculate effort using FP oriented estimation model , LOC based estimation for size oriented metrics
- Designing test suites, unit testing, integration testing, system testing, black box testing, and white box testing.
- Use some of the tools that are used in the different software development stages.

Contents:

Lab manual based upon the theory course CS 14.302 and to achieve the listed course objectives and outcomes.

Outcome(s): **On successful completion of this lab, students will be able to**

- Plan a software engineering process life cycle (SDLC Models) , including the specification, design, implementation, and testing of software systems that meet specification, performance,

maintenance and quality requirements

- Elicit, analyze and specify software requirements through a productive working relationship with various stakeholders of the project.
- Analyze and translate a specification into a design, and then realize that design practically, using an appropriate software engineering methodology and students are also able to calculate the approximate cost, time estimation of the project or system.
- Develop the code from the design and effectively apply relevant standards and perform testing, and quality management and practice, and students are also able to remove some errors, bugs, of the project or system.
- Use modern engineering tools necessary for software project management, time management.
- Apply software engineering principle for developing real life web and mobile applications.

CS-14.354 **Compiler Design Laboratory** **Credit: 0-0-2-1**

Prerequisite(s): CS 14.111(Programming Language Lab.) CS 14.223(Data Structures Lab.)

Objective(s):

- To design and implement a lexical analyzer
- To design and implement a parser
- To design and implement symbol tables
- To understand and design code generation schemes
- To learn the working of some compiler writing tools

Contents:

Lab manual based upon the theory course CS 14.304 and to achieve the listed course objectives and outcomes.

Outcome(s): On successful completion of this course, the students will be able to

- understand the peculiarities of a language translator
- get the practical approach of how a compiler works
- work in the development phase of new computer languages in industry
- understand the working of compiler construction tools
- visualize and design a new compiler of her own language

CS-14.356 **Computer Network Laboratory** **Credit: 0-0-2-1**

Prerequisite(s): CS14.111 (Programming Language Lab.), CS 14.223(Data Structures Lab.)

Objective(s):

- To implementing the client/server model with its application aspects.
- Sniffing packets in network as a network analyzer
- To implement protocols at various types communicating protocols
- To implement socket programming application with inbuilt API
- To code error correction and detection technique like CRC, checksum and parity

Contents: Lab manual based upon the theory course CS 14.306 and to achieve the listed course objectives and outcomes

Outcome(s): On successful completion of this course, students will be able

- To know how communication works at different layers of TCP/IP model
- To understand practically the purpose of various key protocol.
- To learn how a network can be efficiently deployed.
- To identify and analyze the latest technology with existing one.
- To configure network with client/server programming
- To understand computer network component and devices.

CS-14.374 **Comprehensive-II** **Credit: 0-0-0-4**

Prerequisite(s): CS-14.220 (Comprehensive-I), CS-14.301 (Design and Analysis of Algorithms), CS-14.303 (Operating System), CS-14.305 (Logic in Computer Science), CS-14.309 (Microprocessor and Assembly Language Programming), CS-14.332 (Software Engineering), CS-14.334 (Compiler Design), CS-14.336 (Computer Networks)

Objective(s):

- To examine the understanding of the student in different fields of computer science in concise manner.

1. **Design and Analysis of Algorithms:** Sorting, divide and conquer, graph theory, greedy algorithms, dynamic programming, backtracking, NP complete.
2. **Operating System:** Batch processing, multiprogramming, multiprocessing, and multitasking, process management, CPU scheduling, I/O scheduling, resource scheduling, deadlock and scheduling algorithms. Banker's algorithm for deadlock handling, memory management: virtual memory, paging, segmentation, concurrent processing: mutual exclusion, critical regions lock and unlock, scheduling.
3. **Logic in Computer Science:** Propositional (Boolean) logic, predicate logic, well–formed–formulae (WFF), satisfiability and tautology.
4. **Microprocessor:** Introduction to microprocessor, microprocessor instruction set, architecture of microprocessor, register set, mapping of memory and I/O devices, addressing modes, counters and time delays.
5. **Software Engineering**: Information gathering, requirement and feasibility analysis, data flow diagrams, process specifications, input/output design, process life cycle, planning and managing the project, design, coding, testing, implementation, maintenance.
6. **Compiler Design:** Context free languages and push-down automata, recursively enumerable sets and Turing machines, undecidability, lexical analysis, syntax and semantic analysis, intermediate code generation, code generation and optimization.
7. **Computer Networks:**ISO/OSI stack, LAN technologies (Ethernet, token ring), flow and error control techniques, routing algorithms, congestion control, TCP/UDP and sockets, IPv4, application layer protocols (ICMP, DNS, SMTP, POP, FTP, HTTP), basic concepts of hubs, switches, gateways, and routers, network security, basic concepts of public key and private key cryptography, digital signature, firewalls.

Outcome(s):

- At the end of this course students will be able to comprehend her knowledge gained in the entire year.

RM 17.101 **ResearchMethodology** **2-0-0-2**

1. **Introduction:** Meaning of research, Objectives, Motivation for Research, Types of Research, Research Approaches,ResearchProcess,ValidityandReliabilityin Research. [2]

2.**ProblemFormulation:**Identification,Selection andFormulation ofa ResearchProblem, Criteria ofagoodResearchProblem,Reviewof Literature, Research Gaps. [4]

3.**Research Design:**ResearchFramework, Meaning &SignificanceofResearchDesigns,Featuresofa goodResearch Design, Types of Research Design. [4]

4.**Dataforresearch:**TypesofData,Sources of Data, Methods of CollectingData,DataPresentation Techniques.Methodsof DataAnalysis.[4]

5. **Data Analysis and Simulation Tool:**Introduction to SPSS, MATLAB, Network Simulators, ETAP, Solid Works, MultiSim. [8]

6. **ReportWriting:**Types of Reports,Contents, Style Manuals, Results & Findings, Contributions, Implications, Scope for future work and conclusion, Referencing Styles, Anti Plagiarism Policy. [4]

TextBooks:

1. R.Pannershelvam, "ResearchMethodology" PrenticeHall India, New Delhi, 2nd Edition, 2013.
2. C.R.Kothari,"ResearchMethodology: MethodsandTechniques",New Age International (p) Limited,Publishers New Delhi, 4ndedition,2018.

CS 14.401 **Soft Computing** **Total Lectures: 40**
Credit: 3-0-0-3

Prerequisite(s): CS 14.305(Logic in Computer Science)

Objective(s):
- To familiarize with soft computing concepts
- To introduce the idea of neural networks, fuzzy logic and use of heuristics based on human experience
- To introduce the concept of genetic algorithm and its applications to soft computing using some applications

7. **Introduction**: Introduction of soft computing, types of soft computing, applications of soft computing, introduction of artificial intelligence, production system, various search techniques, hill climbing, best first search, knowledge representation, monotonic and non-monotonic reasoning. [8]
8. **Neural Networks:**Structure and function of a single neuron, definition of ANN, characteristics of ANN, applications of ANN, single layer networks, perceptron training algorithm, linear separability, various learning rules, delta rule, ADALINE, MEDALINE, multi-layer networks, activation functions, error back propagation algorithms, characteristics of EBPA. [8]
9. **Neral Network Architectures**: Counter propagation networks, architecture, functioning, characteristics, Hopfield network, configuration, associative memory, limitations and applications, Hopfield vs Boltzman machine, adaptive resonance theory, architecture, classification, implementation and training [8]
10. **Fuzzy Logic :**Fuzzy logic, fuzzy set theory, fuzzy set vs crisp set, crisp relation and fuzzy relation, introduction and features of membership functions, fuzzy rule based system, fuzzy propositions, formation, decomposition and aggregation of fuzzy rules, fuzzy reasoning, fuzzy interference system, fuzzy decision making, applications of fuzzy logic. [8]
11. **Genetic Algorithms :**Genetic algorithm, fundamentals, basic concepts, working principle, encoding, fitness function, reproduction, genetic modelling, inheritance operator, cross over, inversion and deletion, mutation operator, bitwise operator, generational cycle, convergence of GA, applications and advances in GA, difference and similarities between GA and other traditional methods. [8]

Outcome(s): On successful completion the students will be able to:
- Identify and describe soft computing techniques and their roles in building intelligent machines
- Apply fuzzy logic and reasoning to handle uncertainty and solve engineering problems
- Apply genetic algorithms to combinatorial optimization problems
- Apply neural networks to pattern classification and regression problems
- Evaluate and compare solutions by various soft computing approaches for a given problem

Text Books:

1. S. N. Sivanandan and S.N. Deepa, "Principles of Soft Computing", Wiley India, 2007
2. J.S.R.Jang, C.T.Sun and E. Mizutani, "Neuro-Fuzzy and Soft Computing", PHI, 2004
3. Pravir K. Chawdhry, Rajkumar Roy, Raj K. Pant "Soft Computing in Engineering Design and Manufacturing"Springer, 2012.

Reference Books:

2. Timothy J.Ross, "Fuzzy Logic with Engineering Applications", McGraw-Hill, 3rdEdition, 2009.
3. Davis E. Goldberg, "Genetic Algorithms: Search, Optimization and Machine Learning", Pearson Education , 2006

CS 14.403 **Parallel Computing** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 14.208 (Computer Organization and Architecture)

Objective(s):

- To provide students with contemporary knowledge in parallel computing.
- To equip students with skills to design and analyze parallel applications.
- Describe the various design issues in a parallel computing System e.g. system performance and reliability, distributed file system etc.
- Describe and program the communication among processes at different hosts to facilitate parallel computing.

1. **Introduction**: scope and issues of parallel and distributed computing, taxonomy of parallel structures, control mechanism, address-space organization, interconnection connection networks: static and dynamic interconnection networks, evaluating static interconnection networks, embedding other networks (linear array, mesh, binary tree) into a hypercube, routing mechanisms for static interconnection networks: store and forward (SF) routing, cut - theory (CT) routing, cost-performance trade-off, architectural models for parallel algorithm design. [8]
2. **Basic Communication Operation**: Simple message transfer between two processors, one-to-all broadcast, all-to-all broadcast, reduction and prefix sums, one-to-all personalized communication, all-to-all personalized communication, circular shift. [7]
3. **Performance and Scalability of Parallel Systems**: Performance matrices for parallel systems: run time, speed up, efficiency and cost, the effect of granularity and data mapping on performance, scalability of parallel systems, ISO-efficiency metric of scalability. [7]
4. **Models of Distributed Computing**: Mini computer model, workstation pool model, client-server model, pool of processors model, hybrid model. [6]
5. **Inter Process Communication and Remote Procedure Calling**: Building blocks, client-server communication,group communication, case study: inter processor communication in Unix, design issues in remote procedure calling, implementation. [6]
6. **Parallel Computing Algorithms**: Various sorting and searching algorithms, performance metrics for parallel algorithm implementations. [6]

Outcome(s): At the end of this course, student will be able to accomplish following.

- Define terminology commonly used in parallel computing, such as efficiency and speedup.
- Describe different parallel architectures, inter-connect networks, programming models, and algorithms for common operations such as matrix-vector multiplication.
- Given a problem, develop an efficient parallel algorithm to solve it.
- Given a parallel algorithm, analyze its time complexity as a function of the problem size and number of processors.
- Given a parallel algorithm, an input to it, and the number of processors, show the steps performed by that algorithm on that input.

Text Books:

1. Vipin Kumar, Ananth Grama, Anshul Gupta and George Karypis, "Introduction to Parallel Computing", 2nd Ed, Pearson Education,2008.
2. George Coulouris, Jean Dollimore and Tim Kindberg," Distributed Systems Concepts and Design", 4th Ed., Pearson Education, 2009.

Reference Books:

1. S G Akl, "The Decision and Analysis of Parallel Algorithms", Prentice Hall, 1989.
2. Hwang, Kai, "Advanced Computer Architecture: Parallelism, Scalability, Programmability", 2nd Ed., McGraw Hill, 2011.
3. J Jaja, "An Introduction to Parallel Algorithms", Addison Wesley, 1992.
4. T G Lewis and H El Rewini, "Introduction to Parallel Computing", Prentice-Hall 1992.

CS-14.405 **Digital Image Processing** **Total Lectures: 40**
Credit: 3-0-0-3

Prerequisite(s): CS-14.101 (Programming Language), MA-14.201(Applied Mathematics)

Objective(s):

- To study the image fundamentals and mathematical transforms necessary for image processing.
- To study the image enhancement techniques
- To study image restoration procedures.
- To study the image compression procedures.
- To study the image segmentation and representation techniques
- To study the image representation in form of features and descriptors

1. **Digital Image Fundamentals:** Elements of digital image processing systems, elements of visual perception, brightness, contrast, hue, saturation, mach band effect, color image fundamentals - RGB, HSI models, image sampling, quantization, dither, two-dimensional mathematical preliminaries, 2D transforms - DFT, DCT, KLT, SVD. [7]
2. **Image Enhancement and Restoration:** Histogram equalization and specification techniques, noise distributions, spatial averaging, directional smoothing, median, geometric mean, harmonic mean, contra harmonic mean filters, image restoration - degradation model, unconstrained restoration, inverse filtering, removal of blur caused by uniform linear motion. [7]
3. **Morphological Image Processing:** Basics, structuring element, erosion, dilation, opening, closing, hit-or-miss transform, boundary detection, hole filling, connected components, convex hull, thinning, thickening, skeletons, pruning, and reconstruction by dilation and erosion. [7]
4. **Image Segmentation:** Edge detection, edge linking via Hough transform, thresholding, region based segmentation, region growing, region splitting and merging, and segmentation by morphological watersheds, basic concepts, dam construction, and watershed segmentation algorithm. [7]
5. **Image Representation:** Boundary representation, chain code, polygonal approximation, signature, boundary segments, boundary description, shape number, Fourier descriptor, regional descriptors, and topological features. [6]
6. **Image Compression:**Need for data compression, Huffman, run length encoding, shift codes, arithmetic coding, vector quantization, transform coding, JPEG standard, MPEG. [6]

Outcome(s): On successful completion of this course, students will be able to

- Discuss digital image fundamentals.
- Apply image enhancement and restoration techniques.
- Use image compression and segmentation Techniques.
- Represent features of images.

Text Books:

3. Rafael C. Gonzales, Richard E. Woods, “Digital Image Processing”, Third Edition, Pearson Education, 2010.
4. Anil Jain K. “Fundamentals of Digital Image Processing”, PHI Learning Pvt. Ltd., 2011.
5. Bernd Jähne, Digital Image Processing, Springer Science & Business Media, 29-Jun-2013.

Reference Books:

6. Rafael C. Gonzalez, Richard E. Woods, Steven L. Eddins, “Digital Image Processing Using MATLAB”, Third Edition Tata Mc Graw Hill Pvt. Ltd., 2011.
7. William K Pratt, “Introduction to Digital Image Processing”, CRC Press, 13-Sep-2013.

CS 14.411 **Advanced Computer Architecture** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 14.101 (Programming languages), CS 14.208 (Computer Organization and Architecture)

Objective(s):

- To discuss the organization of computer-based systems and how a range of choices are influenced by application.
- To understand the organization and operation of current generation computer systems including multiprocessor and multicore systems.
- To understand the principles of I/O in computer systems including viable mechanism for I/O and secondary storage organization.

1. **Introduction**: Overview of parallel processing and pipelining, study and comparison of uni-processors and parallel processors, architectural classification, applications of parallel processors, instruction level parallelism, performance matrices and measures, speedup. [6]
2. **Pipelining:**Principles and implementation of pipelining, classification of pipelining processors, pipeline architecture, general pipelining reservation table, design aspect of arithmetic and instructional pipeline, pipelining hazards and resolving techniques, advanced pipelining techniques, software pipelining, implementation issues. [8]
3. **Vector and Array Processors** : Vector and array processors, basic vector architecture, issues in vector processing, SIMD computer architecture, masking and data network mechanism, interconnection networks of SIMD, static vs dynamic networks, parallel algorithm for array processors, matrix multiplication, sorting, implementation issues. [10]
4. **Multiprocessor Architecture** : Multiprocessor architecture, loosely and tightly coupled multiprocessors, characteristics of multiprocessor, inter-processor communication network, memory contention and arbitration techniques, cache coherence, bus snooping, massively parallel processors, inter process communication and synchronization. [10]
5. **Parallel Algorithms:**Multithreading, synchronous and asynchronous message passing, shared memory, study of parallel programming concepts, parallel algorithm for multiprocessors, operating system for multiprocessors, message passing interfaces, parallel programming languages, Fortran 90, Occam, C-Linda, CCC. [6]

Outcome(s): On successful completion of this course, students will be able to

- Describe the operation of performance enhancements such as pipelines, dynamic scheduling, branch prediction, cache, and vector processors.
- Describe modern architectures such as RISC, super scalar, multiprocessor and multicore systems.
- Develop applications for high performance computing systems.

Text Books:

1. Kai Hwang, Naresh Jotwani, “Advanced Computer Architecture”, McGraw-Hill Education, 2011.
2. John L Hennessey, David A Patterson, “Computer Architecture – A Quantitative Approach”, Morgan Kaufmann, Elsevier Publishers, 5thedition, 2012.

Reference Books:

1. Kai Hwang, Zhi Wei Xu, “Scalable Parallel Computing”, McGraw Hill,1998.
2. Kai Hwang, Faye A Briggs, “Computer Architecture and Parallel Processing”, McGraw Hill, 1984.

CS 14.413 **Foundations and Applications of IoT** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 14.101 (Programming Language), CS 14.303 (Operating System), CS 14.306 (Computer Networks)

Objective(s):
- To introduce the vision and impact of IoT.
- To understand IoT Market perspective.
- To understand the challenges that must be overcome by IoT technology.

1. **M2M to IoT:** The vision-introduction, from M2M to IoT, M2M towards IoT-the global context, a use case example, differing characteristics. [5]

2. **M2M to IoT – A Market Perspective:** Introduction, some definitions, M2M value chains, IoT value chains, an emerging industrial structure for IoT, the international driven global value chain and global information monopolies, M2M toIoT-an architectural overview, building an architecture, main design principles and needed capabilities, an IoT architecture outline, standards considerations. [9]

3. **M2M and IoT Technology Fundamentals:** Devices and gateways, local and wide area networking, data management, business processes in IoT, everything as a service (XaaS), M2M and IoT analytics, knowledge management. [7]

4. **IoT Architecture- Introduction, State of the art:** Architecture reference model-introduction, reference model and architecture, IoT reference model. [6]

5. **IoT Reference Architecture:**IoT reference architecture- introduction, functional view, information view, deployment and operational view, other relevant architectural views, real-world design constraints- introduction, technical design constraints-hardware is popular again, data representation and visualization, interaction and remote control. [8]

6. **Implementation Examples:** Industrial automation, the smart grid, smart cities. [5]

Outcome(s): On successful completion of this course, students will be able to
- Understand the vision of IoT from a global context.
- Determine the Market perspective of IoT.
- Understand the use of Devices, Gateways and Data Management in IoT.
- Build architecture in IoT
- Analyze, design and develop parts of IoT solution

Text Books:

1. Jan Holler, VlasiosTsiatsis, Catherine Mulligan, Stefan Avesand, Stamatis Karnouskos, David Boyle, “From Machine-to-Machine to the Internet of Things: Introduction to a New Age of Intelligence”, 1st Edition, Academic Press, 2014.
2. Malcolm Frank, Paul Roehrig, Ben Pring,"What To Do When Machines Do Everything" ,John Wiley & Sons, 13-Feb-2017

2. Peter Waher, "Learning Internet of Things", Packt Publishing Ltd, 27-Jan-2015.
3. Francis daCosta, “Rethinking the Internet of Things: A Scalable Approach to Connecting Everything”, 1st Edition, Apress Publications, 2013

CS 14.415 **Data Science and Big Data Analytics** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 14.204 (Database Management System)

Objective(s): To understand the fundamental concept of Data Science and Big Data Analytics and its application in various fields.

1. **Data and its Classifications**: Data, information, knowledge and wisdom, digital and analog data, unstructured data,semi-structured data ,structured data, sources of data, dealing with unstructured data, data science and responsibilities of data scientist, database, data warehouse, data mining and big data. [10]
2. **Introduction to Big Data**: Big data, characteristics of big data-volume, velocity, variety,challenges with big data, applications of big data in healthcare, agriculture, education, scientific experiments, advertising, stock market etc., integrity and privacy of big data, big data and cloud computing, big data and IoT. [10]
3. **Classification of Analytics:** Descriptive, diagnostic, discovery, prescriptive and predictive analytics, big data analytics, semantic analytics, in-memory analytics, analytics and decision making, shared nothing architecture, CAP theorem, parallel and distributed system, massively parallel processing. [10]
4. **Hadoop and its Architecture**: RDBMS and Hadoop, master slave architecture, HDFS, name node, secondary name node, data node, HDFS client, replica placement strategy, MapReduce, job tracker, task tracker, map phase, reduce phase, shuffle phase, Hadoop 1.0 and Hadoop 2.0, YARN, Installation of Hadoop in pseudo distributed mode and full distributed mode. [10]

Outcome(s): On successful completion of this course, students will be able to

- Apply learning and knowledge ofData Science and Big Data Analytics to solve real life problems in various areas of social importance.

Text Books:

2. Tom White, “Hadoop: The Definitive Guide”, O’Reilly Media,2012,ISBN: 978-1-449-38973-4
3. Vincenzo Morabito, "Big Data and Analytics: Strategic and Organizational Impacts",Springer,2015

Reference Books:

1. Rick Smolan, Jennifer Erwitt,“The Human Face of Big Data”, Sterling, 2012, ISBN:9781454908272
2. EMC Education Services , “Data Science and Big Data Analytics: Discovering, Analyzing, Visualizing and Presenting Data”, John Wiley & Sons, 05-Jan-2015, ,ISBN: 978-1-118-87613-8

ET 463 **Enterprise Computing – I** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS14.101 (Programming Language), CS 14.204 (Database Management System)

Objective(s):

- To define enterprise computing
- To provide an in-depth and comprehensive knowledge of the hardware and software architecture of enterprise system
- To introduce about the enterprise standards

1. **Characteristics of Enterprise Computing:** Reliability, availability, scalability, capacity, access to large amount of data, integrity and security, system management, autonomic capabilities. [5]
2. **Introduction to TSO & ISPF:** Logging in a mainframe, understanding ISPF menus, understanding datasets & record length, sequential, partitioned VSAM, creation of a PDS for programs, JCL etc. vs Loadlib, creation of a sequential DS for application data, understanding catalog, using ISPF editor. [10]
3. **JCL & SDSF Basics:** Basic JCL programming, modifying an existing compile, link and execute JCL for specific use, JOBCARD, DD statements, understanding JOB-STEP, understanding JOBLIB and STEPLIB, understanding PARM to move data from JCL to program, understanding SDSF outputs. [10]
4. **Basic Application Programming:** Understanding logical file name (used in program) and physical file name (used in JCL) and how they are mapped, writing a simple COBOL program with data stored in a VSAM file or a flat file (intent is not to teach COBOL language, the student should be able to apply the language in the environment, student will be provided with sample JCLs & VSAM file that will be used in program). [10]
5. **Introduction to SPUFI:** Understanding how to use SPUFI environment to write and execute SQL statements. [5]

Outcome(s): On successful completion of this course, students will be able to

- Describe the hardware and software architecture of an actual enterprise platform and explain the main functionality of the physical and virtual components.
- Perform basic administrative tasks in an enterprise computer system such as: the creation of new users, job monitoring and management, and back-ups and re- store operations.
- Possess basic practical knowledge regarding the process of installing, configuring and operating applications in an enterprise computer system as well as applying updates to the operating system

Text Book:

1. Alex Leon , IBM Mainframe Handbook, 1/e PB 1st Edition.
2. Alan Simon, “Network Re-engineering: Foundations of Enterprise Computing”, Academic Press, 2012.
3. Mike Ebbers, John Kettner, Wayne O'Brien, Bill Ogden, IBM Redbooks, “Introduction to the New Mainframe: z/OS Basics”, IBM Redbooks, 2012.

ET-362 **Mobile Apps Development** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): CS 14.202(Java Programming)

Objective(s):

- To learn how mobile apps are different from others traditional apps by learning those aspects of mobile programming that make it unique from other platforms
- Program mobile applications for the Android operating system that use basic and advanced phone features
- Deploy applications to the Android marketplace for distribution.

1. **Getting started with Mobility:** Mobility landscape, mobile platform, mobile apps development, overview of android platform, setting up the mobile app development environment along with an emulator, a case study on mobile app development. [8]
2. **Building blocks of mobile apps: Apps user:** Interface designing-mobile UI resources (Layout,UI elements, Draw-able,Menu), activity-states and life-cycle, interaction amongst activities. app-functionality beyond user interface- threads, async task, service –state and life cycle, notification, broad cast receivers, telephony and smsapis native data handling-on device file I/O, shared preferences, mobile database such as SQLite, and enterprise data access(via Internet/Intranet) [15]
3. **Sprucing up mobile apps:** Graphics and animation- custom views, canvas, animation APIs, multimedia-audio/video playback and record, location awareness, and native hardware access (sensor such as accelerometer and gyroscope). [8]
4. **Testing mobile apps:** Debugging mobile apps, whiteboxtesting,blackbox testing, and test automation of mobile app, JUnit for Android, Robotium, Monkey Talk. [6]
5. **Taking apps to market:** Versioning signing and packaging mobileapps, distributing apps on mobile market place. [3]

Outcome(s): On successful completion of this course, students will be able to

- Understand the android operating system in details
- Create mobile application for various screens
- Deploy on play store market
- Use various sensors available in mobile

Text Books:

1. Barry Burd, Android Application Development All in One for Dummies, Johen Wiley & Sons Inc., Edition I , 2011.

2. Anubhav Pradhan ,Anil V Deshpandy, Mobile App Development, Edition I

Reference Books: 1.Lauren Darcey, Shane Conder,"Teach Yourself Android Application Development in 24 Hours",Sams Publishing, 2012, 2nd Edition , 2012.

CS-14.451 **Soft Computing Laboratory** **Credit: 0-0-2-1**

Prerequisite(s): CS14.111(Programming Language Laboratory)

Objective(s):

- To implement heuristic search techniques.
- To implement neural networks for solving problems.
- To solve problems using fuzzy logic.
- To implement genetic algorithms.

Content: Lab manual based upon the theory course CS 14.401 and to achieve the listed course objectives and outcomes

Outcome(s): On successful completion of this course, the students will be able to

- Implement soft computing techniques for different problems.
- Develop soft computing models to handle non deterministic problems.
- Analyze and synthesize the performance of developed solution with relevant parameters.

CS-14.455 **Digital Image Processing Laboratory** **Credit: 0-0-2-1**

Prerequisite(s): CS14.111(Programming Language Laboratory)

Objective(s):

- To implement image transforms and analyze their performance.
- To implement image enhancement methods.
- To apply morphological operations on images.
- To implement image compression algorithms and analyze the efficiency.

Lab manual based upon the theory course CS 14.405 and to achieve the listed course objectives and outcomes

Outcome(s): On successful completion of this course, the students will be able to

- Apply basic operations on an image like read, write, binarizeetc.
- Apply image transforms and analyze their performance.
- Develop morphing algorithms as per the need.
- Extract features from image using segmentation.
- Compress a given image and analyze its performance.

CS-14.471 **Minor Project** **Credit: 0-0-0-5**

Prerequisite(s): CS14.111(Programming Language Laboratory)

Objective(s):

- To identify and formulate an engineering problem.
- To design a model or process to solve the formulated problem.
- To develop the solution by implementing the proposed design.
- To work in team to contribute to the development of project.
- To analyze and synthesize the product against critical and relevant parameters.

Content: Students will develop (preferably in a team) a project under guidance of faculty member based upon the area of interest of both student and faculty member.

Outcome(s): Preferably should cover most of the student outcomes.

CS-14.473 **Industrial Training Seminar** **Credit: 0-0-0-2**

Prerequisite(s): NIL

Objective(s):

- To observe and analyze the problem solving process/model on ground.
- To comprehend the acquired knowledge on field.
- To get some hands on practice on relevant technologies used in real life problem solving.
- To present the acquired knowledge to larger audience.

Content:

Students have to present the findings/observation while at training at some industry. They have to submit a report also clearly mentioning the outcomes of the training.

Outcome(s):

On successful completion of this course, the students will be able to

- Communicate effectively to arrange of audience.
- Recognize the need for continuous learning.
- Analyze and synthesize engineering problems and their solutions.

CS 14.402 **Distributed Systems** **Total Lectures: 40**

Credit: 3-0-0-3

Prerequisite(s): CS 14.202 (Java Programming), CS 14.303 (Operating Systems), CS 14.306 (Computer Networks)

Objective(s): To make students aware of:

- What a distributed system is, its example, use and utilities.
- Hardware and software requirements/constraints for implementation of distributed systems.
- Abstractions like, RMI, distributed objects, RPC, distributed shared memory etc.
- Notion of time in a distributed system.
- Databases in a distributed system.

1. **Characterization of Distributed Systems:** Definition, distributed systems-Internet, intranet, mobile, ubiquitous computing, resource sharing and World Wide Web challenges-heterogeneity, openness, security scalability failure handling concurrency and transparency. [3]
2. **System Models:** Architecture models- software layers, system architecture, variations on client-server model, interfaces, design requirement for distributed architectures, fundamental and interaction models, and failure and security models. [4]
3. **Distributed Object and Remote Invocation:** Introduction to remote method invocation (RMI) and interface in distributed systems, communication between distributed objects-objects model, distributed objects, distributed objects model and design issues for RMI, implementation of RMI and distributed garbage collection, remote procedures call and sun RPC case study, events and notifications participants, JINI distributed event specification, Java RMI case study, building client and server programs, design and implementation of Java RMI. [8]
4. **Time and Global State:** Clocks, events and process states, synchronizing physical clocks-synchronization in a synchronous system, Cristian method for synchronizing clocks, Berkley algorithm, network time protocol, global state and consistent cuts. [5]
5. **Distributed Shared Memory:** Introduction, message passing versus DSM, implementation approaches to DSM, design and implementation issues-structure and synchronization model. [5]
6. **Distributed Database Systems:** Distributed DBMS architecture, distributed database design, alternate design strategies, distribution design issues, fragmentation, and allocation. [5]
7. **Processes and Processors in Distributed Systems:** Threads, system models, processor allocation, scheduling, fault tolerance. [5]
8. **Distributed File System:** Design, implementation, trends in distributed file system. [5]

Outcome(s): On successful completion of the course the student will be able to:

- Understand the concept of distributed systems.
- Explain the principles underlying the functioning of distributed systems as well as how these principles are applied in distributed systems.
- Comprehend the problems and challenges of distributed systems.
- Understand and estimate the impact of different design choices, system features on distributed systems.

Text Books:

1. Colouris, “Distributed Systems Concepts and Design”, Addison Wesley, 5th edition, 2011.
2. George Coulouris, Jean Dollimore, Tim Kindberg, Gordon Blair,"Distributed Systems" , Pearson Education Limited, 2013

Reference Books:

1. Pradeep K. Sinha,"Distributed Operating Systems",PHI Learning Pvt. Limited, 2011.
2. MukeshSinghal, NiranjanShivrathri, “Advanced Concepts in Operating Systems”, TMH,

2011.

CS 14.412 **Software Project Management** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): CS 14.302 (Software Engineering)

Objective(s):

- To introduce the concepts of Software Project Management to the students.
- To make the students understand the requirement for project evaluation.
- To make the students understand the requirement for Software quality assurance and project management along with its tools.

1. **Introduction to Software Project Management (SPM) : S**oftware Engineering problem and software product, software product attributes, definition of a Software Project (SP), SP vs. other types of projects activities covered by SPM, categorizing SPs, Project Management cycle, SPM framework, types of project plan **[6]**
2. **Project Evaluation:** Strategic assessment, technical assessment, cost benefit analysis, cash flow forecasting, cost benefit evaluation techniques, risk evaluation **[5]**
3. **Activity Planning:** Objectives, project schedule, sequencing and scheduling activities, networkplanning models, forward pass, backward pass, activity float, shortening projectduration, activity on arrow networks, risk management, nature of risk, types ofrisk, managing risk, hazard identification, hazard analysis, risk planning and control **[8]**
4. **Monitoring and Control:** Introduction, creating the frame work, collecting the data, visualizing progress, cost monitoring, earned value, prioritizing monitoring, getting the project back to target, change control **[6]**
5. **Managing people and Organizing teams:**Introduction,understandingbehaviour, organizational behaviour: a background,selecting the right person for the job, instruction in the best methods, motivation, the Oldman, Hackman job characteristics model, working in groups, becominga team, decision making leadership, organizational structures, stress, health and safety, case studies **[8]**
6. **Software Quality Assurance and Testing:** Testing principles and objectives, test plan, types and levels of testing, test strategies, program verification and validation, software quality, SEI-CMM,SQA activities, QA organization structure, SQA plan **[7]**

Outcome(s):

Upon completion of the course the student should be able to:

- Examine the fundamentals of the software project and the factors involved in using a methodology in the context of project management.
- Explain the risks, issues, and critical success factors associated with technology projects and software projects in particular.
- Create a project plan, including scope definition, risk assessment, task breakdown, team selection, estimates, communication mechanisms and progress evaluation and reporting using an appropriate project lifecycle.
- Present and justify a fully documented project plan.
- Employ appropriate software for project planning, estimation, monitoring and control, communication and reporting.

Text Books:

1. Bob Hughes, Mikecotterell, “Software Project Management”, Fourth Edition, Tata McGraw Hill, 2009.

2. AshfaqueAhmed,"Software Project Management: A Process-Driven Approach",CRC Press, 2016.

Reference Books:

1. **Ramesh, Gopalaswamy, "Managing Global Projects", Tata McGraw Hill**,2nd ed. 2005.
2. Royce, “Software Project Management”, Pearson Education, 1999.
3. Walker Royce ,Software Project Management, , 1998, Addison Wesley.

CS 14.414 **Technologies of Big Data** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 14.415 (Data Science and Big Data and Analytics)

Objective(s): To understand and learn various technologies of Big Data Analytics and apply them to solve real world problems.

1. **Hadoop and MapReduce** :Functional programming , MapReduce programming, running a MapReduce programs on Hadoop, word count, distributed sort, distributed grep. [7]

2. **Hive**: Hive, HiveQL vs SQL, Hive in Hadoop ecosystem, installation of Hive, query execution in Hive, data types and file formats, create table, alter table, drop table, loading data into tables, select-from clause, where clause ,group by clause, join statements, views and indexes. [10]

3. **Pig**: Pig , PigLatin, Pig on Hadoop, installing and running Pig, Grunt, Pig data models, load, store and dump, relational operations-foreach, filter, groupby, orderby, distinct, Join, user defined functions(UDFs),developing and testing PigLatin scripts. [10]

4. **Spark** : Spark, Hadoop versus Spark, Installation of spark, spark architecture, solving business problem with Spark, Spark streaming framework and processing models. [7]

5. **NoSQL Databases** :NoSQL, database scaling, CAP theorem , ACID versus BASE, key – value stores, column oriented databases, document databases ,graph databases, NoSQL challenges. [6]

Outcome(s): On successful completion of this course, students would be able to

- Apply learning and knowledge of Big Data technologies tosolve real world problems and acquire required skills set for industry.

Text Books:

1. Chuck Lam, “Hadoop in Action”, Manning Publications,2nd ed. 2015, ISBN: 9781935182191
2. Edward Capriolo, Dean Wampler, Jason Rutherglen,“Programming Hive”, O’Reilly Media,2016,ISBN: 978-1-449-31933-5

Reference Books:

1. Alan Gates, “Programming Pig”, O’Reilly Media,2011,ISBN: 978-1-449-30264-1
2. James A. Scott, “Getting Started with Apache Spark”, MapR Technologies,2015

CS 14.416 **Designing of IoT** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 14.101 (Programming Languages), CS 14.303 (Operating System), CS 14.306 (Computer Networks)

Objective(s):
- To understand IoT architecture and IoT design constraints
- To understand the vision and impact of IoT
- Understand IoT Market perspective.

1. **Internet/Web and Networking Basics** : OSI Model, data transfer referred with OSI model, IP addressing, point to point data transfer, point to multi point data transfer & network topologies, sub-netting, network topologies referred with web, introduction to web servers, introduction to cloud computing [5]
2. **IoT Platform Overview:** Overview of IoT supported hardware platforms such as: raspberry pi, ARM cortex processors, arduino and intel galileo boards, network fundamentals: overview and working principle of wired networking equipment's – router, switches, overview and working principle of wireless networking equipment's – access points, hubs etc. linux network configuration concepts: networking configurations in linux accessing hardware & device files interactions. [7]
3. **IoT Architecture:** History of IoT, M2M – machine to machine, web of things, IoT protocols, remote monitoring & sensing, remote controlling, performance analysis, the layering concepts , IoT communication pattern, IoT protocol architecture, the 6LoWPAN, security aspects in IoT. [8]
4. **IoT Application Development**: MQTT, REST/HTTP, CoAP, MySQL, apache for handling HTTP Requests, PHP & MySQL for data processing, MongoDB object type database, HTML, CSS & jQuery for UI designing, JSON lib for data processing, security & privacy during development, application development for mobile platforms: overview of android / IOS app development tools. [13]
5. **Case Study & advanced IoT Applications:**IoT applications in home, infrastructures, buildings, security, Industries, home appliances, other IoT electronic equipments, use of big data and visualization in IoT, industry 4.0 concepts, sensors and sensor node and interfacing using any embedded target boards (Raspberry Pi / Intel Galileo/ARM Cortex/ Arduino) [7]

Outcome(s): On successful completion of this course, students will be able to:
- Explain the current status and expected future directions of the internet of things.
- Identify and propose applications which advance the IoT.
- Develop applications which advance the IoT.

Text Books:

1. Dr.OvidiuVermesan, Dr. Peter Friess, "Internet of Things: Converging Technologies for Smart Environments and Integrated Ecosystems", River Publishers,2013
2. Jean-Philippe Vasseur, Adam Dunkels, "Interconnecting Smart Objects with IP: The Next Internet", Morgan Kuffmann, 2010.
3. Zach Shelby, Carsten Bormann, "6LoWPAN: The Wireless Embedded Internet", Wiley, 2011.

Reference Books:

1. Asoke K Talukder and Roopa R Yavagal, "Mobile Computing", 4th ed. Tata McGraw Hill, 2010.
2. F. Adelstein and S.K.S. Gupta, "Fundamentals of Mobile and Pervasive Computing", McGraw Hill, 2009.

ET 474 **Enterprise Computing – II** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 463 (Enterprise Computing – I)

Objective(s):
- To define advance JCL.
- To provide an in-depth and comprehensive knowledge of the hardware and software architecture of enterprise system.
- To introduce about the enterprise standards.

1. **Advanced JCL:** Coding a JCL, using PROCS (Catalog and In-Stream), using DFSORT, ICETOOL. [8]
2. **Advanced Datasets:** Understanding record length, allocation of SPACE, fixed and variable record length, VSAM, defining VSAM, understanding CI and CA, GDG, understanding usage of GDG, defining GDG. [12]
3. **Understanding CICS:** CICS fundamentals, understanding transactions, pseudo conversational programming, understanding CICS tables, coding BMS maps, compiling of a CICS program & NEWCOPY + CEMT entry for programs, writing simple CICS program to read key data (say StudentID) from user & display details obtained from a VSAM, CICS tables for VSAM/DB2 will be provided. [20]

Outcome(s): On successful completion of this course, students will be able to
- Describe the hardware and software architecture of an actual enterprise platform and explain the main functionality of the physical and virtual components.
- Perform basic administrative tasks in an enterprise computer system such as: the creation of new users, job monitoring and management, and back-ups and re- store operations.
- Possess basic practical knowledge regarding the process of installing, configuring and operating applications in an enterprise computer system as well as applying updates to the operating system

Text Book:

1. IBM Mainframe Handbook by Alex Leon.
4. Alan Simon, "Network Re-engineering: Foundations of Enterprise Computing", Academic Press, 2012.
2. Mike Ebbers, John Kettner, Wayne O'Brien, Bill Ogden, IBM Redbooks, "Introduction to the New Mainframe: z/OS Basics", IBM Redbooks, 2012.

CS 14.422 **Software Testing and Quality Assurance** **Total Lectures: 40**
Credit: 3-1-0 -4

Prerequisite(s): CS 14.302 (Software Engineering)

Objective(s):

- To explore the basics and goals of software testing
- To discuss various types of software testing and its techniques
- To list out various tools that can be used for automating the testing process
- To introduce various software quality standards for establishing quality environment
- To discuss various methods and evaluation procedures for improving the quality Models

1. **Basics of Software Testing**: Definition, test cases, insights from a Venn diagram, identifying test cases, error and fault taxonomies, levels of testing, examples: generalized pseudo-code, the triangle problem, the NextDate problem, the commission problem [6]
2. **Decision Table Based Testing:** Decision tables, test cases for triangle problem, test cases for Next Date problem, test cases for commission problem, data flow testing, use testing, slice based testing, guidelines and observation, traditional view of testing levels, alternative life-cycle models, separating integration and system testing, decomposition based, call graph based, path based integration, case study [10]
3. **System and Interaction Testing:** Threads, basic concepts of requirements specification, finding threads, structural strategies and functional strategies for thread testing, SATM test threads, system testing guidelines, interaction testing, a taxonomy of interactions, composition, and determinism, client-server testing, issues in object-oriented testing, inheritance and polymorphism, levels of object-oriented testing, GUI testing, dataflow testing for object-oriented software, examples and case study [10]
4. **Object-Oriented Integration Testing**: UML support for integration testing, MM paths for object-oriented software, GUI testing, unit testing, object-oriented system testing, UML based system testing, statechart based system testing [6]
5. **Quality Assurance:** Software quality, level of measurement, reliability and validity, Ishikawa's seven basic tools, cause and effect diagram, reliability models, quality and quality management metrics, software process maturity assessment [8]

Outcome(s): On successful completion the students will be able to:

- Compare and pick out the right type of software testing process for any given real world problem
- Carry out the software testing process in efficient way
- Automate the testing process by using several testing tools
- Establish a quality environment as specified in standards for developing quality software
- Analyze and improve the quality procedures based on the past experience

Text Books:

1. Paul C. Jorgensen, "Software Testing: A Craftsman's Approach", Auerbach Publications, 4th Edition, 2016.
2. Stephen H Khan, "Metrics and Models in Software Quality Engineering", Pearson, 2nd edition 2013.

Reference Books:

1. CemKaner, Rebecca L. Fiedler,"Foundations of Software Testing" , Context-Driven Press, 2013
2. Aditya P Mathur, " Foundations of Software Testing", Pearson, 2008.
3. Mauro Pezze, Michal Young,"Software Testing and Analysis – Process, Principles and Techniques", John Wiley & Sons, 2008.

CS 14.424 **Machine Learning with Big Data** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 14.322 (Data Mining)

Objective(s): To learn the fundamental concept of machine learning and apply the concept of recommendations, clustering and classifications on large scale data sets using mahout.

1. **Introduction**: learning problems, designing learning system, perspectives and issues, concept learning, version spaces and candidate elimination algorithm, inductive bias, decision tree learning, representation, heuristic space search [8]
2. **Data Mining, Machine Learning** : Data mining ,machine learning, statistical modeling, feature extraction, computational approaches to modeling, statistical limits on data mining, statistical limits on data mining, Bonferroni's principle, recommendation engines, clustering and classifications, mahout : Mahout, installation and setting up of Mahout, tackling large scale data with mahout and Hadoop [8]
3. **Recommendations:** Defining recommendation, Running a recommender engine, Evaluating a recommender, Evaluating precision and recall, evaluating the GroupLens data set, representing preference data, in-memory data models, coping without preference values, user-based recommendation, item-based recommendation, similarity metrics, slope-one recommender, distributing recommendation computations [8]
4. **Clustering**: Clustering basics, measuring the similarity of items, running a simple clustering example, distance measures, representing data, visualizing vectors, representing text documents as vectors, generating vectors from documents, clustering algorithms in Mahout, k-means clustering, different kinds of clustering problems, fuzzy k-means clustering, model-based clustering, evaluating and improving clustering quality, real-world applications of clustering [8]
5. **Classifications**:Introduction to classification, Mahout for classification, differences between classification, recommendation, and clustering, applications of classification, working of classification, training a classifier, extracting features to build a Mahout classifier, preprocessing raw data into classifiable data, converting classifiable data into vectors, evaluating and tuning a classifier, deploying a classifier [8]

Outcome(s): Students would be able to apply learning and knowledge of machine learning techniquesin the area of Big Data Analytics using Mahoutto solve real life problems.

Text Books:

2. AnandRajaraman, Jure Leskovec, Jeffrey D. Ullman, "Mining of Massive Datasets", Cambridge University Press, 2015,ISBN:978-1-107-07723-2

CS 14.426 **Wireless and Sensor Networks** **Total Lectures: 40**
Credit: 3-1-0 -4

Prerequisite(s): CS 14.306 (Computer Networks)

Objective(s):

- To provide an overview about wireless and sensor networks and emerging technologies
- To study about the network architecture of sensor nodes and its execution environment
- To understand the concepts of communication, MAC and routing protocols in WSN
- To learn about topology control and clustering for localization services with sensor tasking and control
- To study about sensor node hardware and software platforms and understand the simulation and programming techniques

1. **Overview of Wireless Sensor Networks**: Introduction, characteristics, challenges for WSN, emerging technologies for WSN, advantages of sensor networks, applications. [8]
2. **Architecture:** Single-node architecture, hardware components, energy consumption of sensor nodes, operating system and execution environment, network architecture, single hop vs multi hop, multiple sources and sinks, optimization goals and figures of merit, WSN gateway and tunneling. [8]
3. **Networking Sensors:** Physical layer, MAC protocols for WSN, low duty cycle and wakeup concept S-MAC, address and name management, assignment of MAC addresses, routing protocols, multipath unicast routing, energy efficient routing, geographic routing. [8]
4. **Infrastructure**: Topology control, clustering, multilayer clustering, time synchronization, localization and positioning, positioning in multihop environment, ranging techniques, range based localization, sensor tasking and control, information based sensor tasking, joint routing and information aggregation [8]
5. **Platforms and Tools:** Sensor node hardware, Berkeley motes, programming challenges, node level software platforms, TinyOS, nesC, TinyGALS, simulators, ns2, TOSSIM, state centric programming [8]

Outcome(s): On successful completion the students will be able to:

- Compare and pick out the right type of software testing process for any given real world problem
- Carry out the software testing process in efficient way
- Automate the testing process by using several testing tools
- Establish a quality environment as specified in standards for developing quality software
- Analyze and improve the quality procedures based on the past experience

Text Books:

Reference Books:

1. KazemSohraby, Daniel Minoli, &TaiebZnati, “Wireless Sensor Networks- Technology, Protocols, And Applications”, John Wiley, 2007.
2. Anna Hac, “Wireless Sensor Network Designs”, John Wiley, 2003.

CS 14.418 **Software Defined Networking** **Total Lectures: 40**
Credit: 3-1-0 -4

Prerequisite(s): CS 14.302 (Software Engineering), CS 14.306 (Computer Networks)

Objective(s):

- To explore the basics of SDN
- To discuss various types plane
- To list out various controllers
- To program a simple SDN

1. **Control and Data Planes**: Introduction, evolution vs revolution, the control plane, data plane, moving information between planes, distributed control planes, convergence time, load balancing, creating the MPLS overlay, centralized control planes, logical vs literal, ATM.LANE, route servers. [8]
2. **SDN Controllers:** Wire protocol, replication, FAWG, hybrid approaches, SDN controllers, VMware, Nicira, OpenFlow, Mininet, NOX/POX, Trema, Ryu, L3VPN, RSPV-TE problem statement, bin-packing, deadlock, Plexxi, Cisco OnePK. [8]
3. **Network Programmability:** The management interface, the application-network divide, NETCONF and NETMOD, SNMP, modern programmatic interface, XMPP, JSON, I2RS, OpenStack, CloudStack, Puppet, virtual multitenant data center, SDN solution for data center networks. [8]
4. **Network Function Virtualization**: Virtualization and data plane I/O, services engineered path, service locations and chaining, NFV at ETSI, non-ETSI NFV work, network topology, LLDP, BGP-TE/LS, ALTO, I2RS topology. [8]
5. **Building an SDN framework:** Build code first, ask questions later, the Juniper SDN framework, IETF SDN framework, open daylight controller/framework, use cases for bandwidth scheduling, manipulation, data center overlays, big data, NFV, and traffic monitoring. [8]

Outcome(s): On successful completion the students will be able to:

- Describe the key benefits of SDN
- Describe the data plane
- Configure an SDN friendly network emulator
- Program a simple SDN for a given task using a low level approach and high level approach
- Evaluate a sample SDNs performance and reliability

CS-14.452 **Distributed Systems Laboratory** **Credit: 0-0-2-1**

Prerequisite(s): CS14.111(Programming Language Laboratory), CS 14.222(Java Programming Lab.)

Objective(s):

- To implement different abstractions of distributed systems.
- To understand the working principle of different theoretical abstractions like RMI, RPC, distributed shared memory etc.
- To understand the notion of logical clocks and event ordering in asynchronous distributed system through implementation

Content: Lab manual based upon the theory course CS 14.402 and to achieve the listed course objectives and outcomes

Outcome(s): On successful completion of this course, the students will be able to

- Analyze the working principles of different distributed system abstractions.
- Formulate programming models for DS concepts like RMI, RPC, distributed shared memory etc.
- Recognize event ordering in an asynchronous distributed system.

CS-14.472 **Major Project** **Credit: 0-0-0-10**

Prerequisite(s): CS14.111(Programming Language Laboratory)

Objective(s):

- To identify and formulate an engineering problem.
- To design a model or process to solve the formulated problem.
- To develop the solution by implementing the proposed design.
- To work in team to contribute to the development of project.
- To analyze and synthesize the product against critical and relevant parameters.

Content: Students will develop (preferably in a team) a project under guidance of faculty member based upon the area of interest of both student and faculty member.

Outcome(s): Preferably should cover most of the student outcomes.

CS-14.474 **Technical Seminar** **Credit: 0-0-0-1**

Prerequisite(s): NIL

Objective(s):

- To observe and analyze some latest technology.
- To comprehend the acquired knowledge.
- To present the acquired knowledge to larger audience.

Content:

Students have to comprehend and present on some latest development in the field of computing. They have to submit a report also clearly mentioning the significance and limitations of the technology and its social impact.

Outcome(s):

On successful completion of this course, the students will be able to

- Communicate effectively to arrange of audience.
- Recognize the need for continuous learning.
- Recognize the social impact of engineering solutions.

CS-14.301 **Design and Analysis of Algorithms** **Total Lectures: 40**
Credit:3-1-0-4

Prerequisite(s): CS-14.201(Discrete Structures), CS-14.203(Data Structures)

Objective(s):

- To learn the algorithm analysis techniques.
- To become familiar with the different algorithm design techniques.
- To understand the limitations of the algorithms power.

1. **Introduction:** Fundamentals of algorithms and problem solving, asymptotic notations, time complexity and analysis of algorithms, solutions of recurrence relations, master theorem and summations techniques. [8]
2. **Analysis of Sorting and Searching Algorithms:** Linear, binary and interpolation search, insertion, selection, merge, quick and heap sort, stability and other issues, hashing. [8]
3. **Algorithm Design Approaches:** Greedy method (knapsack problem, job sequencing problem), dynamic programming (assembly line scheduling, matrix chain multiplication), backtracking (8 queens problem, sum of subsets), branch and bound (0/1 knapsack problem), divide and conquer algorithms (Strassen matrix multiplication), problems based on these design paradigms. [8]
4. **Tree and Graph algorithms:** Spanning trees, Prim and Kruskal's algorithm, Huffman coding, BFS and DFS, disjoint set operations, connected components, shortest path algorithms in a graph such as Dijkstra, Bellman Ford, Warshall's etc. [8]
5. **Complexity Classes:** P,NP,NP hard and NP complete problems, reducibility, decision and optimization problems, examples of NP complete problems such as 3 CNF, clique, vertex cover and traveling salesman problem, basic introduction of approximation algorithms. [8]

Outcome(s): On the successful completion of the course, the student will be able to:

- Design algorithms for various computing problems.
- Analyze the time and space complexity of algorithms.
- Critically analyze the different algorithm design techniques for a given problem.
- Modify existing algorithms to improve efficiency.

Text Books:

5. Thomas H.Cormen, Charles E.Leiserson, Ronald L. Rivest and Clifford Stein, Introduction to Algorithms, PHI Learning Private Limited, 3rd edition, 2016.

8. Alfred V. Aho, John E. Hopcroft and Jeffrey D. Ullman, Data Structures and Algorithms, Pearson Education, 1st edition, 2006.
9. Donald E. Knuth, The Art of Computer Programming, Volumes 1& 3, Pearson Education, 2009.
10. Steven S. Skiena, The Algorithm Design Manual, Springer, 2nd edition, 2008.

CS-14.303 **Operating System** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS-14.207 (Computer Information System)

Objective(s):

- Understand the fundamental operating system abstractions like processes, threads, files, semaphores, IPC and deadlocks.
- Understand operating system from user's perspective as well as from system's perspective.
- Understand the principles of concurrency and synchronization.
- Understand basic resource management techniques.
- Understand different theoretical principles in depth through hands on high level programming.

7. **Overview:** Definition, types of operating systems: mainframe, server, multiprocessor, personal computer, real-time, embedded and smart card, system calls and utilities, batch, multiprogramming and multitasking operating system. [3]
8. **File Systems:** File concept, user and system programmer view of file systems, different modules of a file system, disk structure, disk-space allocation methods: contiguous, linked, indexed directory structures, file protection, disk scheduling algorithms. [6]
9. **Process Management:** Process concepts, threads, scheduling concepts, types of schedulers, scheduling algorithms, process state diagram, comparison of various CPU scheduling algorithms, multi-level queue scheduling. [6]
10. **Memory Management:** Logical and physical address spaces, base, limit and relocation registers, address binding, dynamic loading and linking, partitioning, swapping, contiguous memory allocation, non-contiguous memory allocation: segmentation, paging and segmentation. [8]
11. **Process Synchronization and deadlock:** Independent and concurrent processes, shared memory approach and message passing approach, mutual exclusion, synchronization, inter process communication, critical section problem and its solution to semaphores: binary and counting semaphores, wait/signal operations and their implementation, classical problems of synchronization, deadlock. [11]
12. **Case Studies:** Windows, UNIX and Linux: scheduling and memory management. [6]

Outcome(s): On successful completion of this course, students will be able to

- Analyze the primary functionalities of operating system.
- Manage system resources efficiently as an operating system designer.
- Develop new operating systems as well as work on existing ones to develop them further.

Text Books:

2. Galvin, Silberschatz, Gagne, Operating System Concepts, Wiley India, 9th edition, 2015.

CS-14.305 **Logic in Computer Science** **Total Lectures: 40**
Credit: 3-0-0-3

Prerequisite(s): CS-14.201(Discrete Structures), CS-14.207(Computer Information Systems)

Objective(s):

- To introduce the main notions of mathematical logic: logical notations (syntax) and how to assign meaning to them (semantics).
- To study formal frameworks (in the sense of being rigorous as well as in the sense of manipulating "form") for constructing logical arguments (proof theory).
- To study some deductive systems for propositional and first-order logic.
- To introduce the concept of fuzzy logic.

6. **Introduction:** Role of logic in computer science, problem representation, review of the principle of mathematical induction, the principle of structural induction, review of Boolean algebra, language, models, interpretations, validity, proof, decision problems in logic, decidability. [6]
7. **Propositional Logic:** Syntax, semantics, logical and algebraic concepts, identities and normal forms, tautology checking, propositional satisfiability, propositional resolution and tableaux method. [10]
8. **First Order Predicate Logic:** Quantifiers, first order models, validity and satisfiability, forward and backward chaining, Skolmization, normal forms, unification, Horn formulas and programs, resolution and tableaux. [12]
9. **Binary Decision Diagrams:** Representing Boolean functions, algorithms for ordered reduced binary decision diagram (OBDD), geometric templates from spatial relations, image based rendering, symbolic model checking, relational Mu-calculus, coding CTL models and specification [8]
10. **Fuzzy Logic:** Classic sets, fuzzy sets and membership, fuzzy set operations, Cartesian product, operations and properties of crisp relationship, operations and properties of fuzzy relationship. [4]

Outcome(s): On successful completion of this course, the students will be able to

- Use propositional and first-order logic.
- Apply of logic in specifying properties.
- Develop proof by induction.
- Design binary decision diagrams.
- Identify the scope for fuzzy logic.

CS 14.309 **Microprocessor and Assembly Language Programming** **Total Lectures: 40**
Credit: 3-0-0 -3

Prerequisite(s): CS 14.207 (Computer Information System)

Objective(s):
- To study architecture and memory management of 8-bit and 16-bit microprocessor (8085 & 8086)
- To study assembly language programming and use it to solve various problems.

6. **Introduction:** Evolution of Microprocessor and its types, 8085 microprocessor architecture, buses, registers, flags, 8085 pin configuration & function. [6]
7. **8085 Instruction Set:** Addressing modes of 8085, 8085 instruction set, data transfer arithmetic, logical and branch instructions, 8085 interrupt structure, limitations of 8085 microprocessor. [8]
8. **Interfacing:** Memory mapped I/O, I/O mapped I/O, address decoding, interfacing of memory with 8085, interfacing of I/O with 8085. [8]
9. **Advance Microprocessors:** 8086 microprocessor architecture, 8086 pin configuration & function, addressing modes of 8086, instruction set of 8086, 8086 interrupts, study of advance processors of the family (8088, 80286, 80386, 80486 and Pentium). [10]
10. **Assembly Language Programming:** Introduction, assembler directives, looping, condition and jump, subroutines, procedures, macros, parameter passing. [8]

Outcome(s): On successful completion of this course, students will be able to:
- Draw block diagram of 8085/86 processor and know the pin function
- Know the instruction set and addressing modes
- Write the assembly language program for different problems and know the use of procedures and macros.
- Design interface of memory chips.

MT 201 **Engineering Economics** **Total Lectures: 24Credit: 2-0-0-2**

Prerequisite(s): NIL

Objective(s):

- To know about the basic concepts of Engineering Economics and its role in Indian economy.
- To understand about the elements of economics with application to the industrial sector and its impact on Economy.
- To discuss about the market demand analysis, production analysis and pricing mechanism for decision making.
- To find the role of consumer perception in market demand and its features and infrastructure development in India.
- To discuss about cost analysis and optimization techniques with multiple objectives.

6. **Introduction to Engineering Economics:**Origin, principles, engineering economics and design process, engineering for economic competitiveness, engineering economy and the engineer. [3]
7. **Elements of Economics:**Definition, demand and supply, income, equilibrium, utility. [3]
8. **Economics applied to Industries:**Market demand analysis, production analysis for decision Making, cost analysis, pricing techniques in regards of goods and services, break even analysis, interest, annuities and profits. [12]
9. **Replacement Analysis:**Capital recovery, depreciation methods for replacement studies. [2]
10. **Optimization Techniques:**Economics and optimization, price mechanism and optimal resource allocation, optimization under constraints, optimization under risk and uncertainty, [4]

Outcome(s): Students would

- Be able to perform and evaluate payback period and capitalized cost on one or more than one economic alternatives.
- Be able to carry out and evaluate the benefit/cost, break even analysis on one or more alternatives.
- Have the knowledge of fundamentals of Engineering Economics for the purpose of economic condition of the country.

Text Books:

3. **Salvetore Dominick, Managerial Economics, Prentice Hall of India,6th Edition, 2008.**
4. **Christopher Thomas, S Charles Maurice, Managerial Economics, Mc-Graw Hill,11th Edition, 2012.**

Reference Book:

CS 14.315 **Python Programming** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): Programming Language (CS 14.101)

Objective(s): Python is a general-purpose, versatile and popular programming language. It's great as a first language because it is concise and easy to read, and it is also a good language to have in any programmer's stack as it can be used for everything from web development to software development and scientific applications.

11. **Introduction**: The basic elements of python, python syntax, compiled vs interpreted languages, formal and natural languages, built in python types, python as a calculator, basic input, branching programs, control structures, strings, tuples, lists and input iteration. [6]
12. **Functions and Abstraction**: Functions and scoping flow of execution, specifications, recursion, global variables, modules, stack diagrams, files, system functions and parameters, input and output, making your own module. [7]
13. **Structured Types and Higher-Order Functions**: Mutability strings, tuples, lists and dictionaries, lists and mutability, functions as Objects. [5]
14. **Classes and Object-Oriented Programming and Data Structure**: Abstract data types and classes, inheritance, encapsulation and information hiding, simple algorithms and data structures, list, tuple, sequence, set, search algorithms, sorting algorithms, hash tables. [8]
15. **Testing and Debugging**: Exceptions and assertions, types of testing – black-box and glass-box, debugging, handling exceptions, assertions. [6]
16. **Advance Python:** Regular expressions – REs and Python, plotting using PyLab, networking and Multithreaded Programming – sockets, threads and processes, chat Application, security – encryption and decryption, classical cyphers, graphics and GUI programming – drawing using Turtle, Tkinter and Python, Other GUIs. [8]

Outcome(s): Upon completion of this course students will be

- Familiar with Python syntax.
- Able to use python to implement a given logic.

Text Books:

3. John V Guttag, Introduction to Computation and Programming using Python, Prentice Hall of India, 2nd Edition, 2013.
4. Swaroop C H. , A Byte of Python, URL: https://python.swaroopch.com

5. Richard L. Halterman,Learning to Program with python, 2011.
6. Allen Downey ,Think Python How to Think Like a Computer Scientist, Version 2.0.17, Green Tea Press Needham, Massachusetts,2012.

CS-14.317 **Advance Web Technology** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 14.207 (Computer Information System)

Objective(s):

- To learn the platform neutral fundamentals of secure, dynamic web application development.
- To learn how to implement a web application using one specific set of open source server side tools: PHP and MySQL.

5. **Introduction:**HTTPprotocol:request and response, web browser and web servers, concepts of effective web design, web design issues including browser, bandwidth and cache, display resolution, look and feel of the website, page layout and linking, user centric design, sitemap, planning and publishing website, designing effective navigation. [4]

6. **JavaScript and XML:** Client side scripting with JavaScript, variables, functions, conditions, loops and repetition, pop up boxes, advance JavaScript: JavaScript and objects, JavaScript own objects, the DOM and web, browser environments, manipulation using DOM, forms and validations, Introduction to XML, uses of XML, simple XML, XML key components, DTD and Schemas, using XML with application, transforming XML using XSL and XSLT. [12]

7. **PHP:** Introduction and basic syntax of PHP, decision and looping with examples, PHP and HTML, arrays, functions, browser control and detection, string, form processing, files, advance features: Cookies and sessions, Object Oriented Programming with PHP. [12]

8. **PHP and MySQL:** Basic commands with PHP examples, connection to server, creating database, selecting a database, listing database, listing table names, creating a table, inserting data, altering tables, queries, deleting database, deleting data and tables, PhpMyadmin and database bugs. [12]

Outcome(s): Upon completion of the course students will be able to:

- Use the JavaScript to develop the dynamic web pages.
- Use server side scripting with PHP to generate the web pages dynamically using the database connectivity.
- Develop the modern Web applications using the client and server side technologies and the web design fundamentals.

Text Books:

3. Luke Welling, Laura Thomson: PHP and MySQL Web Development, Pearson, 2016.
4. Robin Nixon: Learning PHP, MySQL, and JavaScript, O'Reilly Media, 2012.

Reference Books:

6. W. Jason Gilmore: Beginning PHP and MySQL 5 From Novice to Professional, Apress, 2010.

CS- 14.319 **Advanced Java** **Total Lectures: 40Credit: 3-1-0-4**

Prerequisite(s): CS 14.202 (Java)

Objective(s): This course extends the study of Web Programming Fundamentals. Advanced concepts of program design, implementation and testing will be introduced with J2EE framework. Student will learn various concept of advance Java for implementation of small to medium sized application programs that illustrate professionally acceptable coding and performance standards.

1. **Introduction:** OOPS principle, class and objects, basics of HTML, web development introduction, web framework, J2EE building blocks, web application structure [3]
2. **Servlets:** Servlet needs, servlet request-response model, servlet life cycle (init, service, doGet, doPost), servlet configuration, scopes (session, request, page), servlet parameters, servlet context, forms processing (get, post), HTTP header processing, HTTP responses. [5]
3. **Java Server Pages**: JSP life cycle, JSP a servlets, creating dynamic content with use of JSP elements: expressions, scriptlets& declarations, JSP composition, redirecting, forwarding, accessing default objects (request, response, session, application, config, pageContext), error processing with use of JSP, Servlets vs. JSP pages [8]
4. **Session management**: Http session, the Http session interface session tracking: cookies, hidden fields, cookies and JSP, sending and receiving cookies. [4]
5. **Using Beans and tag libraries**: Separating presentation and business logic, JSP actions, JavaBeans, working with properties, <jsp:useBean>, <jsp:getProperty> and <jsp:setProperty>,using form parameters with Beans, custom tags, types of tags. [10]
6. **Web application:** Case study of a web application, the web.xml deployment descriptor, web.xml – document definition, web.xml – adding servlets, web.xml – mapping servlets, web.xml – sending parameters, web.xml – pre-loading servlets, web application archive, deployment of web application [10]

Outcome(s): Upon successful completion of this course you should be able to:

- Demonstrate knowledge of the advance Java along with object oriented development process and apply this understanding to the analysis and design of solutions for small to medium scale problems.
- Implement web application using all the feature of J2EE covered in the course.

Text Books:

3. By Martin Bond, Debbie Law, Andy Longshaw, Dan Haywood, Peter Roxburgh, Sams Teach Yourself J2EE in 21 Days, 2nd Edition,SAMS , 2004.
4. Phillip Hanna , Osborne, JSP 2.0: The Complete Reference, 2nd edition, McGraw-Hill,2003.

Reference Book:

2. Bryan Basham, Kathy Sierra & Bert Bets, Head First Servlets and JSP, 2nd Edition, , Oreilly publication, 2008.

CS-14.321 **Windows Programming** **Total Lectures:40 Credit : 3-1-0-4**

Prerequisite(s): CS-14.101(Programming Language)

Objective(s):

- To provide knowledge of windows programming using Visual Basic .NET.
- To focus on Visual Basic program structure, language syntax and implementation details.

7. **Overview of Windows Programming:** The Windows environment, history of Windows, aspects of Windows, Windows programming options, APIs and memory [4]

models, programming environment

8. **Visual Basic 2010:** The Visual Studio development environment, writing the code, building and deploying the application, working with Toolbox control,working with specific data types, working with operators, if…then structure, select case structure, the for…next loop, using counter variable, complex for…next loop, do loops, using timer object, processing errors by using try…catch statement, using finally clause, the exception object, using nested try…catch, the exit try statement. [12]
9. **Modules and Procedures:** Working with modules, creating public variables, creating procedures, writing sub procedure, passing arguments by value,working with array, using ReDim, the array class, working with object collections, for each…next loop, creating your own collection. [8]
10. **Designing User Interface:** Managing windows forms and controls at run time, adding graphics, the system drawing namespace, adding animation to your program, inheriting forms and creating base classes, working with printers. [6]
11. **Database:** Exploring text files, reading and writing text files, getting started with ADO.NET, SQL statements and LINQ, data presentation using DataGridView control. [6]
12. **Web Programming:** Creating websites and webpages using Visual Web Developer and ASP.NET, difference between webpages and web forms, server controls, HTML controls, using webpage designer, adding server controls to a webpage. [4]

Outcome(s): Upon completion of the course the student should be

- Able to analyze program requirements.
- Design/develop programs with GUI.
- Code program and develop interface using Visual Basic .NET.
- Perform tests, resolve defects and revise existing code.

Text Books:

1. Michael Halvorson, Microsoft Visual Basic 2010, Microsoft Press, 2010
2. Bradley and Millspaugh, Programming in Visual Basic 2010, Mcgraw-Hill, 2010

Reference Books:

1. Shelly Hoisington, Microsoft Visual Basic 2010 for Windows, Web, Office and Database Applications: Comprehensive, Cengage Learning, 2010.
2. Sheldon Bill et. al., Professional Visual Basic 2010 and .NET 4, John Wiley & Sons, 2010
3. Andrew Moore, Visual Studio 2010 All-in-one for Dummies, John Wiley & Sons, 2010

CS -14.323 **Shell Programming** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): Programming Language (CS 14.101)

Objective(s):
- To familiarize students with the Unix/Linux environment
- To learn the fundamentals of shell scripting/programming
- To familiarize students with basic Unix/Linux administration

6. **UNIX-Basic Concepts:** Introduction, file systems, visual editors, Unix philosophy and features, understanding the Unix commands and general purpose utilities and navigating the file system, the shell and kernel. [8]

7. **UNIX-Advanced Features:** File and directory structures, file systems and peripheral devices, handling ordinary files, file attributes. UNIX system administration, data blocks and i-nodes. [8]

8. **Unix Editors and Filters:** Vi Editor, simple filters, regular expression and grep family, advanced filters: sed and awk, awk pattern scanning and processing, awk arithmetic, operators and variables. [8]

9. **Shell Fundamentals:** Command syntax, Shell variables, pattern matching, escaping, command substitution, input /output redirection, pipes, tees, [6]

10. **Shell Scripting:** Bourne shell, C shell; scripts, meta characters and environment, shell programming and scripts, logical operators, control and looping statements and programs. Shell reliability, maintainability, efficiency, portability and usability. [10]

Outcome(s): After completion of the course students will be able to
- Work confidently in Unix/Linux environment
- Write shell scripts to automate various tasks
- Master the basics of Unix/Linux administration
- Understand the basic difference between high level programming and shell programming

Text Books:
3. Sumitabha Das, UNIX, Tata McGraw-Hill Companies, 4th edition, 2011.
4. **Cameron Newham, Learning the bash Shell:Unix Shell Programming, 3rdedition,O'Reilly Media,2009.**

Reference Books:
1. Bill Rosenblatt , Learning the Korn Shell, O'Reilly Media, 2002.
2. Mark G. Sobell ,A practical guide to Linux commands, editors, and shell programming, 2nded. Prentice Hall, 2013.

ET 465 **Agile Software Development** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS14.332 (Software Engineering)

Objective(s):

- To learn the fundamental principles and practices associated with each of the agile development methods.
- To learn how agile methods scale to large and distributed projects.
- To learn the essentials of collaboration as they apply to agile methods.
- To perform in-depth explorations into aspects of agile development that are particularly relevant to each student through detailed discussion sessions.

6. **Fundamentals of Agile:** The genesis of Agile, introduction and background, Agile manifesto and principles, overview of Scrum, extreme programming, feature driven development, lean software development, Agile project management, design and development practices in Agile projects, test driven development, continuous integration, refactoring, pair programming, simple design, user stories, Agile testing, Agile tools. [7]
7. **Agile Scrum Framework:** Introduction to Scrum, project phases, Agile estimation, planning game, product backlog, sprint backlog, iteration planning, user story definition, characteristics and content of user stories, acceptance tests and verifying stories, project velocity, burn down chart, sprint planning and retrospective, daily scrum, Scrum roles – product owner, Scrum master, Scrum team, Scrum case study, tools for Agile project management. [9]
8. **Agile Testing:** The Agile lifecycle and its impact on testing, test driven development (TDD), unit framework and tools for TDD, testing user stories – acceptance tests and scenarios, planning and managing testing cycle, exploratory testing, risk based testing, regression tests, test automation, tools to support the Agile tester, securing Agile software. [10]
9. **Agile Software Design and Development:** Agile design practices, role of design principles including single responsibility principle, open closed principle, Liskov substitution principle, interface segregation principles, dependency inversion principle, Agile design, need and significance of refactoring, refactoring techniques, continuous integration, automated build tools, version control. [10]
10. **Industry Trends:** Market scenario and adoption of Agile, Agile ALM, roles in an Agile project, Agile applicability, Agile in distributed teams, business benefits, challenges in Agile, risks and mitigation, Agile project on cloud, balancing Agility with discipline, Agile rapid development technologies. [4]

Outcome(s): On successful completion of this course, students will be able to

- Understand concept of agile software engineering and its advantages in software development. Recognize various agile methods.
- Design and manage a project using Scrum.
- Write user stories for project requirements.
- Write test cases for developing features.

Text Books:

4. Ken Schawber, Mike Beedle, Agile Software Development with Scrum, Pearson, 2008.
5. Robert C. Martin, Agile Software Development Principles, Patterns and Practices, Prentice Hall
6. Lisa Crispin, Janet Gregory, Agile Testing: A Practical Guide for Testers and Agile Teams, Addison Wesley.

Reference Books:

3. Alistair Cockburn, Agile Software Development: The Cooperative Game, Addition Wesley, 2006
4. Mike Cohn, User Stories Applied for Agile Software, Addison Wesley, 2004

CS-14.351 **DAA Laboratory** **Credit: 0-0-4-2**

Prerequisite(s): CS14.111(Programming Language Laboratory)

Objective(s):

- To analyze the asymptotic performance/Time complexity of algorithms.
- To demonstrate familiarity with major algorithms and data structures.
- To apply important algorithmic design paradigms, techniques and methods for the solution of real life problems.
- To synthesize efficient algorithms in common engineering design situations.

Contents: Lab manual based upon the theory course CS 14.301 and to achieve the listed course objectives and outcomes.

Outcome(s): On successful completion of this course, the students will be able to

- Evaluate and compare different algorithms using worst-, average-, and best-case analysis.
- Describe the divide-and-conquer paradigm and explain when an algorithmic design situation calls for it. Recite algorithms that employ this paradigm. Synthesize divide-and-conquer algorithms. Derive and solve recurrences describing the performance of divide-and-conquer algorithms.
- Describe the dynamic-programming paradigm and explain when an algorithmic design situation calls for it. Recite algorithms that employ this paradigm. Synthesize dynamic-programming algorithms, and analyze them.
- Describe the greedy paradigm and explain when an algorithmic design situation calls for it. Recite algorithms that employ this paradigm. Synthesize greedy algorithms, and analyze them.
- Explain the major graph algorithms and their analysis. Employ graphs to model engineering problems, when appropriate. Synthesize new graph algorithms and algorithms that employ graph computations as key components, and analyze them.
- Explain the different ways to analyze randomized algorithms (expected running time, probability of error). Recite algorithms that employ randomization. Explain the difference between a randomized algorithm and an algorithm with probabilistic inputs.
- Understand the difference between tractable and intractable problems, and to deal with them in approximation for finding the practical solutions.

CS-14.353 **Operating System Laboratory** **Credit: 0-0-2-1**

Prerequisite(s): CS14.111(Programming Language Lab.) CS 14.223(Data Structures Lab)

Objective(s):

- Learn basic operating system abstractions like process, file, page etc. through hands on programming.
- Comprehend problems of resource sharing in operating system and develop software solutions for the same.
- Work in groups to come out with solutions that require collective application of skills learnt.

Lab manual based upon the theory course CS 14.303 and to achieve the listed course objectives and outcomes.

Outcome(s): On successful completion of this course, the students will be able to

- Simulate different operating system scenarios like, process scheduling, memory management, disk scheduling, page replacement and deadlocks.
- Comprehend real life issues in operating system design and would design software level solutions for the same.
- Work in a group to come out with piecemeal solutions individually for a large problem in operating system and would be able enough to make handshaking between different modules to develop a single solution for the same.

CS 14.359 **Microprocessor and Assembly Language Programming Laboratory** **Credit: 0-0-2 -1**

Prerequisite(s): CS 14.227 (Computer Information Systems Laboratory)

Objective(s):

- To implement programs in assembly language
- To debug assembly language programs

Content: Lab manual based upon the theory course CS 14.309 and to achieve the listed course objectives and outcomes.

Outcome(s): On successful completion of this course, students will be able to:

- Solve basic arithmetic operations using the assembly language
- Write program to find smallest/largest number
- Use stack for solving various problems
- Use program counter, status register and show how these are used to execute machine code programs

CS-14.371 **Colloquium** **Credit: 0-0-0-1**

Prerequisite(s): NIL

Objective(s):

- To observe and analyze some popular technology and gain insights
- To comprehend the acquired knowledge.
- To present the acquired knowledge to larger audience.

Content: Students have to comprehend and present on some popular technology in the field of computing.

Outcome(s): On successful completion of this course, the students will be able to

- Communicate effectively to arrange of audience.
- Recognize the need for continuous learning.
- Recognize the social impact of engineering solutions.

CS-14.332 **Software Engineering** **Total Lectures:40**

Credit:3-0-0-3

Prerequisite(s): CS-14.101 (Programming Language), CS-14.203 (Data Structures)

Objective(s):

- To understand the basic software engineering approaches, software development process models, project planning, software size estimation, software effort and cost estimation and risk management.
- To know about software requirements specification, requirement elicitation, structured system analysis and introduction of object-oriented analysis and design, design techniques.
- To acquire knowledge on implementation issues such as modularity and coding standards.
- To learn coding style guidelines and standard and software testing, different type of testing strategies and their application in real time system.
- To study web based-system and application, software re-use, software re-engineering, agile software engineering, software engineering and testing tools.
- To develop teamwork and have project based experience.

6. **Introduction:** Programs versus software products, software crisis, need for software engineering, attributes of effective software, software myths, software characteristics, and role of management in software development, overview of quality standards like ISO 9001, SEI-CMM. [6]

7. **Software Processes and Requirement Analysis:** Software engineering: a layered technology, the software process, software process models, component based development, problem analysis, requirement engineering, requirement elicitation, requirement analysis, software requirement and specifications, data flow diagrams, data dictionaries, entity-relationship diagrams. [8]

8. **Software Project Planning:** Responsibilities & skills of a project manager, project planning, and project size estimation: LOC, function point & feature point metric, project estimation techniques, COCOMO model, staffing level estimation, scheduling, risk management, software configuration management. [9]

9. **Software Design:** The design process, design principles, design concepts, effective modular design: cohesion & coupling, classification of cohesiveness & coupling, design notations, design techniques, structure charts, introduction to object-oriented design. [8]

10. **Coding and Testing:** Software testing fundamentals, test case design, white box testing:-basis path testing, control structure testing, black box testing: boundary value analysis, equivalence class testing, decision table testing, cause effect graphing, level of testing, debugging, testing tools &standards, testing for client/server architecture, real time systems and GUIs testing. Brief of software re-use, reverse engineering, software re-engineering, agile software engineering. [9]

Outcome(s):

On successful completion of this course, students will be able to

- Demonstrate knowledge of the distinction between critical and non-critical systems and ability to manage a project including planning, scheduling and risk assessment/management.
- Author a software requirements document and understanding of the proper contents of a software requirements document.
- Demonstrate proficiency of different life cycle models.
- Identify specific components of a software design that can be targeted for reuse.
- Demonstrate proficiency in software development cost estimation, software testing plan and advanced topics of software engineering.

Text Books:

3. R. S. Pressman, Software Engineering – A practitioner's approach,Tata-McGraw- Hill Int. Ed., 8th edition, 2014.
4. K. K. Aggarwal, Yogesh Singh, Software Engineering, New Age International, 1st edition, 2008.

Reference Books:

4. Pankaj Jalote, An Integrated Approach to Software Engineering, Narosa Publisher, 3rdedition, 2005.
5. Rajib Mall, Fundamentals of Software Engineering, Prentice-Hall, 2ndedition, 2004.
6. Robert C. Martin, Agile Software Development, Principles, Patterns and Practices, 1st edition, 2002.

CS-14.336 **Computer Networks** **Total Lectures: 40**
Credit: 3-0-0-3

Prerequisite(s): CS-14.203 (Data Structures), CS-14.207 (Computer Information Systems)

Objective(s):

- To become familiar with layered communication architectures (OSI and TCP/IP).
- To understand the client/server model and key application layer protocols.
- To construct large-scale computer networks
- To understand fundamentals of computer networks and major protocols.
- To analysis and evaluate major Internet protocols.
- To program simple network applications using socket API
- To learn and adopt newly introduced computer network technologies by themselves.

9. **Introduction to Network Model:** History and development of computer networks, networks topologies, MANET, categories of networks, layering and protocols. [5]
10. **Physical Layer:** Different types of transmission media, transmission impairments, encoding schemes (NRZ, NRZI, Manchester, 4B/5B, Manchester etc.), packet and circuit switching. [5]
11. **MAC Layer:** Aloha, CSMA/CA, CSMA/CD protocols, performance evaluation and characteristics. [3]
12. **Data Link Layer:** Framing concept, error detection (parity, CRC), sliding window, stop and wait protocols, stop performance and efficiency. [5]
13. **Local Area Network:** IEEE 802.3, 802.4, 802.5, 802.11, performance evaluation. [5]
14. **Network Layer:** IPv4, IP address classes, classless addressing, IPv6, ARP, RARP, DHCP, ICMP, routing algorithms: distance vector, metrics, RIP, OSPF, BGP, congestion control algorithms, leaky bucket, token bucket. [8]
15. **Transport Layer:** Duties of the transport layer, connection, TCP, TCP services, TCP header, UDP, evaluating protocol such as TCP/UDP using simulator like NS2. [5]
16. **Application Layer:** DNS, FTP, HTTP, SMTP, POP, basics of network security (cryptography, digital signature and firewall). [4]

Outcome(s): On successful completion of this course, students will be able to

- Analyze computer network component and devices.
- Synthesize how communication works in a network and internet.
- Formulate the concept of topologies and their applications.
- Analyze protocol at different layers and how they play important role in network implementation.
- Identify and analyze the latest technology with existing one.
- Enumerate the layers of OSI and TCP/IP models.
- Configure network and wireless technology including client/server programming.

Text Books:

4. Hayes J. F., Modeling and Analysis of Computer Communication Networks, Plenum Press, 1st edition, 1987.

CS-14.316 **Computer Graphics** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS-14.101 (Programming Languages), MA-14.101 Mathematics I

Objective(s):

- To introduce the students with the graphics mode, with the help of basic algorithms and methodologies.
- The objective of the course is to equip students with fundamental knowledge and basic technical competence in the field of computer graphics.
- Provide an understanding of how a computer draws the fundamental graphics primitives.
- To learn Computer Graphics methodologies/Algorithms and techniques and their implementations.

1. **Introduction to Computer Graphics and graphics primitives**: Overview of interactive graphics model, applications of computer graphics, graphics devices, random and raster scan systems, color models: RGB, YIQ, scan conversion: point, line, circle and ellipse. [7]
2. **2D Transformation and Viewing**: Basic transformations (translation, rotation, scaling), homogeneous coordinates, composite transformations, reflection and shearing, filling: scan line filling, flood filling, boundary filling, clipping: point clipping, line clipping, polygon clipping, and character generation. [7]
3. **Curves and Surfaces**: Introduction to curves, conic curves, polygon surfaces, tables, quadric surfaces, spline representation, cubic spline interpolation methods, Bezier curves and surfaces, B-spline curves and surfaces, fractals and its applications. [7]
4. **3D Transformation and Viewing**: 3D transformation, composite transformation, viewing pipeline, parallel and perspective projection, visible surface detection: classification of visible surface detection algorithms, back face detection, depth buffer method, A-buffer method, scan-line method, depth sorting method. [7]
5. **Illumination Model and Surface Rendering Techniques**: Basic illumination models, Halftone patterns and dithering techniques, polygon rendering methods, ray tracing methods. [6]
6. **Introduction to Animation and Multimedia:** Introduction to animation, key-frame animation, construction of an animation sequence, animation techniques, multimedia: introduction, features of multimedia system, components of multimedia systems and application of multimedia systems. [6]

Outcome(s): On successful completion of this course, students will be able to

- Understand basic concepts of computer graphics.
- Acquire knowledge about drawing basic shapes such as lines, circle ellipse, polygon.
- Perform processing of basic shapes by various processing algorithms /techniques.
- Implement two and three dimensional transformations.
- Apply various algorithms of clipping.
- Acquire knowledge about illumination models, color models and surface rendering.

Text Books:

3. Donald D. Hearn & M. Pauline Baker, Computer Graphics-C Version, Pearson Education, 2nd edition, 2002.
4. James D. Foley, Andries van Dam, Steven K Feiner, John F. Hughes, Computer Graphics Principles and Practice, 2nd Edition in C, Addison Wesley, 1995.

Reference Books:

3. Donald Hearn and M Pauline Baker, Computer Graphics with OpenGL, Pearson Education, 4th edition, 2010.
4. David F. Rogers, Procedural Elements for Computer Graphics, Tata McGraw Hill Publications, 2nd edition, 2001.

CS-14.318 **Artificial Intelligence** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS-14.101 (Programming Language), CS-14.207(Computer Information Systems)

Objective(s):
- To understand the basic problem solving in Artificial Intelligence.
- To learn different blind as well as heuristic search strategies.
- To understand the various ways of knowledge representation in Artificial Intelligence.
- To know the concepts of game theory and natural language processing.

7. **Overview of Artificial Intelligence:** Introduction to artificial intelligence and intelligent agents, brief history of artificial intelligence, related research fields, AI techniques, AI problems, applications of AI, future of AI, basic concepts of LISP and PROLOG. [6]
8. **Problem Solving and Search Techniques:** Basics of problem solving, Problem representation paradigms, defining problem as a state space representation, uninformed search, depth first search, breadth first search, heuristic search, heuristic functions, generate and test, hill climbing, best first search, A* algorithm, problem reduction, AND/OR graph, AO* algorithm. [10]
9. **Knowledge Representation and Logic:** Representation and mappings, procedural versus declarative knowledge, approaches and issues in knowledge representation, introduction to logic-based problem solving, Boolean logic, first order logic, higher order logic, unification and resolution for performing logical inference, fuzzy logic, probabilistic logic. [8]
10. **Game Theory:** Minimax search, alpha-beta cutoffs, iterative deepening, references on specific games. [5]
11. **Natural Language Processing:** Introduction to NLP, syntactic processing, semantic analysis, discourse and pragmatic processing. [5]
12. **Learning:** Learning from observation, rote learning, inductive learning, explanation basedlearning, statistical learning methods, supervised and unsupervised learning, basics of neural network, reinforcement learning discovery, analogy. [6]

Outcome(s): On successful completion of this course, students will be able to
- Solve the basic problems and apply searching techniques used in Artificial Intelligence.
- To select knowledge representations to solve AI problems.
- Apply various game playing algorithms.
- Work with natural language processing and apply learning techniques.

Text Books:
3. Rich E., and Knight K., Artificial Intelligence, Tata McGraw-Hill, 3rd edition, 2009.
4. Russell S., and Norvig P., Artificial Intelligence – A Modern Approach, Prentice-Hall of India, 3rd edition, 2014.

Reference Books:
8. Patterson D. W., Introduction to Artificial Intelligence and Expert Systems, Prentice-Hall of India, 1st edition, 2015.
9. George F. Luger, Artificial Intelligence: Structures and Strategies for Complex Problem Solving, Pearson Education, 5th edition, 2009.

CS-14.320 **Cryptography** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS-14.201 (Discrete Structures), CS-14.207 (Computer Information Systems)

Objective(s):

- To understand the classical encryption and decryption algorithms, their techniques as well cryptanalysis.
- To acquire basic knowledge of finite fields and number theory.
- To understand the various block ciphers, stream cipher models, principles of public key cryptosystems, hash functions and digital signatures.
- To understand the different authentication techniques.

7. **General Overview and Classical Cryptography:** General overview of threats, risks and consequences, sources of threats, attacks, classification and preventive measures, introduction to some simple ciphers such as shift cipher, substitution cipher, affine cipher, Vigener cipher, hill cipher, permutation cipher and stream ciphers, rigorous cryptanalysis of all the above ciphers. [8]
8. **Symmetric/Secret Key Cryptography:** Block ciphers and their principles- boxes, P-boxes, DES, 3 DES, AES. [6]
9. **Elementary Number Theory:** Euclid's algorithm, extended Euclid's algorithm, groups, solving modular linear equations, Chinese remainder theorem, modular exponentiation, discrete logarithm problem, prime numbers and primality testing, factorization problem, Fermat's and Euler's theorem, computation of generators of primes. [8]
10. **Key Exchange/Distribution Schemes:** Diffie - Hellman key exchange, man- in- the-middle attack,Fiat-Naor key distribution, Needham – Schroeder scheme and attack possible on it, Kerberos. [6]
11. **Asymmetric Key/Public Key Cryptosystems:** RSA description, different attacks on RSA and remedies, other public keycryptosystems such as ElGamal and Rabin cryptosystems and possible attacks on them. [6]
12. **Digital Signature Schemes:**Security requirements for digital signatures, ElGamal digital signature scheme and its security analysis, the digital signature algorithm (DSA), Schnorr digital signature scheme, provably secure signature schemes and undeniable signatures. [6]

Outcome(s): On successful completion of this course, students will be able to :

- Analyze the security threats.
- Design robust cryptographic algorithms.

Text Books:

2. Douglas R. Stinson, Cryptography: Theory and Practice, (Discrete Mathematics and Its Applications) Chapman and Hall/CRC, 3rd edition, 2005.

Reference Books:

4. Jonathan Katz , Yehuda Lindell, Introduction to Modern Cryptography, (Cryptography and Network Security Series), Chapman and Hall/CRC; 2nd edition, 2014.
5. William Stallings, Cryptography and Network Security: Principles and Practice, Pearson Education, 6th edition 2013.
6. Wenbo Mao, Modern Cryptography Theory & Practice, 1st edition, 2004.

CS-14.322 **Data Mining** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS-14.204 (Database Management System), CS-14.301(Design and Analysis of Algorithms), MA-14.202 (Statistics and Probability Theory).

Objective(s):

- Understand the functionality of the various data mining and data warehousing components.
- Appreciate the strengths and limitations of various data mining and data warehousing models.
- Compare the various approaches to data warehousing and data mining implementations
- Describe and utilize a range of techniques for designing data warehousing and data mining systems for real-world applications.

8. **Overview:**Evolution of the database system technology, concept of data mining and warehousing, data warehouse roles and structures, cost of warehousing data, approaches to data exploration and data mining, foundations of data mining, web warehousing, introduction to knowledge management and knowledge bases. [5]
9. **Data Warehouse:**Overview of data warehousing, data marts, data warehouse architecture, multidimensional data model, online analytical processing (OLAP), OLAP operations, data about data - metadata. [4]
10. **Data Mining and Data Visualization:** Data mining general approach, classification and clustering, introduction to DM tool (Weka,Rapidminer), techniques used to mine the data, current limitations and challenges to DM, data visualization, visualization tools. [6]
11. **Data Preprocessing:** Overview, data cleaning, data integration, data reduction strategies, principal component analysis, sampling, histograms, clustering, data cube aggregation, data transformation and discretization. [6]
12. **Machine Learning:**Supervised and unsupervised machine learning, market basket analysis (Apriori algorithm), fuzzy logic and linguistic ambiguity, artificial neural networks, genetic algorithms,genetically evolved networks, applications for machine learning. [7]
13. **Text Mining:**Information retrieval and search, text classification, text clustering, unsupervised learning, mining frequent patterns and correlations, classification concepts, backpropagation, decision tree induction, rule based classification, clustering basic concepts and methods, K-means centroid based technique. [6]
14. **Web Based Statistical Analysis:** Delivering information over the web, query and reporting tools and business value, business value from analytical tools, statistical analysis applications, data discovery tools overview, data discovery applications, search engines and the web, search engine architecture, future of data mining. [6]

Outcome(s): On successful completion of this course, students will be able to

- Identify, formulate, and solve data science related problems by applying principles of the course.
- Understand both analysis and synthesis in the design process with the help of data mining and data warehousing tools.
- Develop and conduct appropriate experiments, analyze and interpret data, and use data visualization to draw conclusions.
- Function effectively on teams that establish goals, plan tasks,meet deadlines, and analyze risk and uncertainty.

Text Books:

4. George M Marakas, Modern Data Warehousing, Mining and Visualization, Pearson Education, 1st edition, 2002.
5. **Ian H. Witten and Eibe Frank, Data Mining: Practical Machine Learning Tools and Techniques, Morgan Kaufmann, 3rd edition, 2011.**
6. Mattison R., Web Warehousing and Knowledge Management, Tata McGraw-Hill, 1st edition, 1999.

Reference Books:

4. W.H. Inmon, BuildingtheData Warehouse, Wiley Publishing Inc., 3rdedition, 2005.
5. Anahory and Murray, Data Warehousing in the Real World, Pearson Education/Addison

Wesley, 1st edition, 1997.

6. Prabhu C.S.R., Data Warehousing, Prentice-Hall of India, 2nd edition, 2002.

CS-14.324 **Data Compression** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): MA-14.202 (Statistics and Probability Theory)

Objective(s):

- To develop theoretical foundations of data compression.
- To know the concepts and algorithms for lossy and lossless data compression.
- To understand signal modeling and its extension to compression with applications to speech, image and video processing.

5. **Introduction:** Compression techniques, measures of performance, modeling and coding, information theory, Shannon coding theory, physical models, probability models, Markov models, composite source model, fixed and variable length codes, uniquely decodable codes, prefix codes, Kraft's theorem. [10]

6. **Lossless Compression:** The Huffman coding algorithm: minimum variance Huffman codes, adaptive Huffman coding, Golomb codes, rice codes, Tunstall codes, coding a sequence, generating a binary code, comparison of binary and Huffman coding, diagram coding, dictionary based compression techniques, adaptive dictionary, LZ77, LZ78 and LZW approach, predictive coding, prediction with partial match, the Burrows-Wheeler transform, facsimile encoding, dynamic Markov compression. [10]

7. **Lossy Compression:** Distortion criteria, distortion measurement models, scalar quantization, uniform quantizer, adaptive quantization, non-uniform quantization, advantages of vector quantization over scalar quantization, the Linde-Buzo-Gray algorithm, tree structured vector quantizers, structured vector quantizers. [10]

8. **Multimedia Compression:** M-law and A-law commanding, DPCM and ADPCM audio compression, MPEG audio standard, frequency domain coding, lossless techniques of image compression, gray codes, transform coding, GIF**,** JPEG, predictive techniques, PCM and DPCM, video compression and MPEG industry standard, wavelet based compression. [10]

Outcome(s): On successful completion of this course, students will be able to

- Understand the concepts, applications and models of data compression.
- Apply the methods of lossy and lossless data compression.
- Apply the methods and standards of image, audio and video data compression.

Text Books:

2. **Khalid Sayood, Introduction to data compression, Morgan Kaufmann Publishers, 4th edition, 2012.**

Reference Books:

3. Mark Nelson and Jean-Loup Gailly: The Data Compression Book, M&T Books, 2nd edition, 1996.
4. David Salomon, Data Compression: The Complete Reference, Springer, 4th edition, 2006.

ET 471 **Cloud Computing (Infosys)** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s):
Objective(s):

1. **Overview of Cloud Computing:** Brief history and evolution - History of Cloud Computing, Evolution of Cloud Computing, Traditional vs. Cloud Computing. Why Cloud Computing, Cloud service models (IaaS, PaaS & SaaS). Cloud deployment models (Public, Private, Hybrid and Community Cloud), Benefits and Challenges of Cloud Computing. Introduction to AWS Public Cloud Vendor. Cost optimization in AWS. [10]

2. **Virtualization**: Basics of virtualization, Virtualization technologies, Server virtualization, VM migration techniques, Role of virtualization in Cloud Computing. Introduction to EC2 service of AWS. [8]

3. **Working with Private Cloud:** Private Cloud Definition, Characteristics of Private Cloud, Private Cloud deployment models, Private Cloud Vendors - CloudStack, OpenStack, Eucalyptus Microsoft, Private Cloud – Benefits and Challenges. Private Cloud implementation in Amazon EC2 service. [8]

4. **Working with Public Clouds:** What is Public Cloud, Why Public Cloud, When to opt for Public Cloud, Public Cloud Service Models, and Public Cloud Players. Infrastructure as a Service Offerings, IaaS Vendors, PaaS offerings, PaaS vendors, Software as a Service. Demonstrating public cloud with AWS – Storage and Database services. Private vs. Public Cloud – When to choose. [12]

5. **Overview of Cloud Security:** Explain the security concerns in Traditional IT, Introduce challenges in Cloud Computing in terms of Application Security, Server Security, and Network Security. Security reference model, Abuse and Nefarious Use of Cloud Computing, Insecure Interfaces and APIs, Malicious Insiders, Shared Technology Issues, Data Loss or Leakage, Account or Service Hijacking, Unknown Risk Profile, Shared security model between vendor and customer in IAAS/PAAS/SAAS, Implementingsecurity in AWS. [8]

6. **Future directions in Cloud Computing:** When and not to migrate to Cloud, Migration paths for cloud, Selection criteria for cloud deployment, Issues/risks in cloud computing, Future technology trends in Cloud Computing. [4]

Text Books:

1. Cloud Computing: Principles and paradigms By Raj Kumar Buyya, James Broberg, AndrezeiM.Goscinski, 2011
2. Cloud Computing, By Michael Miller, 2008.
3. Cloud Computing for dummies, By Judith Hurwitz, Robin Bllor, Marcia Kaufman, Fern Halper, 2009.
4. Cloud Computing: A Practical Approach, By Anthony T. Velte, Toby J. Velte, and Robert Elsenpeter, McGraw Hill, 2010.
5. Handbook of Cloud Computing, By BorkoFurht, Armando Escalante (Editors), Springer, 2010.

Reference Books:

1. Cloud computing: Implementation, management and security By Rittinghouse, John, W.
2. Cloud Computing Bible, By Barrie Sosinsky, Wiley, 2011.
3. Cloud Computing Architected: Solution Design Handbook by Rhoton, John.
4. Cloud Security, A comprehensive Guide to Secure Cloud Computing by Krutz, Ronald L.; Vines, Russell Dean

CS-14.352 **Software Engineering Laboratory** **Credit:0-0-2-1**

Prerequisite(s): CS-14.111 (Programming Language Lab),CS-14.223 (Data Structures Lab.) CS-14.351(DAA Lab), CS-14.224(Database Management Systems Lab.)

Objective(s):

- studying various phases of software development life cycle.
- Problem definition of any system (e.g. ATM system,health care, airlines, banking, insurance, retail, education or latest systems).
- Feasibility study of the system.
- Identifying the requirements from problem statements(IEEE Std:830-1993)
- Requirements, categorization of requirements, functional requirements, identifying functional requirements, non functional requirements.
- data flow diagram, graphical notations for data flow diagram, explanation of symbols used in DFD,context diagram and leveling DFD.
- Entity Relationship Model,entity set and relationship set , attributes of entity ,keys ,ER diagram ,graphical notations for ER ,estimation of projects, project metrics.
- Project estimation techniques ,COCOMO , Calculate effort using FP oriented estimation model , LOC based estimation for size oriented metrics
- Designing test suites, unit testing, integration testing, system testing, black box testing, and white box testing.
- Use some of the tools that are used in the different software development stages.

Contents:

Lab manual based upon the theory course CS 14.302 and to achieve the listed course objectives and outcomes.

Outcome(s): **On successful completion of this lab, students will be able to**

- Plan a software engineering process life cycle (SDLC Models) , including the specification, design, implementation, and testing of software systems that meet specification, performance,

maintenance and quality requirements

- Elicit, analyze and specify software requirements through a productive working relationship with various stakeholders of the project.
- Analyze and translate a specification into a design, and then realize that design practically, using an appropriate software engineering methodology and students are also able to calculate the approximate cost, time estimation of the project or system.
- Develop the code from the design and effectively apply relevant standards and perform testing, and quality management and practice, and students are also able to remove some errors, bugs, of the project or system.
- Use modern engineering tools necessary for software project management, time management.
- Apply software engineering principle for developing real life web and mobile applications.

CS-14.354 **Compiler Design Laboratory** **Credit: 0-0-2-1**

Prerequisite(s): CS 14.111(Programming Language Lab.) CS 14.223(Data Structures Lab.)

Objective(s):

- To design and implement a lexical analyzer
- To design and implement a parser
- To design and implement symbol tables
- To understand and design code generation schemes
- To learn the working of some compiler writing tools

Contents:

Lab manual based upon the theory course CS 14.304 and to achieve the listed course objectives and outcomes.

Outcome(s): On successful completion of this course, the students will be able to

- understand the peculiarities of a language translator
- get the practical approach of how a compiler works
- work in the development phase of new computer languages in industry
- understand the working of compiler construction tools
- visualize and design a new compiler of her own language

CS-14.356 **Computer Network Laboratory** **Credit: 0-0-2-1**

Prerequisite(s): CS14.111 (Programming Language Lab.), CS 14.223(Data Structures Lab.)

Objective(s):

- To implementing the client/server model with its application aspects.
- Sniffing packets in network as a network analyzer
- To implement protocols at various types communicating protocols
- To implement socket programming application with inbuilt API
- To code error correction and detection technique like CRC, checksum and parity

Contents: Lab manual based upon the theory course CS 14.306 and to achieve the listed course objectives and outcomes

Outcome(s): On successful completion of this course, students will be able

- To know how communication works at different layers of TCP/IP model
- To understand practically the purpose of various key protocol.
- To learn how a network can be efficiently deployed.
- To identify and analyze the latest technology with existing one.
- To configure network with client/server programming
- To understand computer network component and devices.

CS-14.374 **Comprehensive-II** **Credit: 0-0-0-4**

Prerequisite(s): CS-14.220 (Comprehensive-I), CS-14.301 (Design and Analysis of Algorithms), CS-14.303 (Operating System), CS-14.305 (Logic in Computer Science), CS-14.309 (Microprocessor and Assembly Language Programming), CS-14.332 (Software Engineering), CS-14.334 (Compiler Design), CS-14.336 (Computer Networks)

Objective(s):

- To examine the understanding of the student in different fields of computer science in concise manner.

8. **Design and Analysis of Algorithms:** Sorting, divide and conquer, graph theory, greedy algorithms, dynamic programming, backtracking, NP complete.
9. **Operating System:** Batch processing, multiprogramming, multiprocessing, and multitasking, process management, CPU scheduling, I/O scheduling, resource scheduling, deadlock and scheduling algorithms. Banker's algorithm for deadlock handling, memory management: virtual memory, paging, segmentation, concurrent processing: mutual exclusion, critical regions lock and unlock, scheduling.
10. **Logic in Computer Science:** Propositional (Boolean) logic, predicate logic, well–formed–formulae (WFF), satisfiability and tautology.
11. **Microprocessor:** Introduction to microprocessor, microprocessor instruction set, architecture of microprocessor, register set, mapping of memory and I/O devices, addressing modes, counters and time delays.
12. **Software Engineering**: Information gathering, requirement and feasibility analysis, data flow diagrams, process specifications, input/output design, process life cycle, planning and managing the project, design, coding, testing, implementation, maintenance.
13. **Compiler Design:** Context free languages and push-down automata, recursively enumerable sets and Turing machines, undecidability, lexical analysis, syntax and semantic analysis, intermediate code generation, code generation and optimization.
14. **Computer Networks:**ISO/OSI stack, LAN technologies (Ethernet, token ring), flow and error control techniques, routing algorithms, congestion control, TCP/UDP and sockets, IPv4, application layer protocols (ICMP, DNS, SMTP, POP, FTP, HTTP), basic concepts of hubs, switches, gateways, and routers, network security, basic concepts of public key and private key cryptography, digital signature, firewalls.

Outcome(s):

- At the end of this course students will be able to comprehend her knowledge gained in the entire year.

RM 17.101 **Research Methodology** **2-0-0-2**

1. **Introduction:** Meaning of research, Objectives, Motivation for Research, Types of Research, Research Approaches, Research Process,Validity and Reliabilityin Research. [2]

2.**ProblemFormulation:**Identification,Selection andFormulation ofa ResearchProblem, Criteria ofagood Research Problem, Reviewof Literature, Research Gaps. [4]

3.**Research Design:**ResearchFramework, Meaning &Significance of ResearchDesigns,Featuresofa good Research Design, Types of Research Design. [4]

4.**Dataforresearch:**TypesofData,Sources of Data, Methods of Collecting Data,DataPresentation Techniques. Methodsof DataAnalysis.[4]

5. **Data Analysis and Simulation Tool:** Introduction to SPSS, MATLAB, Network Simulators, ETAP, Solid Works, MultiSim. [8]

6. **ReportWriting:**Types of Reports,Contents, Style Manuals, Results & Findings, Contributions, Implications, Scope for future work and conclusion, Referencing Styles, Anti Plagiarism Policy. [4]

CS 14.401 **Soft Computing** **Total Lectures: 40**
Credit: 3-0-0-3

Prerequisite(s): CS 14.305(Logic in Computer Science)

Objective(s):
- To familiarize with soft computing concepts
- To introduce the idea of neural networks, fuzzy logic and use of heuristics based on human experience
- To introduce the concept of genetic algorithm and its applications to soft computing using some applications

13. **Introduction**: Introduction of soft computing, types of soft computing, applications of soft computing, introduction of artificial intelligence, production system, various search techniques, hill climbing, best first search, knowledge representation, monotonic and non-monotonic reasoning. [8]
14. **Neural Networks:**Structure and function of a single neuron, definition of ANN, characteristics of ANN, applications of ANN, single layer networks, perceptron training algorithm, linear separability, various learning rules, delta rule, ADALINE, MEDALINE, multi-layer networks, activation functions, error back propagation algorithms, characteristics of EBPA. [8]
15. **Neral Network Architectures**: Counter propagation networks, architecture, functioning, characteristics, Hopfield network, configuration, associative memory, limitations and applications, Hopfield vs Boltzman machine, adaptive resonance theory, architecture, classification, implementation and training [8]
16. **Fuzzy Logic :**Fuzzy logic, fuzzy set theory, fuzzy set vs crisp set, crisp relation and fuzzy relation, introduction and features of membership functions, fuzzy rule based system, fuzzy propositions, formation, decomposition and aggregation of fuzzy rules, fuzzy reasoning, fuzzy interference system, fuzzy decision making, applications of fuzzy logic. [8]
17. **Genetic Algorithms :**Genetic algorithm, fundamentals, basic concepts, working principle, encoding, fitness function, reproduction, genetic modelling, inheritance operator, cross over, inversion and deletion, mutation operator, bitwise operator, generational cycle, convergence of GA, applications and advances in GA, difference and similarities between GA and other traditional methods. [8]

Outcome(s): On successful completion the students will be able to:
- Identify and describe soft computing techniques and their roles in building intelligent machines
- Apply fuzzy logic and reasoning to handle uncertainty and solve engineering problems
- Apply genetic algorithms to combinatorial optimization problems
- Apply neural networks to pattern classification and regression problems
- Evaluate and compare solutions by various soft computing approaches for a given problem

6. Davis E. Goldberg, "Genetic Algorithms: Search, Optimization and Machine Learning", Pearson Education , 2006

CS 14.403 **Parallel Computing** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): CS 14.208 (Computer Organization and Architecture)

Objective(s):

- To provide students with contemporary knowledge in parallel computing.
- To equip students with skills to design and analyze parallel applications.
- Describe the various design issues in a parallel computing System e.g. system performance and reliability, distributed file system etc.
- Describe and program the communication among processes at different hosts to facilitate parallel computing.

1. **Introduction**: scope and issues of parallel and distributed computing, taxonomy of parallel structures, control mechanism, address-space organization, interconnection connection networks: static and dynamic interconnection networks, evaluating static interconnection networks, embedding other networks (linear array, mesh, binary tree) into a hypercube, routing mechanisms for static interconnection networks: store and forward (SF) routing, cut - theory (CT) routing, cost-performance trade-off, architectural models for parallel algorithm design. [8]
2. **Basic Communication Operation**: Simple message transfer between two processors, one-to-all broadcast, all-to-all broadcast, reduction and prefix sums, one-to-all personalized communication, all-to-all personalized communication, circular shift. [7]
3. **Performance and Scalability of Parallel Systems**: Performance matrices for parallel systems: run time, speed up, efficiency and cost, the effect of granularity and data mapping on performance, scalability of parallel systems, ISO-efficiency metric of scalability. [7]
4. **Models of Distributed Computing**: Mini computer model, workstation pool model, client-server model, pool of processors model, hybrid model. [6]
5. **Inter Process Communication and Remote Procedure Calling**: Building blocks, client-server communication,group communication, case study: inter processor communication in Unix, design issues in remote procedure calling, implementation. [6]
6. **Parallel Computing Algorithms**: Various sorting and searching algorithms, performance metrics for parallel algorithm implementations. [6]

Outcome(s): At the end of this course, student will be able to accomplish following.

- Define terminology commonly used in parallel computing, such as efficiency and speedup.
- Describe different parallel architectures, inter-connect networks, programming models, and algorithms for common operations such as matrix-vector multiplication.
- Given a problem, develop an efficient parallel algorithm to solve it.
- Given a parallel algorithm, analyze its time complexity as a function of the problem size and number of processors.
- Given a parallel algorithm, an input to it, and the number of processors, show the steps performed by that algorithm on that input.

5. S G Akl, "The Decision and Analysis of Parallel Algorithms", Prentice Hall, 1989.
6. Hwang, Kai, "Advanced Computer Architecture: Parallelism, Scalability, Programmability", 2nd Ed., McGraw Hill, 2011.
7. J Jaja, "An Introduction to Parallel Algorithms", Addison Wesley, 1992.
8. T G Lewis and H El Rewini, "Introduction to Parallel Computing", Prentice-Hall 1992.

CS-14.405 **Digital Image Processing** **Total Lectures: 40**
Credit: 3-0-0-3

Prerequisite(s): CS-14.101 (Programming Language), MA-14.201(Applied Mathematics)

Objective(s):

- To study the image fundamentals and mathematical transforms necessary for image processing.
- To study the image enhancement techniques
- To study image restoration procedures.
- To study the image compression procedures.
- To study the image segmentation and representation techniques
- To study the image representation in form of features and descriptors

7. **Digital Image Fundamentals:** Elements of digital image processing systems, elements of visual perception, brightness, contrast, hue, saturation, mach band effect, color image fundamentals - RGB, HSI models, image sampling, quantization, dither, two-dimensional mathematical preliminaries, 2D transforms - DFT, DCT, KLT, SVD. [7]
8. **Image Enhancement and Restoration:** Histogram equalization and specification techniques, noise distributions, spatial averaging, directional smoothing, median, geometric mean, harmonic mean, contra harmonic mean filters, image restoration - degradation model, unconstrained restoration, inverse filtering, removal of blur caused by uniform linear motion. [7]
9. **Morphological Image Processing:** Basics, structuring element, erosion, dilation, opening, closing, hit-or-miss transform, boundary detection, hole filling, connected components, convex hull, thinning, thickening, skeletons, pruning, and reconstruction by dilation and erosion. [7]
10. **Image Segmentation:** Edge detection, edge linking via Hough transform, thresholding, region based segmentation, region growing, region splitting and merging, and segmentation by morphological watersheds, basic concepts, dam construction, and watershed segmentation algorithm. [7]
11. **Image Representation:** Boundary representation, chain code, polygonal approximation, signature, boundary segments, boundary description, shape number, Fourier descriptor, regional descriptors, and topological features. [6]
12. **Image Compression:**Need for data compression, Huffman, run length encoding, shift codes, arithmetic coding, vector quantization, transform coding, JPEG standard, MPEG. [6]

Outcome(s): On successful completion of this course, students will be able to

- Discuss digital image fundamentals.
- Apply image enhancement and restoration techniques.
- Use image compression and segmentation Techniques.
- Represent features of images.

Text Books:

10. Rafael C. Gonzales, Richard E. Woods, “Digital Image Processing”, Third Edition, Pearson Education, 2010.
11. Anil Jain K. “Fundamentals of Digital Image Processing”, PHI Learning Pvt. Ltd., 2011.
12. Bernd Jähne, Digital Image Processing, Springer Science & Business Media, 29-Jun-2013.

CS 14.411 **Advanced Computer Architecture** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 14.101 (Programming languages), CS 14.208 (Computer Organization and Architecture)

Objective(s):

- To discuss the organization of computer-based systems and how a range of choices are influenced by application.
- To understand the organization and operation of current generation computer systems including multiprocessor and multicore systems.
- To understand the principles of I/O in computer systems including viable mechanism for I/O and secondary storage organization.

6. **Introduction**: Overview of parallel processing and pipelining, study and comparison of uni-processors and parallel processors, architectural classification, applications of parallel processors, instruction level parallelism, performance matrices and measures, speedup. [6]
7. **Pipelining:**Principles and implementation of pipelining, classification of pipelining processors, pipeline architecture, general pipelining reservation table, design aspect of arithmetic and instructional pipeline, pipelining hazards and resolving techniques, advanced pipelining techniques, software pipelining, implementation issues. [8]
8. **Vector and Array Processors** : Vector and array processors, basic vector architecture, issues in vector processing, SIMD computer architecture, masking and data network mechanism, interconnection networks of SIMD, static vs dynamic networks, parallel algorithm for array processors, matrix multiplication, sorting, implementation issues. [10]
9. **Multiprocessor Architecture** : Multiprocessor architecture, loosely and tightly coupled multiprocessors, characteristics of multiprocessor, inter-processor communication network, memory contention and arbitration techniques, cache coherence, bus snooping, massively parallel processors, inter process communication and synchronization. [10]
10. **Parallel Algorithms:**Multithreading, synchronous and asynchronous message passing, shared memory, study of parallel programming concepts, parallel algorithm for multiprocessors, operating system for multiprocessors, message passing interfaces, parallel programming languages, Fortran 90, Occam, C-Linda, CCC. [6]

Outcome(s): On successful completion of this course, students will be able to

- Describe the operation of performance enhancements such as pipelines, dynamic scheduling, branch prediction, cache, and vector processors.
- Describe modern architectures such as RISC, super scalar, multiprocessor and multicore systems.
- Develop applications for high performance computing systems.

Text Books:

3. Kai Hwang, Naresh Jotwani, “Advanced Computer Architecture”, McGraw-Hill Education, 2011.
4. John L Hennessey, David A Patterson, “Computer Architecture – A Quantitative Approach”, Morgan Kaufmann, Elsevier Publishers, 5thedition, 2012.

Reference Books:

3. Kai Hwang, Zhi Wei Xu, “Scalable Parallel Computing”, McGraw Hill,1998.
4. Kai Hwang, Faye A Briggs, “Computer Architecture and Parallel Processing”, McGraw Hill, 1984.

CS 14.413 **Foundations and Applications of IoT** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 14.101 (Programming Language), CS 14.303 (Operating System), CS 14.306 (Computer Networks)

Objective(s):
- To introduce the vision and impact of IoT.
- To understand IoT Market perspective.
- To understand the challenges that must be overcome by IoT technology.

7. **M2M to IoT:** The vision-introduction, from M2M to IoT, M2M towards IoT-the global context, a use case example, differing characteristics. [5]

8. **M2M to IoT – A Market Perspective:** Introduction, some definitions, M2M value chains, IoT value chains, an emerging industrial structure for IoT, the international driven global value chain and global information monopolies, M2M toIoT-an architectural overview, building an architecture, main design principles and needed capabilities, an IoT architecture outline, standards considerations. [9]

9. **M2M and IoT Technology Fundamentals:** Devices and gateways, local and wide area networking, data management, business processes in IoT, everything as a service (XaaS), M2M and IoT analytics, knowledge management. [7]

10. **IoT Architecture- Introduction, State of the art:** Architecture reference model-introduction, reference model and architecture, IoT reference model. [6]

11. **IoT Reference Architecture:**IoT reference architecture- introduction, functional view, information view, deployment and operational view, other relevant architectural views, real-world design constraints- introduction, technical design constraints-hardware is popular again, data representation and visualization, interaction and remote control. [8]

12. **Implementation Examples:** Industrial automation, the smart grid, smart cities. [5]

Outcome(s): On successful completion of this course, students will be able to
- Understand the vision of IoT from a global context.
- Determine the Market perspective of IoT.
- Understand the use of Devices, Gateways and Data Management in IoT.
- Build architecture in IoT
- Analyze, design and develop parts of IoT solution

Text Books:

6. Francis daCosta, “Rethinking the Internet of Things: A Scalable Approach to Connecting Everything”, 1st Edition, Apress Publications, 2013

CS 14.415 **Data Science and Big Data Analytics** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 14.204 (Database Management System)

Objective(s): To understand the fundamental concept of Data Science and Big Data Analytics and its application in various fields.

5. **Data and its Classifications**: Data, information, knowledge and wisdom, digital and analog data, unstructured data,semi-structured data ,structured data, sources of data, dealing with unstructured data, data science and responsibilities of data scientist, database, data warehouse, data mining and big data. [10]
6. **Introduction to Big Data**: Big data, characteristics of big data-volume, velocity, variety,challenges with big data, applications of big data in healthcare, agriculture, education, scientific experiments, advertising, stock market etc., integrity and privacy of big data, big data and cloud computing, big data and IoT. [10]
7. **Classification of Analytics:** Descriptive, diagnostic, discovery, prescriptive and predictive analytics, big data analytics, semantic analytics, in-memory analytics, analytics and decision making, shared nothing architecture, CAP theorem, parallel and distributed system, massively parallel processing. [10]
8. **Hadoop and its Architecture**: RDBMS and Hadoop, master slave architecture, HDFS, name node, secondary name node, data node, HDFS client, replica placement strategy, MapReduce, job tracker, task tracker, map phase, reduce phase, shuffle phase, Hadoop 1.0 and Hadoop 2.0, YARN, Installation of Hadoop in pseudo distributed mode and full distributed mode. [10]

Outcome(s): On successful completion of this course, students will be able to

- Apply learning and knowledge ofData Science and Big Data Analytics to solve real life problems in various areas of social importance.

Text Books:

ET 463 **Enterprise Computing – I** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS14.101 (Programming Language), CS 14.204 (Database Management System)

Objective(s):
- To define enterprise computing
- To provide an in-depth and comprehensive knowledge of the hardware and software architecture of enterprise system
- To introduce about the enterprise standards

6. **Characteristics of Enterprise Computing:** Reliability, availability, scalability, capacity, access to large amount of data, integrity and security, system management, autonomic capabilities. [5]
7. **Introduction to TSO & ISPF:** Logging in a mainframe, understanding ISPF menus, understanding datasets & record length, sequential, partitioned VSAM, creation of a PDS for programs, JCL etc. vs Loadlib, creation of a sequential DS for application data, understanding catalog, using ISPF editor. [10]
8. **JCL & SDSF Basics:** Basic JCL programming, modifying an existing compile, link and execute JCL for specific use, JOBCARD, DD statements, understanding JOB-STEP, understanding JOBLIB and STEPLIB, understanding PARM to move data from JCL to program, understanding SDSF outputs. [10]
9. **Basic Application Programming:** Understanding logical file name (used in program) and physical file name (used in JCL) and how they are mapped, writing a simple COBOL program with data stored in a VSAM file or a flat file (intent is not to teach COBOL language, the student should be able to apply the language in the environment, student will be provided with sample JCLs & VSAM file that will be used in program). [10]
10. **Introduction to SPUFI:** Understanding how to use SPUFI environment to write and execute SQL statements. [5]

Outcome(s): On successful completion of this course, students will be able to
- Describe the hardware and software architecture of an actual enterprise platform and explain the main functionality of the physical and virtual components.
- Perform basic administrative tasks in an enterprise computer system such as: the creation of new users, job monitoring and management, and back-ups and re- store operations.
- Possess basic practical knowledge regarding the process of installing, configuring and operating applications in an enterprise computer system as well as applying updates to the operating system

Text Book:

5. Alex Leon , IBM Mainframe Handbook, 1/e PB 1st Edition.
6. Alan Simon, "Network Re-engineering: Foundations of Enterprise Computing", Academic Press, 2012.
7. Mike Ebbers, John Kettner, Wayne O'Brien, Bill Ogden, IBM Redbooks, "Introduction to the New Mainframe: z/OS Basics", IBM Redbooks, 2012.

ET-362 **Mobile Apps Development** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): CS 14.202(Java Programming)

Objective(s):

- To learn how mobile apps are different from others traditional apps by learning those aspects of mobile programming that make it unique from other platforms
- Program mobile applications for the Android operating system that use basic and advanced phone features
- Deploy applications to the Android marketplace for distribution.

6. **Getting started with Mobility:** Mobility landscape, mobile platform, mobile apps development, overview of android platform, setting up the mobile app development environment along with an emulator, a case study on mobile app development. [8]

7. **Building blocks of mobile apps: Apps user:** Interface designing-mobile UI resources (Layout,UI elements, Draw-able,Menu), activity-states and life-cycle, interaction amongst activities. app-functionality beyond user interface- threads, async task, service –state and life cycle, notification, broad cast receivers, telephony and smsapis native data handling-on device file I/O, shared preferences, mobile database such as SQLite, and enterprise data access(via Internet/Intranet) [15]

8. **Sprucing up mobile apps:** Graphics and animation- custom views, canvas, animation APIs, multimedia-audio/video playback and record, location awareness, and native hardware access (sensor such as accelerometer and gyroscope). [8]

9. **Testing mobile apps:** Debugging mobile apps, whiteboxtesting,blackbox testing, and test automation of mobile app, JUnit for Android, Robotium, Monkey Talk. [6]

10. **Taking apps to market:** Versioning signing and packaging mobileapps, distributing apps on mobile market place. [3]

Outcome(s): On successful completion of this course, students will be able to

- Understand the android operating system in details
- Create mobile application for various screens
- Deploy on play store market
- Use various sensors available in mobile

Text Books:

1. Barry Burd, Android Application Development All in One for Dummies, Johen Wiley & Sons Inc., Edition I , 2011.

2. Anubhav Pradhan ,Anil V Deshpandy, Mobile App Development, Edition I

Reference Books: 1.Lauren Darcey, Shane Conder,"Teach Yourself Android Application Development in 24 Hours",Sams Publishing, 2012, 2nd Edition , 2012.

CS-14.451 **Soft Computing Laboratory** **Credit: 0-0-2-1**

Prerequisite(s): CS14.111(Programming Language Laboratory)

Objective(s):

- To implement heuristic search techniques.
- To implement neural networks for solving problems.
- To solve problems using fuzzy logic.
- To implement genetic algorithms.

Content: Lab manual based upon the theory course CS 14.401 and to achieve the listed course objectives and outcomes

Outcome(s): On successful completion of this course, the students will be able to

- Implement soft computing techniques for different problems.
- Develop soft computing models to handle non deterministic problems.
- Analyze and synthesize the performance of developed solution with relevant parameters.

CS-14.455 **Digital Image Processing Laboratory** **Credit: 0-0-2-1**

Prerequisite(s): CS14.111(Programming Language Laboratory)

Objective(s):

- To implement image transforms and analyze their performance.
- To implement image enhancement methods.
- To apply morphological operations on images.
- To implement image compression algorithms and analyze the efficiency.

Lab manual based upon the theory course CS 14.405 and to achieve the listed course objectives and outcomes

Outcome(s): On successful completion of this course, the students will be able to

- Apply basic operations on an image like read, write, binarizeetc.
- Apply image transforms and analyze their performance.
- Develop morphing algorithms as per the need.
- Extract features from image using segmentation.
- Compress a given image and analyze its performance.

CS-14.471 **Minor Project** **Credit: 0-0-0-5**

Prerequisite(s): CS14.111(Programming Language Laboratory)

Objective(s):

- To identify and formulate an engineering problem.
- To design a model or process to solve the formulated problem.
- To develop the solution by implementing the proposed design.
- To work in team to contribute to the development of project.
- To analyze and synthesize the product against critical and relevant parameters.

Content: Students will develop (preferably in a team) a project under guidance of faculty member based upon the area of interest of both student and faculty member.

Outcome(s): Preferably should cover most of the student outcomes.

CS-14.473 **Industrial Training Seminar** **Credit: 0-0-0-2**

Prerequisite(s): NIL

Objective(s):

- To observe and analyze the problem solving process/model on ground.
- To comprehend the acquired knowledge on field.
- To get some hands on practice on relevant technologies used in real life problem solving.
- To present the acquired knowledge to larger audience.

Content:

Students have to present the findings/observation while at training at some industry. They have to submit a report also clearly mentioning the outcomes of the training.

Outcome(s):

On successful completion of this course, the students will be able to

- Communicate effectively to arrange of audience.
- Recognize the need for continuous learning.
- Analyze and synthesize engineering problems and their solutions.

CS 14.402 **Distributed Systems** **Total Lectures: 40**

Credit: 3-0-0-3

Prerequisite(s): CS 14.202 (Java Programming), CS 14.303 (Operating Systems), CS 14.306 (Computer Networks)

Objective(s): To make students aware of:

- What a distributed system is, its example, use and utilities.
- Hardware and software requirements/constraints for implementation of distributed systems.
- Abstractions like, RMI, distributed objects, RPC, distributed shared memory etc.
- Notion of time in a distributed system.
- Databases in a distributed system.

9. **Characterization of Distributed Systems:** Definition, distributed systems-Internet, intranet, mobile, ubiquitous computing, resource sharing and World Wide Web challenges-heterogeneity, openness, security scalability failure handling concurrency and transparency. [3]
10. **System Models:** Architecture models- software layers, system architecture, variations on client-server model, interfaces, design requirement for distributed architectures, fundamental and interaction models, and failure and security models. [4]
11. **Distributed Object and Remote Invocation:** Introduction to remote method invocation (RMI) and interface in distributed systems, communication between distributed objects-objects model, distributed objects, distributed objects model and design issues for RMI, implementation of RMI and distributed garbage collection, remote procedures call and sun RPC case study, events and notifications participants, JINI distributed event specification, Java RMI case study, building client and server programs, design and implementation of Java RMI. [8]
12. **Time and Global State:** Clocks, events and process states, synchronizing physical clocks-synchronization in a synchronous system, Cristian method for synchronizing clocks, Berkley algorithm, network time protocol, global state and consistent cuts. [5]
13. **Distributed Shared Memory:** Introduction, message passing versus DSM, implementation approaches to DSM, design and implementation issues-structure and synchronization model. [5]
14. **Distributed Database Systems:** Distributed DBMS architecture, distributed database design, alternate design strategies, distribution design issues, fragmentation, and allocation. [5]
15. **Processes and Processors in Distributed Systems:** Threads, system models, processor allocation, scheduling, fault tolerance. [5]
16. **Distributed File System:** Design, implementation, trends in distributed file system. [5]

Outcome(s): On successful completion of the course the student will be able to:

- Understand the concept of distributed systems.
- Explain the principles underlying the functioning of distributed systems as well as how these principles are applied in distributed systems.
- Comprehend the problems and challenges of distributed systems.
- Understand and estimate the impact of different design choices, system features on distributed systems.

Text Books:

3. Colouris, “Distributed Systems Concepts and Design”, Addison Wesley, 5th edition, 2011.
4. George Coulouris, Jean Dollimore, Tim Kindberg, Gordon Blair,"Distributed Systems" , Pearson Education Limited, 2013

Reference Books:

3. Pradeep K. Sinha,"Distributed Operating Systems",PHI Learning Pvt. Limited, 2011.
4. MukeshSinghal, NiranjanShivrathri, “Advanced Concepts in Operating Systems”, TMH,

2011.

CS 14.412 **Software Project Management** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): CS 14.302 (Software Engineering)

Objective(s):

- To introduce the concepts of Software Project Management to the students.
- To make the students understand the requirement for project evaluation.
- To make the students understand the requirement for Software quality assurance and project management along with its tools.

18. **Introduction to Software Project Management (SPM) : S**oftware Engineering problem and software product, software product attributes, definition of a Software Project (SP), SP vs. other types of projects activities covered by SPM, categorizing SPs, Project Management cycle, SPM framework, types of project plan **[6]**
19. **Project Evaluation:** Strategic assessment, technical assessment, cost benefit analysis, cash flow forecasting, cost benefit evaluation techniques, risk evaluation **[5]**
20. **Activity Planning:** Objectives, project schedule, sequencing and scheduling activities, networkplanning models, forward pass, backward pass, activity float, shortening projectduration, activity on arrow networks, risk management, nature of risk, types ofrisk, managing risk, hazard identification, hazard analysis, risk planning and control **[8]**
21. **Monitoring and Control:** Introduction, creating the frame work, collecting the data, visualizing progress, cost monitoring, earned value, prioritizing monitoring, getting the project back to target, change control **[6]**
22. **Managing people and Organizing teams:**Introduction,understandingbehaviour, organizational behaviour: a background,selecting the right person for the job, instruction in the best methods, motivation, the Oldman, Hackman job characteristics model, working in groups, becominga team, decision making leadership, organizational structures, stress, health and safety, case studies **[8]**
23. **Software Quality Assurance and Testing:** Testing principles and objectives, test plan, types and levels of testing, test strategies, program verification and validation, software quality, SEI-CMM,SQA activities, QA organization structure, SQA plan **[7]**

Outcome(s):

Upon completion of the course the student should be able to:

- Examine the fundamentals of the software project and the factors involved in using a methodology in the context of project management.
- Explain the risks, issues, and critical success factors associated with technology projects and software projects in particular.
- Create a project plan, including scope definition, risk assessment, task breakdown, team selection, estimates, communication mechanisms and progress evaluation and reporting using an appropriate project lifecycle.
- Present and justify a fully documented project plan.
- Employ appropriate software for project planning, estimation, monitoring and control, communication and reporting.

6. Walker Royce ,Software Project Management, , 1998, Addison Wesley.

CS 14.414 **Technologies of Big Data** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 14.415 (Data Science and Big Data and Analytics)

Objective(s): To understand and learn various technologies of Big Data Analytics and apply them to solve real world problems.

6. **Hadoop and MapReduce** :Functional programming , MapReduce programming, running a MapReduce programs on Hadoop, word count, distributed sort, distributed grep. [7]

7. **Hive**: Hive, HiveQL vs SQL, Hive in Hadoop ecosystem, installation of Hive, query execution in Hive, data types and file formats, create table, alter table, drop table, loading data into tables, select-from clause, where clause ,group by clause, join statements, views and indexes. [10]

8. **Pig**: Pig , PigLatin, Pig on Hadoop, installing and running Pig, Grunt, Pig data models, load, store and dump, relational operations-foreach, filter, groupby, orderby, distinct, Join, user defined functions(UDFs),developing and testing PigLatin scripts. [10]

9. **Spark** : Spark, Hadoop versus Spark, Installation of spark, spark architecture, solving business problem with Spark, Spark streaming framework and processing models. [7]

10. **NoSQL Databases** :NoSQL, database scaling, CAP theorem , ACID versus BASE, key – value stores, column oriented databases, document databases ,graph databases, NoSQL challenges. [6]

Outcome(s): On successful completion of this course, students would be able to

- Apply learning and knowledge of Big Data technologies tosolve real world problems and acquire required skills set for industry.

Text Books:

3. Chuck Lam, “Hadoop in Action”, Manning Publications,2nd ed. 2015, ISBN: 9781935182191
4. Edward Capriolo, Dean Wampler, Jason Rutherglen,“Programming Hive”, O’Reilly Media,2016,ISBN: 978-1-449-31933-5

Reference Books:

3. Alan Gates, “Programming Pig”, O’Reilly Media,2011,ISBN: 978-1-449-30264-1
4. James A. Scott, “Getting Started with Apache Spark”, MapR Technologies,2015

CS 14.416 **Designing of IoT** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 14.101 (Programming Languages), CS 14.303 (Operating System), CS 14.306 (Computer Networks)

Objective(s):
- To understand IoT architecture and IoT design constraints
- To understand the vision and impact of IoT
- Understand IoT Market perspective.

6. **Internet/Web and Networking Basics** : OSI Model, data transfer referred with OSI model, IP addressing, point to point data transfer, point to multi point data transfer & network topologies, sub-netting, network topologies referred with web, introduction to web servers, introduction to cloud computing [5]
7. **IoT Platform Overview:** Overview of IoT supported hardware platforms such as: raspberry pi, ARM cortex processors, arduino and intel galileo boards, network fundamentals: overview and working principle of wired networking equipment's – router, switches, overview and working principle of wireless networking equipment's – access points, hubs etc. linux network configuration concepts: networking configurations in linux accessing hardware & device files interactions. [7]
8. **IoT Architecture:** History of IoT, M2M – machine to machine, web of things, IoT protocols, remote monitoring & sensing, remote controlling, performance analysis, the layering concepts , IoT communication pattern, IoT protocol architecture, the 6LoWPAN, security aspects in IoT. [8]
9. **IoT Application Development**: MQTT, REST/HTTP, CoAP, MySQL, apache for handling HTTP Requests, PHP & MySQL for data processing, MongoDB object type database, HTML, CSS & jQuery for UI designing, JSON lib for data processing, security & privacy during development, application development for mobile platforms: overview of android / IOS app development tools. [13]
10. **Case Study & advanced IoT Applications:**IoT applications in home, infrastructures, buildings, security, Industries, home appliances, other IoT electronic equipments, use of big data and visualization in IoT, industry 4.0 concepts, sensors and sensor node and interfacing using any embedded target boards (Raspberry Pi / Intel Galileo/ARM Cortex/ Arduino) [7]

Outcome(s): On successful completion of this course, students will be able to:
- Explain the current status and expected future directions of the internet of things.
- Identify and propose applications which advance the IoT.
- Develop applications which advance the IoT.

Text Books:

4. Dr.OvidiuVermesan, Dr. Peter Friess, "Internet of Things: Converging Technologies for Smart Environments and Integrated Ecosystems", River Publishers,2013
5. Jean-Philippe Vasseur, Adam Dunkels, "Interconnecting Smart Objects with IP: The Next Internet", Morgan Kuffmann, 2010.
6. Zach Shelby, Carsten Bormann, "6LoWPAN: The Wireless Embedded Internet", Wiley, 2011.

Reference Books:

3. Asoke K Talukder and Roopa R Yavagal, "Mobile Computing", 4th ed. Tata McGraw Hill, 2010.
4. F. Adelstein and S.K.S. Gupta, "Fundamentals of Mobile and Pervasive Computing", McGraw Hill, 2009.

ET 474 **Enterprise Computing – II** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 463 (Enterprise Computing – I)

Objective(s):
- To define advance JCL.
- To provide an in-depth and comprehensive knowledge of the hardware and software architecture of enterprise system.
- To introduce about the enterprise standards.

4. **Advanced JCL:** Coding a JCL, using PROCS (Catalog and In-Stream), using DFSORT, ICETOOL. [8]
5. **Advanced Datasets:** Understanding record length, allocation of SPACE, fixed and variable record length, VSAM, defining VSAM, understanding CI and CA, GDG, understanding usage of GDG, defining GDG. [12]
6. **Understanding CICS:** CICS fundamentals, understanding transactions, pseudo conversational programming, understanding CICS tables, coding BMS maps, compiling of a CICS program & NEWCOPY + CEMT entry for programs, writing simple CICS program to read key data (say StudentID) from user & display details obtained from a VSAM, CICS tables for VSAM/DB2 will be provided. [20]

Outcome(s): On successful completion of this course, students will be able to
- Describe the hardware and software architecture of an actual enterprise platform and explain the main functionality of the physical and virtual components.
- Perform basic administrative tasks in an enterprise computer system such as: the creation of new users, job monitoring and management, and back-ups and re- store operations.
- Possess basic practical knowledge regarding the process of installing, configuring and operating applications in an enterprise computer system as well as applying updates to the operating system

Text Book:

3. IBM Mainframe Handbook by Alex Leon.
8. Alan Simon, "Network Re-engineering: Foundations of Enterprise Computing", Academic Press, 2012.
4. Mike Ebbers, John Kettner, Wayne O'Brien, Bill Ogden, IBM Redbooks, "Introduction to the New Mainframe: z/OS Basics", IBM Redbooks, 2012.

CS 14.422 **Software Testing and Quality Assurance** **Total Lectures: 40**
Credit: 3-1-0 -4

Prerequisite(s): CS 14.302 (Software Engineering)

Objective(s):

- To explore the basics and goals of software testing
- To discuss various types of software testing and its techniques
- To list out various tools that can be used for automating the testing process
- To introduce various software quality standards for establishing quality environment
- To discuss various methods and evaluation procedures for improving the quality Models

6. **Basics of Software Testing**: Definition, test cases, insights from a Venn diagram, identifying test cases, error and fault taxonomies, levels of testing, examples: generalized pseudo-code, the triangle problem, the NextDate problem, the commission problem [6]
7. **Decision Table Based Testing:** Decision tables, test cases for triangle problem, test cases for Next Date problem, test cases for commission problem, data flow testing, use testing, slice based testing, guidelines and observation, traditional view of testing levels, alternative life-cycle models, separating integration and system testing, decomposition based, call graph based, path based integration, case study [10]
8. **System and Interaction Testing:** Threads, basic concepts of requirements specification, finding threads, structural strategies and functional strategies for thread testing, SATM test threads, system testing guidelines, interaction testing, a taxonomy of interactions, composition, and determinism, client-server testing, issues in object-oriented testing, inheritance and polymorphism, levels of object-oriented testing, GUI testing, dataflow testing for object-oriented software, examples and case study [10]
9. **Object-Oriented Integration Testing**: UML support for integration testing, MM paths for object-oriented software, GUI testing, unit testing, object-oriented system testing, UML based system testing, statechart based system testing [6]
10. **Quality Assurance:** Software quality, level of measurement, reliability and validity, Ishikawa's seven basic tools, cause and effect diagram, reliability models, quality and quality management metrics, software process maturity assessment [8]

Outcome(s): On successful completion the students will be able to:

- Compare and pick out the right type of software testing process for any given real world problem
- Carry out the software testing process in efficient way
- Automate the testing process by using several testing tools
- Establish a quality environment as specified in standards for developing quality software
- Analyze and improve the quality procedures based on the past experience

Text Books:

3. Paul C. Jorgensen, "Software Testing: A Craftsman's Approach", Auerbach Publications, 4th Edition, 2016.
4. Stephen H Khan, "Metrics and Models in Software Quality Engineering", Pearson, 2nd edition 2013.

Reference Books:

4. CemKaner, Rebecca L. Fiedler,"Foundations of Software Testing" , Context-Driven Press, 2013

6. Mauro Pezze, Michal Young,"Software Testing and Analysis – Process, Principles and Techniques", John Wiley & Sons, 2008.

CS 14.424 **Machine Learning with Big Data** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): CS 14.322 (Data Mining)

Objective(s): To learn the fundamental concept of machine learning and apply the concept of recommendations, clustering and classifications on large scale data sets using mahout.

6. **Introduction**: learning problems, designing learning system, perspectives and issues, concept learning, version spaces and candidate elimination algorithm, inductive bias, decision tree learning, representation, heuristic space search [8]
7. **Data Mining, Machine Learning** : Data mining ,machine learning, statistical modeling, feature extraction, computational approaches to modeling, statistical limits on data mining, statistical limits on data mining, Bonferroni's principle, recommendation engines, clustering and classifications, mahout : Mahout, installation and setting up of Mahout, tackling large scale data with mahout and Hadoop [8]
8. **Recommendations:** Defining recommendation, Running a recommender engine, Evaluating a recommender, Evaluating precision and recall, evaluating the GroupLens data set, representing preference data, in-memory data models, coping without preference values, user-based recommendation, item-based recommendation, similarity metrics, slope-one recommender, distributing recommendation computations [8]
9. **Clustering**: Clustering basics, measuring the similarity of items, running a simple clustering example, distance measures, representing data, visualizing vectors, representing text documents as vectors, generating vectors from documents, clustering algorithms in Mahout, k-means clustering, different kinds of clustering problems, fuzzy k-means clustering, model-based clustering, evaluating and improving clustering quality, real-world applications of clustering [8]
10. **Classifications**:Introduction to classification, Mahout for classification, differences between classification, recommendation, and clustering, applications of classification, working of classification, training a classifier, extracting features to build a Mahout classifier, preprocessing raw data into classifiable data, converting classifiable data into vectors, evaluating and tuning a classifier, deploying a classifier [8]

Outcome(s): Students would be able to apply learning and knowledge of machine learning techniquesin the area of Big Data Analytics using Mahoutto solve real life problems.

Text Books:

4. Sean Owen, Robin Anil, Ted dunning, Ellen friedman, "Mahout in Action",Manning Publications,2012,ISBN 9781935182689

4. AnandRajaraman, Jure Leskovec, Jeffrey D. Ullman, "Mining of Massive Datasets", Cambridge University Press, 2015,ISBN:978-1-107-07723-2

CS 14.426 **Wireless and Sensor Networks** **Total Lectures: 40**
Credit: 3-1-0 -4

Prerequisite(s): CS 14.306 (Computer Networks)

Objective(s):

- To provide an overview about wireless and sensor networks and emerging technologies
- To study about the network architecture of sensor nodes and its execution environment
- To understand the concepts of communication, MAC and routing protocols in WSN
- To learn about topology control and clustering for localization services with sensor tasking and control
- To study about sensor node hardware and software platforms and understand the simulation and programming techniques

6. **Overview of Wireless Sensor Networks**: Introduction, characteristics, challenges for WSN, emerging technologies for WSN, advantages of sensor networks, applications. [8]
7. **Architecture:** Single-node architecture, hardware components, energy consumption of sensor nodes, operating system and execution environment, network architecture, single hop vs multi hop, multiple sources and sinks, optimization goals and figures of merit, WSN gateway and tunneling. [8]
8. **Networking Sensors:** Physical layer, MAC protocols for WSN, low duty cycle and wakeup concept S-MAC, address and name management, assignment of MAC addresses, routing protocols, multipath unicast routing, energy efficient routing, geographic routing. [8]
9. **Infrastructure**: Topology control, clustering, multilayer clustering, time synchronization, localization and positioning, positioning in multihop environment, ranging techniques, range based localization, sensor tasking and control, information based sensor tasking, joint routing and information aggregation [8]
10. **Platforms and Tools:** Sensor node hardware, Berkeley motes, programming challenges, node level software platforms, TinyOS, nesC, TinyGALS, simulators, ns2, TOSSIM, state centric programming [8]

Outcome(s): On successful completion the students will be able to:

- Compare and pick out the right type of software testing process for any given real world problem
- Carry out the software testing process in efficient way
- Automate the testing process by using several testing tools
- Establish a quality environment as specified in standards for developing quality software
- Analyze and improve the quality procedures based on the past experience

Text Books:

3. Holger Karl & Andreas Willig, " Protocols And Architectures for Wireless Sensor Networks" , John Wiley, 2007.
4. Feng Zhao, Leonidas Guibas, Jie Liu, , “Wireless Sensor Networks- An Information Processing Approach", 2nd ed. Elsevier, 2016.

Reference Books:

3. KazemSohraby, Daniel Minoli, &TaiebZnati, “Wireless Sensor Networks- Technology, Protocols, And Applications”, John Wiley, 2007.
4. Anna Hac, “Wireless Sensor Network Designs”, John Wiley, 2003.

CS 14.418 **Software Defined Networking** **Total Lectures: 40**
Credit: 3-1-0 -4

Prerequisite(s): CS 14.302 (Software Engineering), CS 14.306 (Computer Networks)

Objective(s):

- To explore the basics of SDN
- To discuss various types plane
- To list out various controllers
- To program a simple SDN

6. **Control and Data Planes**: Introduction, evolution vs revolution, the control plane, data plane, moving information between planes, distributed control planes, convergence time, load balancing, creating the MPLS overlay, centralized control planes, logical vs literal, ATM.LANE, route servers. [8]
7. **SDN Controllers:** Wire protocol, replication, FAWG, hybrid approaches, SDN controllers, VMware, Nicira, OpenFlow, Mininet, NOX/POX, Trema, Ryu, L3VPN, RSPV-TE problem statement, bin-packing, deadlock, Plexxi, Cisco OnePK. [8]
8. **Network Programmability:** The management interface, the application-network divide, NETCONF and NETMOD, SNMP, modern programmatic interface, XMPP, JSON, I2RS, OpenStack, CloudStack, Puppet, virtual multitenant data center, SDN solution for data center networks. [8]
9. **Network Function Virtualization**: Virtualization and data plane I/O, services engineered path, service locations and chaining, NFV at ETSI, non-ETSI NFV work, network topology, LLDP, BGP-TE/LS, ALTO, I2RS topology. [8]
10. **Building an SDN framework:** Build code first, ask questions later, the Juniper SDN framework, IETF SDN framework, open daylight controller/framework, use cases for bandwidth scheduling, manipulation, data center overlays, big data, NFV, and traffic monitoring. [8]

Outcome(s): On successful completion the students will be able to:

- Describe the key benefits of SDN
- Describe the data plane
- Configure an SDN friendly network emulator
- Program a simple SDN for a given task using a low level approach and high level approach
- Evaluate a sample SDNs performance and reliability

Text Books:

2. Ken Gray, Thomas D Nadeau, “SDN: Software Defined Networks”, O’Reilly, 2013.

6. Patricia A Morreale, James M. Anderson, “Software Defined Networking: Design and Deployment”, CRC Press, 2014.

CS-14.452 **Distributed Systems Laboratory** **Credit: 0-0-2-1**

Prerequisite(s): CS14.111(Programming Language Laboratory), CS 14.222(Java Programming Lab.)

Objective(s):

- To implement different abstractions of distributed systems.
- To understand the working principle of different theoretical abstractions like RMI, RPC, distributed shared memory etc.
- To understand the notion of logical clocks and event ordering in asynchronous distributed system through implementation

Content: Lab manual based upon the theory course CS 14.402 and to achieve the listed course objectives and outcomes

Outcome(s): On successful completion of this course, the students will be able to

- Analyze the working principles of different distributed system abstractions.
- Formulate programming models for DS concepts like RMI, RPC, distributed shared memory etc.
- Recognize event ordering in an asynchronous distributed system.

CS-14.472 **Major Project** **Credit: 0-0-0-10**

Prerequisite(s): CS14.111(Programming Language Laboratory)

Objective(s):

- To identify and formulate an engineering problem.
- To design a model or process to solve the formulated problem.
- To develop the solution by implementing the proposed design.
- To work in team to contribute to the development of project.
- To analyze and synthesize the product against critical and relevant parameters.

Content: Students will develop (preferably in a team) a project under guidance of faculty member based upon the area of interest of both student and faculty member.

Outcome(s): Preferably should cover most of the student outcomes.

CS-14.474 **Technical Seminar** **Credit: 0-0-0-1**

Prerequisite(s): NIL

Objective(s):

- To observe and analyze some latest technology.
- To comprehend the acquired knowledge.
- To present the acquired knowledge to larger audience.

Content: Students have to comprehend and present on some latest development in the field of computing. They have to submit a report also clearly mentioning the significance and limitations of the technology and its social impact.

Outcome(s): On successful completion of this course, the students will be able to

- Communicate effectively to arrange of audience.
- Recognize the need for continuous learning.
- Recognize the social impact of engineering solutions.

List of Electives

Elective – III	
CS-14.411	Advanced Computer Architecture
CS-14.413	Foundations and Applications of IoT
CS-14.415	Data Science and Big Data Analytics
ET 463	Enterprise Computing-I **(IBM)**
ET-362	**Mobile App Development (Infosys)**
Elective – IV	
CS-14.412	Software Project Management
CS-14.414	Technologies of Big Data
CS-14.416	Designing of IoT
ET 474	Enterprise Computing-II
Elective – V	
CS-14.422	Software Testing and Quality Assurance
CS-14.424	Machine Learning with Big Data
CS-14.426	Wireless and Sensor Networks
CS-14.418	**Software Defined Networking**

CS-18.307	Big Data Programming	Total Lectures: 40
		Credit:3-0-0-3
Prerequisite(s):	Basic knowledge of Linux • Basic SQL knowledge • Working knowledge with big data and Hadoop technologies • Have a basic understanding of notebook technologies for data science • Students can attend free courses at www.bigdatauniversity.com to acquire the necessary requirements • Exposure to the IBM Skills Academy Portal learning environment • Exposure to the IBM Skills Academy Cloud hands-on labs platform	
Objective(s):	• To Understand what Big Data is • To understand how the growth of interconnected devices helps big data. • To Learning the tools that will enable to continue big data education after the course	
1.	**BIG DATA OVERVIEW**: Introduction to Big Data, Introduction to the Big Data Ecosystem, Introduction to Hortonworks Data Platform (HDP), Apache Ambari, Hadoop and HDFS, MapReduce and YARN, Apache Spark, Storing and quering data, ZooKeeper, Slider, and Knox, Loading data with Sqoop, Security and Governance, Stream Computing, Exercise: Exploration of the lab environment, Managing Hadoop clusters with Apache Ambar, File access and basic commands with HDFS, Running MapReduce and YARN jobs, Creating and coding a simple MapReduce job, Working with a Spark RDD with Scala, Using Hive to access Hadoop/HBase data, Explore Zookeeper, Moving data into HDFS with Sqoop,	[20]
2.	**Introduction to Data Science**: Data Science and Data Science Notebooks, Data Science with Open Source Tools, Exercise: Moving data into HDFS with Sqoop	[5]
3.	**Big SQL**: Using Big SQL to access data residing in the HDFS, Creating Big SQL schemas and tables, File formats and querying Big SQL tables, Managing the Big SQL Server, Configuring Big SQL security, Data federation with Big SQL, Exercise: Connecting to the IBM Big SQL Server, Creating and managing Big SQL schemas and tables, Querying Big SQL tables, Managing the Big SQL Server, Configuring Big SQL security, Configuring impersonation in Big SQL, Using Fluid Query with Big SQL.	[9]
4.	**IBM Watson Studio:** Introduction to IBM Watson Studio, Analyzing data with Watson Studio,Exersice: Getting started with Watson Studio, Analyzing data with Watson Studio.	[6]
Outcome(s):	On the successful completion of the course, the student will be able to: • Hadoop and the Hadoop Distributed File System•Analyze the time and space complexity of algorithms. • Apache Spark. • ZooKeeper, Slider, and Knox	
Text Books:	1. IBM Study Material	
Reference Books:		

CS-18.205	Application Development for Cloud	Total Lectures: 40
		Credit:3-0-0-3
Prerequisite(s):	Basic knowledge of JavaScript. • Basic knowledge of Eclipse-based development tools • Basic understanding of HTML • Basic understanding of the IBM Skills Academy learning environment • Basic understanding of the IBM Skills Academy Cloud hands-on labs platform	
Objective(s):	To Define cloud computing • To Describe the choices that are available to developers when creating cloud applications • To Describe infrastructure as a service, platform as a service, and software as a service • To Describe IBM Cloud • To Describe the architecture of IBM Cloud	
1.	**CLOUD APPLICATION FOUNDATIONS**: Introduction to HTML5 and JavaScript Programming, JavaScript programming for web applications, HTML5 features,Exersices: Working with JavaScript in HTML documents, Working with HTML5 features	[8]
2.	**CLOUD APPLICATION DEVELOPER**: Essentials of Cloud Application Development, Introduction to cloud computing and IBM Cloud, Getting started with IBM Cloud, Developing IBM Cloud applications on a local workstation, Adopt a DevOps approach by using IBM Cloud Continuous Delivery, REST architecture and Watson APIs, Introduction to data services in IBM Cloud, IBM Cloud mobile backend as a service, Exercise: IBM Cloud command line interface (CLI), Develop IBM Cloud applications with Eclipse, Developing IBM Cloud applications with IBM Cloud Continuous Delivery, IBM Cloud with Cloudant,Build a mobile application by using Kinetise,	[20]
3.	**Developing Cloud Applications with SDK for Node.js**: Introduction to server-side JavaScript, Asynchronous I/O with callback programming, Express web application framework, Exercise :Developing a Hello World Node.js app on IBM Cloud, Understanding asynchronous callback, Creating your first express application, Understanding asynchronous callback Building a rich UI application by using AngularJS with Node.js	[12]
Outcome(s):	On the successful completion of the course, the student will be able to: •Understand asynchronous callbacks and be able to write the code in a Node.js application •Understand Express routing •Understand IBM Watson Natural Language Understanding service •Use the Fetch API to interact with back-end web services	
Text Books:	IBM Study Material.	
Reference Books:		

CS-18.338	Predictive Modeling Analytics	Total Lectures: 40
		Credit:3-0-0-3
Prerequisite(s):	• English Proficiency • Basic Internet and web browser usage experience • Basic analytics experience	
Objective(s):	□ To understand how analytics provided a solution to industries using real case studies □ To Explain what is analytics, the various types of analytics, and how to apply it □ To Improve efficiency, sample records, and work with sequence data □ To Integrate and collect data □ To Understand the principles of data mining	
1.	**Business Analytics Overview**: Analytics overview, Analytics trends, Towards a predictive enterprise, Analytics: Industry domains , Case studies and solutions. Business Intelligence and Analytics	[5]
2.	**Introduction to A Predictive Analytics Platform & Data Mining**: Introduction to data mining, Working with modeler, A Data-mining tour ,Collecting initial data , Understanding your data ,Setting the unit of analysis ,Integrating data ,Deriving and reclassifying fields, Looking for relationships ,Introduction to modeling , Exercise: On the basis of all above topics.	[10]
3.	**Advanced data preparation**: Using functions, Data transformations, Working with sequence data, Sampling records, Improving efficiency. Exercise on the basis of all above topics.	[10]
4.	**Automated Data Mining**: Introduction to data mining ,The basics of using a modeler ,Reading data files , Data exploration , Automated data preparation ,Data partitioning, Predictor selection for modeling ,Automated models for categorical targets , Model evaluation , Automated models for continuous targets ,Deploying models Exercise :Adding nodes and creating streams in the modeler ,Reading a data file and typing the data in the source node , Review missing values in modeler and use the data audit node on the charity data , Practice using the ADP node to prepare data for modeling ,Use a partition node to split the charity data for modeling ,Use the feature selection node to select fields and predict a response ,Using the auto classifier node to construct a model in order to predict a response, Evaluate the model created to predict the field response ,Develop a model to predict the total spending , Use a scoring stream to make predictions	[15]
Outcome(s):	On the successful completion of the course, the student will be able to: • Understand the principles of data mining • Use the user interface of modeler to create basic program streams • User a partition node to create training and testing data subsets • Use a model to score new data	
Text Books:	IBM Study Material.	
Reference Books:		

CS 18.409	Block Chain	Total Lectures: 40
		Credit: 3-0-0-3
Prerequisite(s):	• Basic knowledge of JavaScript, Node.js, Angular.js, Golang, Docker, and Kubernetes • Exposure to the IBM Skills Academy Portal learning environment • Exposure to the IBM Skills Academy Cloud hands-on labs platform	
Objective(s):	To Explain block chain and how it is applied across industries To Understand the benefits of a blockchain platform To Explain what is Hyperledger Composer, how it fits into blockchain, and its applications To Explain the elements of a business network, the role of channels, and how the world state is maintained To Understand block chain deployment, security and integration capabilities	
1.	**Blockchain overview**: What is Blockchain? The business backdrop, The problem area, Relation to Bitcoin, Difference between Bitcoin and Blockchain, Requirements for a blockchain in a business environment, Requirements deep dive, Apply blockchain to business, Why blockchain is relevant for business, Consensus: Shared Reference Data Example, Provenance: Supply Chain Example, Immutability: Audit and Compliance Example, Finality: Letter of Credit Example, Industry Use Cases, Hyperledger Composer, Hyperledger Fabric, Blockchain for Financial Services	[10]
2.	**Blockchain Foundations**: HTML5 overview, JavaScript programming for web applications, HTML5 features, Working with HTML 5 features, Node.js, Server-Side JavaScript, Creating a Node.js Web Application, Asynchronous I/O with callback programming, Refactor weather project, , Working with JavaScript in HTML documents.	[10]
3.	**Docker Essentials** : Introduction to Docker, Add value CI/CD with Docker Images, Introduction to Orchestration, Get started with Kubernetes, Virtual machines, containers, and Kubernetes, Relationship between Kubernetes and containers, Deploy an application with IBM Watson services.	[10]
4.	**Blockchain Developer:** Blockchain Overview, Introducing Hyperledger Composer, Understanding Blockchain Solution Architecture, Blockchain in-depth, Hyperledger Fabric Application Development, Understanding Blockchain Deployment Options, Understanding Blockchain Security, Blockchain Integrated, Applying blockchain concepts to the vehicle manufacture lifecycle use case, Developing a blockchain user application with Hyperledger Composer SDK, Developing a client application for Hyperledger Fabric, Integrating blockchain with other systems,	[10]
Outcome(s):	On the successful completion of the course, the student will be able to: • Understand blockchain and how it is applied across industries • Understand the role of a shared ledger • Understand the benefits of a blockchain platform • Understand what is Hyperledger Composer, how it fits into blockchain, and its applications • Understand the blockchain solution architecture	
Text Books:	IBM Study Material.	
Reference Books:		

CS 18.216	Application Security	Total Lectures: 40
		Credit: 3-0-0-3
Prerequisite(s):	• Basic web development knowledge • Basic knowledge on HTML and HTTP • Basic knowledge of application security	

	• Exposure to the IBM Skills Academy Portal learning environment • Exposure to the IBM Skills Academy Cloud hands-on labs platform	
Objective(s):	• To Describe the emerging threats and leaks as the world is becoming digitalized • To Understand the security dynamics of securing the enterprise • To Understand relational database concepts and how to work with database objects • To Describe how to work with select statements, DML statements, and multiple tables • To Understand how to use JOINs in SQL • To Understand the basics of HTML5 (objectives, document types that are supported, browser support etc.) • To Understand glass box scanning, content based scanning, and troubleshooting	
1.	**Cyber Security Overview**: Emerging threats and leaks as the world is becoming digitalized, The changing dynamics of securing the enterprise, A new approach to security, The foundation of approach to security the enterprise, IT Security Frameworks, Security Intelligence as a foundation of all security programs, IBM Security.	[5]
2.	**Application Security Foundations**: SQL Fundamentals, Relational database concepts, Working with database objects, Reading data, Inserting, updating, and deleting data, Working with multiple tables, exercises on Relational database exercise, Creating, modifying and deleting database objects ,Inserting, updating, and deleting data.	[9]
3.	**Introduction to HTML5 and JavaScript Programming:** HTML5 overview, JavaScript programming for web applications, HTML5 features, Working with JavaScript in HTML documents, Working with HTML5 features.	[9]
4.	**Web Application Security Fundamentals:** The web application security problem, Web application basics, Injection flaws, Broken authentication and session management, Cross-Site scripting, Insecure direct object reference, Security misconfiguration, Sensitive data exposure, Missing function level access control, Cross-site request forgery (CSRF), Using components with known vulnerabilities, Unvalidate redirects and forwards, Integrating security in the software development lifecycle	[9]
5.	**Web Application Security Solution Fundamentals:** Web application security overview, Installation and setup, Preparing for scan, Configuring first scan, Reviewing the results, Reporting, Logging in and managing sessions, Configuring explore options, Optimizing your scan, Glass box scanning, Content-based scanning, Reviewing scan coverage, Scanning web services, Extending the security web application solution, Troubleshooting,	[8]
Outcome(s):	• Understand relational database concepts and how to work with database objects • Describe how to work with select statements, DML statements, and multiple tables • Understand how to use JOINs in SQL • Understand the basics of HTML5 (objectives, document types that are supported, browser support etc.) • Understand the basics of JavaScript • Describe the web application security problem and web application basics	
Text Books:	IBM Study Material.	
Reference Books:		

CS 18.407	Artificial Intelligence	Total Lectures: 40
		Credit: 3-0-0-3
Prerequisite(s):	• English Proficiency • Exposure to the IBM Skills Academy Portal learning environment	
Objective(s):	• To Describe the field of AI and its subfields machine learning, NLP and computer vision • To Describe the types of AI • To Describe the types of machine learning: Supervise learning, unsupervised learning, and deep learning • To Describe the purpose of training the various Watson services to adapt them to a closed-domain • To Use Watson API Explorer to interact with the Watson services REST API, to rest your calls to the • To Define chatbots • To Explain the factors that lead to the growing popularity of chatbots • To Identify applications that are good candidates to integrate with chatbots • To Describe the main components that are involved when building a chatbot and explain their purpose • To Describe how to build a chatbot by using the IBM Watson Conversation service	
1.	**Artificial intelligence overview**: Introduction to Artificial Intelligence, Machine Learning, Natural Language Processing, Computer vision, Cognitive Computing.	[5]
2.	**Artificial intelligence foundations**: Introduction to IBM Watson, Evolution from DeepQA to Watson services on IBM Cloud, Build with Watson, Exploring Watson services with Watson API Explorer.	[10]
3.	**Artificial intelligence analyst:** Introduction to Natural Language Processing, Pipeline and concepts, NLP and IBM Watson, Exercises on Ingest, Convert, Enrich, and Query with Watson Discovery Service.	[10]
4.	**Chatbots:** Introduction to Chatbots, Chatbot fundamentals, IBM Watson conversation service.	[8]
5.	**Computer Vision:** Introduction to Computer Vision, Computer Vision fundamentals, IBM Watson Visual Recognition service, Exercise on Classifying images with Watson Visual Recognition.	[7]
Outcome(s):	Understand the relationship between AI and NLP Know the history and advancement of Computer Vision Understand Computer Vision components Learn about the Vision services that are available from IBM Watson.	
Text Books:	IBM Study Material.	
Reference Books:		

CS 18.210	Business Intelligence	Total Lectures: 40
		Credit: 3-0-0-3
Prerequisite(s):	• English proficiency • Microsoft Windows operating system basic experience • Basic Internet and web browser usage experience • Knowledge of an organization's business intelligence and reporting needs • Basic database background is preferred • Basic knowledge of XML is preferred • Exposure to the IBM Skills Academy portal learning environment • Exposure to the IBM Skills Academy cloud hands-on labs platform	
Objective(s):	• To Understand how analytics provided a solution to industries using real case studies • To Explain what is analytics, the various types of analytics, and how to apply it • To Understand how a business analysis software works, and its architecture • To Describe a reporting application, its interface, and the different report types • To Create different types of advanced reports • To Understand Active Reports and how to create them	
1.	**Business Analytics Overview**: Analytics overview, Analytics trends: past, present & future, Towards a predictive enterprise, Analytics: Industry domains, Case studies and solutions.	[5]
2.	**Business Intelligence and Analytics 101 and Business analytics foundations**: Business Intelligence and Analytics 101, IBM Cognos Analytics for Consumers, Business analysis solution for consumers.	[7]
4.	**Business intelligence analyst:** IBM Cognos Analytics: Author Reports Fundamentals, Introduction to IBM Cognos Analytics, Create list reports, Focus reports using filters, Create crosstab reports, Present data graphically, Focus reports using prompts, Extend reports using calculations, Use additional report building techniques, Customize reports with conditional formatting, Drill-through definitions, Enhance report layout, Overview of IBM Cognos Analytics	[12]
5.	**IBM Cognos Analytics: Author Reports Advanced:** Create query models, Create reports based on query relationships, Create advanced dynamic reports, Design effective prompts, Create additional advanced reports, Examine the report specification, Distribute reports through bursting, Enhance user interaction with HTML.	[11]
6.	**IBM Cognos Analytics: Author Active Reports:** Introduction to IBM Cognos Active Reports, Use Active Report connections, Active Report charts, visualizations, and decks.	[5]
Outcome(s):	• Describe a reporting application, its interface, and the different report types • Create different types of advanced reports • Understand Active Reports and how to create them	
Text Books:	IBM Study Material.	
Reference Books:		

CS 18.309	Security Intelligence	Total Lectures: 40
		Credit: 3-0-0-3
Prerequisite(s):	• Basic understanding of the security fundamentals • Basic understanding of the IT infrastructure and IT security fundamentals • Basic understanding of Linux, Windows, TCP/IP networking and Syslog • Exposure to the IBM Skills Academy Portal learning environment • Exposure to the IBM Skills Academy Cloud hands-on labs platform	
Objective(s):	Identify enterprise business and IT drivers that influence the overall IT Security Architecture Define the role of a centralized Security Intelligence solution and how it integrates with other IT enterprise security components Explain how a Security Intelligence solution can be used to investigate and stop advanced threats and address IT governance and regulatory compliance Describe how QRadar SIEM collects data to detect suspicious activities Navigate and customize the QRadar SIEM dashboard Investigate suspected attacks and policy breaches Search, filter, group, and analyze security data Investigate the vulnerabilities and services of assets Locate custom rules and inspect actions and responses of rules Use QRadar SIEM to create customized reports Use charts and apply advanced filters to examine specific activities in your environment	
1.	**Cyber Security Overview**: The status quo of IT Security, Security intelligence and operations,	[5]
2.	**Cyber Security Foundations**: Security Intelligence Fundamentals, Designing a security intelligence solution, Security intelligence functional components,	[10]
3.	**SECURITY INTELLIGENCE ENGINEER:** Security Intelligence Solution Foundations, Introduction to Security Intelligence Solution SIEM, How Security Intelligence Solution SIEM collects security data, Using the Security Intelligence Solution SIEM dashboard, Investigating an offense that is triggered by events, Investigating the events of an offense, Using asset profiles to investigate offenses, Investigating an offense that is triggered by flows, Using rules and building blocks, Creating Security Intelligence Solution SIEM reports, Perform advanced filtering	[10]
Outcome(s):	Understand the relationship between AI and NLP Know the history and advancement of Computer Vision Understand Computer Vision components Learn about the Vision services that are available from IBM Watson.	
Text Books:	IBM Study Material.	
Reference Books:		

CS 18.214	Developing IoT based Applications	Total Lectures: 40
		Credit: 3-1-0-4
Prerequisite(s):		
Objective(s):	An introduction the idea of collaborative devices working together to achieve a larger goal is not new. Beginning from the simple operational definition, the session will outline the historical perspective right from pre-internet era, specific machine-to-machine communication context aware computing to wearables. It will conclude architecture of Internet of Things (IoT).	
1.	**Unpacking Internet of Things**: What is IoT,Why IoT,Journey of IoT, Business Use cases of IoT, Brainstorming on various IoT use cases on any two Domains like- (Manufacturing , Buildings , Agriculture , Energy & Utilities , Worker Safety),Available programming languages for IoT enabled applications,Basic commands and board configurations,Integration IoT on Arduino.	[5]
2.	**Introduction to basic hardware interfaces and proteus simulation:** Describe a development platform, Describe the architecture of a development platform, Introduction to sensor and hardware (LED, ultrasonic Sensor, Flame sensor, DHT sensor, LCD etc.), Introduction and installation of proteus, Introduction to LED, Writing of LED blinking program on Arduino IDE with hardware implementation,Introduction to seven segment display and its working,Introduction to LCD and describing how digital display works, Writing code for LCD to display sensors results,Descriptive explanation of analog and digital conversion in electronics,Descriptive explanation of Pulse Width Modulation in electronics	[9]
3.	**Introduction to various sensors and their interface with Arduino:** Introduction to ultrasonic sensor and describing how ultrasonic sensors works, Writing code for ultrasonic sensor and display result in Serial Monitor,Introduction to Flame sensor and describing how Flame works, Writing code for Flame sensor to calculate ppm value and display result in Serial Monitor,Introduction to DHT sensor and describing how DHT sensors works, Writing code for DHT and display result in Serial Monitor,Introduction to LDR and describing how it works, writing code it,Introduction, to IR and describing how it works, Writing code for it,Introduction to LM35 and its application	[9]
4.	**Advanced Modules Interfacing And Assignments:** Introduction to Bluetooth and describing how Bluetooth works, Writing code for HOME AUTOMATION,Introduction to GSM and introduction to AT commands, write a code to call/message other phone using AT commands through arduino,write code to upload temperature sensor value on Cloud ,Introduction to Wi-Fi and new modules avail in the market, Write some code on ARDUINO for ESP8266 to upload sensors value on web,Introduction to Acc. describing how it works, Writing code for it	[9]
5.	**ASSIGNMENTS:** Displaying text on LCD ,Scrolling text on LCD,Displaying numbers on LCD ,IOT based agricultural field monitoring and controlling,IOT Based office home security with auto capture on intruder and sending alert,IOT based digital notice board for college ,IOT based contactless liquid level monitoring with empty and full alert ,IoT based home automation with fault switch,IoT based agricultural field monitoring and controlling, Project discussion.	[8]
Outcome(s):	• Unpacking Internet of Things • Getting introduced to IoT • Business Use cases of IoT • Embed various sensors with iot platform and simulate them on virtual simulation software proteus • Creating account on iot cloud platform and setting up communication between arduino and cloud platform.	
Text Books:	IBM Study Material.	
Reference Books:		

CS 17.302 **Advanced RDBMS** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): Database Management System

Objective(s): To acquire fundamental knowledge of Software designing using UML.

1.	Overview of DB2 9 on Linux, UNIX and Windows, Command Line Processor (CLP) and GUI usage, The DB2 environment.	[12]
2.	Creating databases and data placement, Creating database objects, Moving data.	[10]
3.	Backup and recovery, Locking and concurrency, Investigating DB2 locking.	[10]
4.	Problem determination, Application issues and performance, Application performance tools, Security.	[8]

Outcome(s): After completion of this course student get the understandings of advance concepts of Database design and security.

Text Books: **1.** RamezElmasri, Shamkant B. Navathe, "Fundamentals of Database Systems",Pearson Education, 7th Edition, 2015.

2. AviSilberschatz , Henry F. Korth and S. Sudarshan, "Database System Concepts", McGraw-Hill, 6th Edition, 2011.

Reference Books: **1**. Jeffrey A. Hoffer, Mary B. Prescott and Fred R. McFadden, "Modern DatabaseManagement", Prentice Hall, 8th Edition, 2006.

CS 17.208 **Essentials of Software Engineering (OOAD & SW Lifecycle)** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): Object Oriented Technologies

Objective(s):

- To acquire fundamental knowledge of Software designing using UML.

1. **Software Engineering Overview:** Best Practices of Software Engineering Concepts of Object Orientation Essentials of Visual Modeling Requirements Overview [12]
2. **Requirement analysis**: Analysis and Design Overview Architectural Analysis Use-Case Analysis Identify Design Elements [10]
3. **Design analysis**: Identify Design Mechanisms Describe the Run-time Architecture Describe Distribution Use-Case Design Objectstore Mechanism Security Mechanism. [10]
4. **UML and mapping**: UML to C++ Mapping UML to Java Mapping UML to Visual Basic Map UML to Visual Basic Map [8]

Outcome(s):

- After completion of this course student get the understandings of object-oriented analysis and design concepts, as well as hands-on practical experience applying the techniques within a use-case-driven, architecture-centric, and iterative development process.

Text Books:

1. Pressman R.S., "Software Engineering", Tata McGraw Hill Publishing Company Ltd., New Delhi.
2. Sommerville, Ian "Software Engineering", Pearson Education

Reference Books:

1. Jalote Pankaj, "An Integrated Approach to Software Engineering", NAROSA.
2. Fairely, R.E., "Software Engineering Concepts", McGraw-Hill

CS 17. 204 **R Programming** **Total Lectures: 40**
Credit: 3-1-0-4

Prerequisite(s): Programming Language(CS 14.101)

Objective(s):

- To understand and learn programming concepts of R
- To Apply R programming to solve various statistical, graphics and modeling problems

1. **Fundamentals of R** : Evolution of R, Features of R, R environmental Setup, R Script file, Data types- Vectors, Lists, Matrices, Arrays, Factors, Data Frames, Variables, finding and deleting variables, Operators in R. [6]
2. **Control Statements in R**: if-else statement, switch statement, Repeat loop, while loop, for loop, break statement, next statement [8]
3. **Functions, Strings and Vectors :** Function Definition , Function Components Built-in Function, User-defined Function, Calling a Function, Lazy Evaluation of Function, Strings and Strings Manipulation, Vector creation, accessing vector elements, vector manipulation, [10]
4. **Lists, Matrices and Arrays :** List Creation, Naming list elements, Accessing list elements, Manipulating list elements, Merging list, Converting list to Vector, Accessing elements of matrix, matrix computations, Naming row and column of array, accessing array elements, manipulating array elements, calculation across array elements [10]
5. **Data frames, factors and packages:** Extract data from data frame, expand data frames, factors in data frames, changing the order of levels, generating factor levels, packages [6]

Outcome(s): After completing the course the student is expected to

- be able to use and program in the R programming language
- be able to use R programming to solve statistical problems
- be able to apply R Programming concept to solve real world problems

Text Books:

1. Hadley Wickham, Garrett Grolemund, R for Data Science, O'Reilly, January 2017.
2. John Maindonald and John Braun, Data Analysis and Graphics Using R, Cambridge University Press, Cambridge, 2007.

Reference Books:

1. Peter Dalgaard, Introductory Statistics with R, Springer Verlag, 2008.
2. Phil Spector. Data Manipulation with R. Springer, New York, 2008.

CS 17. 254 **R Programming Laboratory** **Credit: 0-0-2-1**

Prerequisite(s): CS14.111(Programming Language Laboratory)

Objective(s):

- To learn R programming constructs
- To learn use R for statistical analysis
- To learn R for modeling.

Contents: Lab manual based upon the theory course CS 17.204 and to achieve the listed course objectives and outcomes.

Outcome(s): On successful completion of this course, the students will be able to

- Write programs using R programming
- Use R programming for statistical analysis of data
- Use R programming for data visualization
- Use r programming for problem modeling

CS 17.101 Software Foundation and programming with C

Total Lectures: 40
Credit:3-0-0-3

Prerequisite(s): CProgramming, FundamentalofComputers

Objective(s): Tounderstandtheadvancedconceptofcprogrammingtosolve therealworldprogramming problems.

1. **PointersinC**:Pointers,declaringpointervariables,dereferencingandaddressofoperators, pointerexpressionandpointerarithmetic,nullpointers,genericpointers,passingarguments to function using pointers, pointers and array, handling multidimensional array using pointers,passing anarray toafunction,pointersand strings,arrayofpointers, pointer-to-pointer,function pointers, dynamic memoryallocationfunctions-malloc(), calloc(), realloc (), free(), drawbacks ofpointers-memoryleak, danglingpointer, memorycorruption [9]
2. **FileHandlinginC**:Streams-stdin,stdoutandstderr,typesoffiles-textfileandbinaryfile, file pointer,file modes-r,w,a,rb,wband ab, filehandlingfunctions-fopen(), fclose(),fscanf( ), fread(), fgetc(), fgets(), fprintf( ),fputc(),fputs(), fwrite(),ferror( ),feof(),fseek( ), ftell( ),rewind( ),fgetpos(), fsetpos(),remove(), rename () [5]
3. **SearchingandSorting-**Searchingtechniques-linearsearch,binarysearch,hashing,sorting techniques-bubblesort, insertionsort,selectionsort, quick sort,mergesort,heapsort,shell sort, radixsort, bucketsort [6]
4. **Stack,QueueandLinkedList**:Introductiontodatastructures,linearandnon-lineardata structures,stack,push and popoperations on stack, applicationofstacks,queue,circular queue,priority queue,deque,insertionanddeletion operations inqueue, linkedlist, single linkedlist,circular linkedlist, double linked list, insertion, deletion andsearching inlinked list, application of linked lists [12]
5. **TreesandGraphs:**Binarytree,Binarysearchtree,AVLtree,Red-Blacktree,Splaytree, B+ tree, insertion , deletion and searching operations on trees, graph terminologies, operations ofgraphs [8

Outcome(s): Upon successfulcompletion ofthe course ,studentswillbe ableto
-solve complex programmingproblems usingthe conceptsofpointers
-handle variousfile operations inc forrealworld applications
-implementvarious data structures usingc language

Text Books: BrainW.Kernighanand DennisM. Ritchie,The C ProgrammingLanguage, Second edition, Pearson Education,2013
D. Samantha, Classic DataStructures, Second edition,PHIlearning, 2013

Reference Books:

K.N.King, CProgramming :AModern Approach , Second edition,W.W. Norton & Company, 2008
Stephan Prata,CPrimerPlus, Fifthedition ,Sams publishing, 2004

Advance Object Oriented Programming

Course code: **CS17.102** **TotalLectures:40**
Credit:3-0-0-3

Unit1–Basic Concepts: core object concepts (Encapsulation, Abstraction, Polymorphism, Classes, Messages Association,Interfaces), Concept of inheritance.Derived class and based class.[3]

Unit2–CoreJava: managing memory with garbage collector,abstraction,accessspecifiers,Collection framework, keywords (static, final, abstract etc.),SwingAPI [9]

Unit3–Java Database Connectivity(JDBC):accessingdatafrom tables:Joining, manipulating Databases with JDBC, Prepared Statements, Transaction Processing, [4]

Unit4–Modeling&Practice:UML diagrams (structural& behavioral),ERdiagrams, DataFlow Diagrams (DFD), logicalcomplexity, effective modularization.Case study:automationtools,agile testingstrategy, agilesprints [6]

Unit5–
Servlets: Servlet Overview and Architecture, Interface Servlet and the Servlet Life Cycle, Handling HTTP get Requests, Handling HTTP post Requests, Redirecting Requests to Other Resources, using cookies [6]

Unit6–JavaServerPages (JSP): Introduction, Java Server Pages Overview, A First JavaServerPage Example,ImplicitObjects, Scripting, StandardActions,Directives,CustomTag Libraries [7]

Unit7–Introduction to Application Development: Introduction to android platform, Creating application template, addingactivity,intent, services to application, usingGoogle mapAPI [5]

CS 16.104 **Programming Language-C++** **TotalLectures:40**
Credit:3-0-0-3

Prerequisite(s): CProgrammingand Fundamentals ofComputers

Objective(s): Tofamiliarizethestudentswith basicconceptsofobject oriented programminganddeveloper tools.
Topresentthe syntaxandsemanticsof theC++ Programming

1. **Object OrientedProgramming:** Basic concepts of object–oriented programming, Structured versusobject- oriented programming, merits and demerits of object oriented methodology — 6
2. **Beginning With C++:** Preprocessor directives, Variables, data types, constants, operators,scoperesolution operator, memory management operators,decision and loop controls,arrays,strings,functions. — 6
3. **Classes And Objects:** Class definition, Structure versus class, accessing member functionswithinaclass,datahiding,arrayswithinaclass,staticdataandmember functions, objects, friend functions and friend classes, constant member functions, pointerstomembers,constructorsand destructor — 8
4. **OverloadingandExceptionHandling:**Definition,unaryoperatoroverloading,binary operators overloading,overloadingofnewanddelete operators, manipulationof string usingoperators,type conversion, overloadingwith friendfunctions,function overloading, error and exception handling — 8
5. **InheritanceandOverriding:**Derivedandbaseclasses,typeofinheritance,derivedclass constructors anddestructor, overridingmemberfunctions,public andprivate inheritance,virtual base classes,abstractclasses,thispointer,virtual functionsand pure virtual functions, staticand dynamicbindings — 8
6. **I/O StreamsandTheStandardLibrary:**Header files, I/O streamlibrary, stream I/O forobjects,FileI/O — 4

Outcome(s): At theendofcourse,studentshaveagoodunderstandingabouttheconceptofobject-oriented programmingusingC++andableto writeandread C++codefor real worldapplications

Chemistry Cycle: Group II – ECE+EE+ME+MBA (Tech.)-CSE/ECE

MA-14.101 **Mathematics-I** **Total Lectures: 40**
3-1-0-4

Objective: To acquire fundamental knowledge of Mathematics and apply in engineering disciplines.

1. **Calculus:** Review of basic concepts, partial differentiation, Euler's theorem on homogeneous functions, Taylor's series and Jacobian, maxima and minima of functions of two variables, asymptotes, tracing of simple Cartesian curves, length of plane curves, area bounded by the curves, multiple integrals (double and triple integrals, change of order of integration), physical interpretations and applications. [16]
2. **Three-dimensional Geometry:** Direction cosines and direction ratios of a straight line, equation of a plane, plane passing through intersections of two planes, equations of straight line, shortest distance between two skew lines, equation of a sphere, intersection of plane and sphere. [10]
3. **Matrix Theory**: Rank of matrix, linear dependence and independence of vectors, solution of system of simultaneous linear equations, Eigen values, Eigen vectors of a matrix, statement of Cayley-Hamilton theorem (without proof) , reduction of a matrix to diagonal form, quadratic forms, linear transformation of a quadratic form, and applications. [10]
4. **Theory of Equations**: Introduction of polynomials, relation between roots and coefficients, Cardon's method. [4]

Outcome: After completion of the course, students would be able to apply mathematical knowledge in engineering and solve curriculum problems.

MA-14.102 **Mathematics-II** **Total Lectures: 40**
3-1-0-4

Objective: To acquire fundamental knowledge of Mathematics and apply in engineering disciplines.

1. **Computational Methods:** Introduction and importance of numerical analysis, calculus of finite differences, interpolation schemes for equal and unequal intervals (Newton's forward and backward interpolation formulae), divided difference, interpolation for unequal intervals (Newton's divided difference and Lagrange interpolation formulae), Solution of algebraic and transcendental equations by Newton-Raphson method. Applications to Engineering. [13]
2. **Ordinary Differential Equations:** First order and first degree differential equations (variable separable, homogeneous, linear, exact equations. Linear differential equations of second order with constant and variable coefficients (complementary functions and particular integrals), and applications. [12]
3. **Partial Differential Equations:** Formation of partial differential equations, Lagrange's multipliers method for solution of first order differential equations, separation of variables for nonlinear differential equations and applications. [5]
4. **Vector calculus:** Vector and scalar point functions, conservative fields, gradient of scalar point functions, divergence and curl of vector point functions (Solenoidal and irrotational vectors), directional derivative of scalar point functions, work done along a curve, Integration of vectors, line integral (work done), surface integral, volume integral, physical interpretations and applications. [10]

Outcome: After completion of the course, students would be able to apply mathematical knowledge in engineering and solve curriculum problems.

PY-14.101 **Engineering Physics** **Total Lectures: 40**

3-0-0-3

Objective: To make a bridge between the physics in school and engineering courses.

1. **Modern Physics**: Introduction to Black body radiation spectrum, Photo-electric effect, Compton effect. Wave particle Dualism. de Broglie hypothesis – de Broglie wavelength, extension to electron particle. Davisson and Germer Experiment. [8]
   Matter waves and their Characteristic properties, Phase velocity, group velocity and Particle velocity, Relation between phase velocity and group velocity, Relation between group velocity and particle velocity. Expression for deBroglie wavelength using group velocity.
2. **Quantum Mechanics:** Heisenberg's uncertainity principle and its physical significance. Application of uncertainty principle (Non-existence of electron in the nucleus, explanation for decay and kinetic energy of electron in an atom). Wave function, Properties and physical significance of wave function, Probability density and Normalization of wave function. Setting up of one dimensional time independent Schrodinger wave equation. Eigen values and Eigen functions. Application of Schrodinger wave equation – Energy Eigen values for a free particle. Energy Eigen values and Eigen functions for a particle in a potential well of infinite depth. [7]
3. **Electrical Conductivity in Metals**: Free–electron concept. Classical free-electron theory – Assumptions. Drift velocity, Mean collision time and mean free path. Relaxation time. Expression for drift velocity. Expression for electrical conductivity in metals. Effect of impurity and temperature on electrical resistivity of metals. [8]
   Quantum free-electron theory – Assumptions. Fermi – Dirac Statistics. Fermi-energy, Fermi factor. Density of states (No Derivation). Expression for electrical resistivity / conductivity. Temperature dependence of resistivity of metals. electron in a periodic potential, origin of the energy gap, band theory of solids, distinction of solids into metals, semi-conductors and insulators.
4. **Dielectric & Magnetic Properties of Materials**: Dielectric constant and polarization of dielectric materials. Types of polarization. Equation for internal field in liquids and solids (one dimensional). Ferro and Piezo electricity. Frequency dependence of dielectric constant. Important applications of dielectric materials. Classification of dia, para and ferro-magnetic materials. Hysterisis in ferromagnetic materials. Soft and Hard magnetic materials. Applications. [7]
5. **Lasers and Optical Fibers**: Einstein's coefficients (expression for energy density). Requisites of a Laser system. Condition for laser action. Principle, Construction and working of CO2 laser and semiconductor Laser. Applications of Laser – Laser welding, cutting and drilling. [10]
   Measurement of atmospheric pollutants. Holography–Principle of Recording and reconstruction of images, applications of holography.
   Propagation mechanism in optical fibers. Angle of acceptance. Numerical aperture. Types of optical fibers and modes of propagation. Attenuation. Applications–Block diagram discussion of point to point communication.

Outcome: The student will be able to understand many modern devices and technologies based on lasers and optical fibers. Student can also appreciate various material properties which are used in engineering applications and devices.

Text Books: S. O. Pillai, "Solid State Physics", Sixth Edition, New Age International
V. Rajendran, "Engineering Physics," TMH

Reference Book: G. K. Shivkumar, "Engineering Physics," Prism Book Pvt. Ltd.

CY-14.101 **Engineering Chemistry** **Total Lectures: 40**
3-0-0-3

Objectives:
1. To purify the most valuable natural resource of the future-water.
2. To understand one of the most versatile Engineering Materials: Polymers their preparation, properties and uses.
3. To develop the basics of protecting engineering materials from the natural forces.
4. To understand the present day up-to-date knowledge of the contemporary energy sources.
5. To build up the basis of the future Engineering materials like superconductors, conducting organic polymers, Nano materials etc.

1. **Water treatment:** Hardness, types of hardness, Determination of hardness by complexometric (EDTA) method, Degree of hardness, Boiler troubles: corrosion, sludge and scale formation, Prevention of sludge and scale formation in boilers. Methods of Boiler Water Treatment: Lime-Soda process, Permutit (Zeolite) process, ion exchange methods. Numerical problems based on water treatment (Lime-Soda process). [10]
2. **Organic and Inorganic Polymers:** Classification, Functionality, Types of polymerization, Mechanism of Addition polymerization. Plastics: thermoplastic and thermosetting resins. Preparation, Properties and Uses of Polyamides, Bakelite, Polyesters, Rubber, Vulcanization of Rubber, Synthetic Rubber viz. Buna-S, Buna-N, Butyl and Neoprene rubbers. Silicones-polysiloxanes and sulphur based polymers. [8]
3. **Electrochemistry and Corrosion:** Electrochemical Changes, Electrochemical cell and its classifications (Galvanic cell, electrolytic cell) Types of electrodes (Reference electrodes-Standard Hydrogen Electrode, Indicator electrodes- Glass Electrode), Origin of electrode potential, Nernst equation of electrode potential. Electromotive force, Electrochemical Series. Corrosion: Definition and its significance, Theories of corrosion, Mechanism of corrosion, types of corrosion, Galvanic cell, and concentration cell, Water line corrosion, Pitting & Stress corrosion (Caustic embrittlement), Protection against corrosion, Corrosion control (Corrosion inhibitors, Cathodic protection - sacrificial anodic and impressed current cathodic protection), protective metallic coatings. [10]
4. **Fuels:** Classifications of fuels, Comparison of solid, liquid & solid fuels, Calorific value of a fuel. Bomb calorimeter, Determination of LCV & HCV, Petroleum: origin, composition, processing, cracking, synthetic petrol, refining, reforming, knocking, unleaded petrol, LPG as a gaseous fuel. Numerical problems based on combustion. [6]
5. **New Engineering Materials:** Introduction: Superconductors, high and low temperature superconductors, organic electronic materials, Fullerenes and Nano materials, Industrial applications of fullerenes and Nano materials. [6]

Outcomes: The student will be able to understand the basis of the future Engineering materials like of superconductors, conducting polymers, Nano materials etc and purification of the most valuable natural resource of the future-water.

Text Books:
Jain and Jain, "Engineering Chemistry," 15th Edition, 2006, Dhanpat Rai Publishing Company.
S.S. Dara, "A Text Book of Engineering Chemistry," 9th Edition, 2001, S. Chand & Company Limited.

Reference Books:
Atkins, "Physical Chemistry," 7th edition P.W.

J.F. Shakelford, M.K.Murlidhara, "Materials Science for Engineers," 6th Edition.
Bokris and Reddy, "Modern Electrochemistry I," 2nd Edition, Springer.

ME-14.101 **Applied Mechanics** **Total Lectures: 40**
3-1-0-4

Objectives:
1. This course will help the student to acquire knowledge of basic engineering mechanics concepts and enhance their ability to solve open ended engineering problems.
2. To provide the student with a clear and thorough understanding of the theory and applications of engineering mechanics, covering both statics and dynamics.
3. To provide the student with a thorough understanding of the concept, drawing, and the use of free-body diagrams.
4. To be able to determine the Centre of Gravity and Moments of Inertia
5. of simple geometric shapes and understand the physical applications of these properties.
6. To understand the use and be able to perform calculations related to friction forces in engineering applications.

1.	**Introduction:** Idealization of Mechanics, concept of Rigid Body, External Forces (Body forces & surface forces), Laws of Mechanics.	[3]
2.	**Force Systems and Equilibrium:** Introduction to vector, Statically Equivalent Force systems, Free Body Diagram, Equations of equilibrium and their applications to various system of forces.	[8]
3.	**Distributed Forces and Moment Of Inertia:** Centroid of Composite figures, Area Moment of Inertia, Mass Moment of Inertia, Principle axes and Principle Moment of Inertia.	[5]
4.	**Friction:** Introduction of friction, Laws of friction, wedge, screw, belt, rolling friction.	[5]
5.	**Tension, Compression and Shear:** Normal stress and strain, Linear elasticity, Hooke's Law and Poisson's Ratio, Shear stress and shear strain, Relationship between modulus.	[4]
6.	**Beams:** Different support & load conditions, SFD, BMD	[5]
7.	**Kinematics of Particles:** Introduction, Rectilinear motion, Plane curvilinear motion**,** Rectangular coordinates, Tangential and normal coordinates, polar coordinates, Relative motion (Translating Axes), constrained motion of connected particles.	[5]
8.	**Kinetics of Particles:** Introduction, Force, Mass and acceleration, Newton's second law of motion, Equation of motion and solution of problems, Work and Energy, Impulse and Momentum.	[5]

Outcome: The students shall develop the ability to identify, formulate, and solve engineering problems related to forces and motion.

Text Books: Timoshenko, S, Young, D.H, Rao, J.V, "Engineering Mechanics," 4th edition TMH, 2010.
Merian, J.L, Kraige, L.G., "Engineering Mechanics Vol I & II," 5th edition Wiley India 2010.

Reference Books: Hibbeler, Gupta R. C., "Engineering Mechanics," 11th ed.,Pearson India, 2010.

Irving. H. Shames, "Engineering Mechanics," Prentice Hall Book Company, 1966.

EE-14.101 **Elements of Electrical Engineering** **Total Lectures: 40**
3-1-0-4

Objective: This course facilitates the students to get a comprehensive exposure to various concepts and devices of electrical engineering.

1. **Introduction:** Background, major inventions, scope, significance and job opportunities in electrical engineering, brief overview of various energy resources. Apparatus used in generation, transmission and distribution of electrical power and various industries. [3]
2. **D.C. circuits:** Review of circuit elements, voltage sources, current sources, ohms law, KVL, KCL, source transformation, mesh current and node voltage analysis of circuits. [5]
3. **Network Theorems:** Superposition theorem, Thevenin's theorem, Norton's theorem, Maximum Power Transfer theorem, star-delta transformation. [6]
4. **Single phase A.C. circuits:** Basic terminologies, average & rms values of a.c. quantities, phasor representation, response of R, L, C and their combination to a.c. excitation, concept of power and power factor in a.c. circuits. [6]
5. **Three phase A.C. circuits:** Three phase supply, phase sequence, star connection, delta connection, relationship between phase and line quantities in 3-phase circuits, measurements of three phase power under balanced condition. [6]
6. **Magnetic Circuits & Transformer:** Magnetic circuit, mutually coupled circuit, Transformer: working principle, emf equation, ideal & practical transformer, Equivalent circuits, Transformer testing: open circuit and short circuit test, losses, voltage regulation and efficiency. [8]
7. **Rotating Machines**: Electro-mechanical energy conversion, introduction to rotating machines and applications. [6]

Outcome: The students shall develop an insightful knowledge on various fundamental elements and devices of electrical engineering.

Text Books: Nagrath & Kothari, "Theory and problems of Basic Electrical Engineering," 2nd edition PHI Publication.
Fitzgerald & Kingsley, "Basic electrical Engineering," 3rd edition TMH publication.

Reference Books: H.Cotton, "Advanced Electrical Technology," CBS Publication.

Vincent Del Toro, "Electrical Engineering Fundamentals," 2nd Edition PHI Publication.

EC-14.101 **Basics of Electronics Engineering** **Total Lectures: 40**

3-1-0-4

Objective: This course would facilitate the learner to acquire good exposure to electronics and communication engineering.

1. **Introduction**: Brief history of major inventions, scope, significance and job opportunities in electronics and communication engineering, Overview of various specializations in ECE, Electronic test and measurement equipments, Specifications for electronic components. [3]
2. **Semiconductors**: Material and its properties, Formation of energy band diagram, Currents in semiconductors, Fermi-Dirac energy distribution, Types of semiconductors – Intrinsic and Extrinsic, Mass action law, Hall effect. [5]
3. **Diodes**: Introduction, Characteristic of ideal and real diode, Current components in diode, load characteristics, Breakdown in diode, Zener diode, Varactor diode, Tunnel diode, Clippers and Clampers, Rectifiers – Half and Full-wave rectifiers. [8]
4. **Transistors:** Introduction to pnp and npn transistors, current components, active, cutoff and saturation regions, CC, CB and CE configuration, Operating point, Biasing circuits, Bias Stability, Thermal runway and thermal stability. [8]
5. **Signals**: Definition, Classification of signals – Analog and Digital, Deterministic and Random signals, Power and Energy of signals, Bandwidth, Bit and Baud rate. [4]
6. **Basics of Communication**: Definition, Block representation of communication system, Modulation – Definition, Need of modulation, Frequency translation, Types of modulation - Analog and Digital, Multiplexing – TDM and FDM. [6]
7. **Applications of Communication**: Introduction to - Optical Fiber, Transmission line, Waveguides, Satellite communication and RADAR. [6]

Outcome: The learners are expected to have an overview of electronics and communication engineering and learn the introductory concepts in each of the specializations in ECE.

Text Books: George Kennedy, Bernard Davis, "Electronics Communication Systems", 3rd Edition, Tata McGraw-Hill, 2007.
Behrouz Forouzan, "Data Communication and Networking", 4th Edition, McGraw-Hill, 2006.
Robert L. Boylestad, Louis Nashelsky, "Electronics Devices and Circuits Theory", 10th Edition, Prentice Hall, 2009.

Reference Books: David A. Bell, "Electronics Devices and Circuits", PHI, 4th edition, 2008.
Wayne, Tomasi, "Advanced Electronic Communication Systems", 6th edition, PHI, 2013.

CS-14.101 **Programming Language** **Total Lectures: 40**
3-1-0-4

Objectives: Learning principle to program by a structured native language 'C'. Students will comprehend the rudiments, constructs, syntax and statements with essentials of efficient compiling, running and debugging processes.

1. **Introduction: T**he role of programming languages, programming paradigms, language description and syntax structure. Basics of structured programming, object oriented programming, functional programming, logic programming, concurrent programming. [10]
2. **Fundamentals of 'C' language :** Character set, Variables data types constants, arithmetic , relational and logical operators, type conversion , increment , decrement ,Bitwise and assignment operators, conditional expressions, statements and blocks, if-else , switch, Loops-Do-While , while, for; break, continue and Go to statements, Labels. [10]
3. **Functions, pointers and Arrays:** Basics of functions, automatic, external, static and register variables, scope rules and header files, recursion and C preprocessor, arrays, pointers and addresses, pointers and arrays address arithmetic, character pointers and functions, pointer arrays, pointers to functions, pointers and multidimensional arrays, command line arguments**.** [10]
4. **Structures, unions and file processing:** Basics of structures, structures and functions, arrays of structures, pointers to structures, self referential structures, unions, Bit fields, Concept of files, Standard Input and Output, formatted output, file access in different modes, reading from and writing into a file. [10]

Outcome: Students would be able to apply learning and knowledge of C language analytically, critically and logically to solve mathematical, scientific and real life problems in efficient manner.

Text Books: Brain W. Kernighan and Dennis M. Ritchie, "The C Programming Language," Second edition 2013, Pearson Education
Ravi Sethi & K.V.Viswanatha, "Programming Languages –Concepts and Constructs," Second edition 2013, Pearson Education

Reference Books: Herbert Schildt**, "**C: The Complete Reference," Fourth edition, McGraw-Hill Education, 2000

E Balagurusamy, "Programming in ANSI C," Tata McGraw - Hill Education

ME-14.111 **Computer Aided Engineering Drawing** **0-0-4-2**

Objective:
1. To improve the visualization skills.
2. To enable the students with various concepts like dimensioning, conventions and standards related to working drawings in order to become professionally efficient.
3. To impart the knowledge on understanding and drawing of simple engineering products.

1. **Introduction to Computer Aided Sketching:** Introduction, Drawing Instruments and their uses, BIS conventions, Lettering, Dimensioning and free hand practice. Board Drawing vs. Computer- Aided Drawing. Introduction to Solid works Environments. [8]
   Computer screen, layout of the software, standard tool bar/menus and description of most commonly used tool bars, navigational tools. Co-ordinate system and reference planes. Definitions of HP, VP, RPP &LPP. Creation of 2D/3D environment. Selection of drawing size and scale. Commands and creation of Lines, Co-ordinate points, axes, dimensioning, line conventions, material conventions and lettering.
2. **Orthographic Projections** : Horizontal planes, Vertical planes, Front view, Top view, Side view, Projections, First and Third angle of projection, Projections of points, Principles of orthographic projections, Sketching of different views of given objects. Introduction to sketching in Solid works : 2-Dimenional Sketching, Sketching in Solid works, poly-lines, square, rectangle, polygons, splines, circles, ellipse, text, move, copy, off-set, mirror, rotate, trim, extend, break, chamfer, fillet, curves, constraints viz. tangency, parallelism, inclination and perpendicularity. [12]
3. **Projections of Lines, Planes, Solids:** Lines inclined to both the principal planes, projection of Lamina inclined to both principal planes, Projections of solids: Axis inclined to both the reference planes and Intersection of solids. Introduction to part module in Solid works: Extrude, Revolve, Sweep, Hole, Filleting, and Chamfering features. [12]
4. **Sections of solids and sectional orthographic views:** Sectional orthographic projections - Full, Half, Partial, revolved and removed surfaces. Introduction to drawing module in Solid works: Standard 3 views, Auxiliary view, Section View, Projected view. [12]
5. **Isometric Projection:** Terminology, Isometric scale, Box method, Coordinate or offset method, Four-center method, isometric projection of arcs. Solid models practice using Solidworks part module. [8]

Outcomes:
1. Students will be able to improve their visualization skills so that they can apply these skills in developing new products.
2. Students will be able to know and understand the conventions and the methods of engineering drawing using Solid works.
3. Students will be able to prepare simple drawings of engineering products.

CS-14.111 **Programming Lab** **0-0-2-1**

1. **C- Language Basics**
    - 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.

2. **Control Statements**
    - 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.

3. **Functions**
    - 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.
4. **Arrays**
    - 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.
5. **Pointers**
    - 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.

6. **Structure and Union**
    - 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.
7. **I/O and File Structure**
    - 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.

PY-14.111 **Physics Lab** **0-0-2-1**

1. To study of material constant, temperature coefficient of current and planck's constant.

2. To determine the specific resistance of a given wire by using the Carey Foster's bridge

3. (a) To determine the ballistic constant, K of a moving coil ballistic galvanometer with a standard capacitor of known capacity.
(b) To determine the high resistance by the method of leakage of a condenser with the help of ballistic galvanometer.

4. To measures the wavelength of He-Ne laser beam with a Ruler or vernier calliper.

5. (a) To convert a galvanometer into a voltmeter of a given range.
(b) To convert a galvanometer into an ammeter of a given ranges.

6. To plot graph showing the variation of magnetic field with distance along the axis of a circular coil carrying current and to estimate from it the radius of the coil.

CY-14.111 **Chemistry Lab** **0-0-2-1**

1. To determine the Total, Temporary and permanent hardness of water by EDTA method.
2. To determine the % of available chlorine in a sample bleaching powder.
3. To determine the alkalinity of given water sample.
4. To prepare urea formaldehyde resin.
5. To determine the Calorific value of a fuel by bomb calorimeter.
6. Determination of the strength of HCl by titrating it against NaOH pH metrically.
7. Determination of the strength of HCl by titrating it against NaOH conductometrically.

ME-14.112 **Mechanical Workshop** **0-0-2-1**

List of Jobs:

1. Fitting Shop: Prepare job that contain various fitting operation like filing, marking, measuring, cutting, drilling etc.

2. Carpentry Shop: Making of carpentry joint (T, L joint etc).

3. Sheet Metal Shop: Making job from sheet (funnel, tray etc).

4. Machine Shop: Perform various operations like, turning, step turning, facing, chamfering, knurling etc on Lathe.

Text Books: Hajara Chaudhary, Workshop Technology vol I & II, Media Promoters and Publishers PVT. LTD, Mumbai.
B.S. Raghuvanshi, Workshop Technology, Dhanpat Rai & Sons. New Delhi.

Reference Books: H S Bawa, Workshop Technology, TMH. New Delhi.

EE-14.111 **EEE Lab** **0-0-2-1**

Practical to be performed on Hardware:

1. Introduction to basic electronics components and study of breadboard, CRO, function generator, multimeter and D.C. power supply.
2. To plot VI characteristics of junction diode and zener diode.
3. To design a half wave rectifier with and without filter circuit and find the ripple factor.
4. To design a full wave rectifier with and without filter circuitand find the ripple factor.
5. Study of clipper and clamper circuits and implement on breadboard.
6. To perform soldering and de-soldering to make banana probe, BNC probe and connection on PCB.
7. To conduct open circuit test and short circuit test on single phase transformer and to determine equivalent circuit parameters.
8. Measurement of three phase power by using two wattmeter methods.
9. Speed control of DC machine by field current control method.
10. To construct a fluorescent tube wiring and to measure voltage across tube rod, voltage across choke and current.

Practical to be performed using Multi-Sim Software:

1. An Introduction to Electronic Circuit Simulation using **Multi-Sim Software**.
2. To verify Ohm's law and Kirchhoff's law.
3. Simulate half wave and full wave bridge rectifier.
4. To plot VI characteristics of junction diode.

B. Tech. Electronics & Communication Engineering

Four Year B. Tech. Programme

Academic Curriculum (2016 - 17 onwards)

Common to B.Tech (ECE), MBA (ECE), BTMT (ECE – SP & VLSI base)

Second Year

CS -14.203 **Data Structures** **Total Lectures: 40**

Credit : 3-0-0-3

Prerequisite(s): CS-14.101, CS-14.111

Objective(s): To provide knowledge of ways of structuring and operating on data, the nature of some fundamental problems, methods for addressing those problems, and to promote an analytical and empirical appreciation of the behavior of algorithms using data structures.

1. **Introduction:** Basic Terminology, Elementary Data Organization, Algorithm, Efficiency of an Algorithm, Time and Space Complexity, Asymptotic Notations, Time-Space Trade- Off, Abstract Data Types. **[4]**
2. **Array:** Definition, Single and Multidimensional Arrays, Representation of Arrays: Row Major Order, and Column Major Order, Application of Arrays, Sparse Matrices and Their Representations. **[4]**
3. **Searching & Sorting:** Sequential Search, Binary Search, Comparison and Analysis, Hash Function, Collision Resolution Strategies, Insertion Sort, Selection Sort, Bubble Sort, Quick Sort, Merge Sort, Heap Sort, Radix Sort. **[6]**
4. **Linked list:** Singly Linked Lists, Doubly Linked List, Circular Linked List, Insertion, Deletion, Traversal, Polynomial Representation and Addition, Generalized Linked List. **[6]**
5. **Stack:** Primitive Stack Operations: Push and Pop Array and Linked List Implementation of Stack, Application of Stack: Prefix and Postfix Expressions, Evaluation of Postfix Expression, Recursion, Tower of Hanoi Problem. **[4]**
6. **Queue:** Queue Operations, Circular Queues, Array and Linked List Implementation of Queues, Dequeue and Priority Queue. **[4]**
7. **Tree:** Binary Trees, Binary Tree Representation, Tree Traversal Algorithms: Inorder, Preorder and Postorder, Threaded Binary Trees, Huffman Algorithm, Binary Search Trees AVL Trees. **[6]**
8. **Graph:** Terminology, Sequential and Linked Representations of Graphs: Adjacency Matrices, Adjacency List, Adjacency Multi List, Graph Traversal: Depth First Search and Breadth First Search, Spanning Trees. **[6]**

Outcome(s): Upon completion of the course the student should

- be knowledgeable of certain abstract data types (ADT).
- be able to make a critical assessment of different implementations of an ADT.
- be familiar with a number of fundamental computational problems, and be aware of real world instances of those problems.

Text Books:

2. Horowitz and Sahani, Fundamentals of Data Structures, Galgotia Publication, 1999.
3. Jean Paul Trembley and Paul G. Sorenson, An Introduction to Data Structures with applications, McGraw Hill, 2nd Edition, 2003.
4. G. A. V. Pai, Data Structures and Algorithms, TMH, 2008.

EC-14.201 **Electronic Devices and Circuits** **Total Lectures: 40**
3-1-0-4

Objective To acquire fundamental knowledge of operation, design and application of various Electronic devices and circuits.

Prerequisite Basic Electronics and Physics of electron.

1. **Junction Diode:** Junction breakdown**,** Current components in a p-n diode, Quantitative analysis of p-n diode characteristics and equivalent circuit, diode resistance, interconnections of diodes, transition and diffusion capacitance. [6]

2. **Transistors**: Operation of transistor, transistor current components, transistor circuit configurations, transistor biasing schemes and operating point stabilization, hybrid-pi model of BJT, low and high frequency models of JFET, MOS Devices - NMOS, PMOS and CMOS [11]

3. **Small Signal Amplifiers at Low Frequency:** Coupling schemes for multistage amplifiers, frequency response of coupled amplifier, RC coupled transistor amplifier, transformer coupled transistor amplifier, cascode circuits, Differential amplifier, Darlington amplifier. [7]

4. **Power Amplifiers:** Power amplifier circuits, class-A, class-B, class-AB, class-C, push pull amplifiers- class-A, class-B, Class- AB, complementary symmetry push-pull and quasi-complementary symmetry, push-pull amplifiers. [8]

5. **Oscillators:** Classification criterion for oscillation, tuned collector, Hartley, Colpitts, RC phase shift, Wien bridge and crystal oscillators, astable, monostable and bistable multivibrators, Schmitt trigger [8]

Outcome: After completion of this course, students would be able to understand the working phenomena and applications of various electronic devices and circuits. Knowledge gained from this course would also be utilized to design different electronic circuits and devices.

Text Books:
1. Millman J. & Halkias C.C., "Electronic Devices and Circuits" McGraw Hill.
2. Thomas L. Floyd, "Electronic Devices", Pearson Education.
3. Robert L. Boylestad & Louis Nashelsky, "Electronic Devices and Circuit Theory", Pearson Education.

Reference Book: Bell, David A., "Operational Amplifiers & Linear ICS" Prentice Hall of India.

EC-14.203 **Digital Electronics** **Total Lectures: 40**
3-1-0-4

Objective: The aim of this course is to present the principles and techniques of combinational and sequential digital logic design and optimization at a gate level. The use of transistors for building gates is also introduced.

Pre-requisite: Basic Electronics course in First Year.

1 **Number Systems and Codes:** Introduction to number systems, weighted and non-weighted codes, 1's complement, 2's complement, complement arithmetic. [2]

2 **Introduction to Boolean Algebra:** Postulates and theorems of Boolean algebra, Boolean functions, canonical and standard form, simplification of Boolean function using Boolean laws and theorems. [2]

3 **Logic Gates:** Diode and transistor as a switch, basic logic gates, derived logic gates, block diagrams and truth tables, logic diagrams from Boolean expression and vice versa, converting logic diagram to universal logic, positive logic, negative logic and mixed logic. [5]

4 **Simplification of Boolean Functions:** K-map representation, incompletely specified functions, simplification realization with gates, Quine-McCluskey method. [5]

5 **Combinational Logic:** Analysis and design of combinational circuits, half adder and full adder, half subtractor and full subtractor, binary serial and parallel adder, BCD adder, binary multipliers, magnitude comparator, decoders, encoders, multiplexers, de-multiplexers. [10]

6 **Sequential Circuits:** Latches, flip-flops, triggering of the flip-flops, master-slave flip-flop, excitation tables, conversion of the flip-flops, analysis and design of clocked sequential circuits, shift registers, counters. [10]

7 **Logic Families:** Logic gate characteristics (propagation delay, speed, noise margin, fan-in, fan-out, power dissipation), standard logic families (RTL, DCTL, TTL, ECL, MOS) [5]

8 **Programmable Logic:** Introduction to programmable logic array (PLA), programmable array logic (PAL). [1]

Outcome: Graduates will have knowledge of digital systems. They will understand how to analyze and design digital logic circuits, and be familiar with digital ICs.

3. Jain, R. P., “Modern Digital Electronics”, Tata McGraw-Hill, Patel Nagar, New Delhi, 4th Ed.

EE-14.201 Network Analysis & Synthesis Total Lectures: 40
3-1-0-4

Objective: This course helps in analysis of A.C & D.C circuits and it also help to design the circuit models for the minor and major projects.

Prerequisite: Knowledge of Laplace transformation

1. **Development of Circuit Concept:** Introduction, capacitance, inductance and resistance parameters, approximation of a physical system as a circuit, reference directions for current and voltage, voltage and current sources, active element conventions, dot convention for coupled circuits, topological description of networks, linear graphs of a network and its parts, loops and trees, incidence matrix, cut-set matrix and tie-set matrix. [8]
2. **Network Equations**: Kirchhoff's laws, minimum number of network equations, source transformations, formulation of network equations, loop variable analysis & node variable analysis and duality. [6]
3. **Analysis of RLC Circuits**: Laplace transformation, some basic theorems for the Laplace transformation, transient response of RL, RC and RLC circuits using Laplace transform with D.C input and A.C. with sinusoidal input, partial fraction expansion, solution of problems by Laplace transformation. [8]
4. **Network Theorems**: Superposition and reciprocity theorems, Thevenin's and Norton's theorems, Millman's theorem, Tellegen's theorem, and maximum power transfer theorem, application of these theorems to networks with a.c and d.c excitation. [8]
5. **Two Port Network**: Two port parameters, impedance, admittance, hybrid, inverse hybrid, transmission parameters, relationship between various parameters, reciprocity and symmetry of two port network, inter connection of two port networks. [6]
6. **Synthesis of Passive Network**: Hurwitz polynomials, positive real functions, elementary synthesis procedures, properties of LC immittance function, synthesis of LC driving point immittance, properties of RC driving point impedances, synthesis of RC impedances or RL admittances, properties of RL impedances and RC admittances, synthesis of RLC functions. [6]

Course outcome: Upon successful completion of this course, students should be able to:

1. Gain fundamental knowledge of the basic electrical elements such as resistance, capacitors and inductances.
2. Understand circuit representation as graphs and implementation of KVL and KCL in the circuits and to solve the circuit problems by Laplace transformation method and also by applying various networks theorems.
3. Analyze small RLC circuits by hand. Use network techniques, like node analysis and loop analysis, to write equations for large linear circuits.
4. Apply Thevenin and Norton theorems and concept of linearity and superposition to analyze and design circuits and networks.

Text Books

3. A. Sudhakar and S. P. Shyam Mohan, "Circuits and Network Analysis and Synthesis", Tata McGraw-Hill, 2007.
4. W. H. Hyatt Jr. and J. E. Kemmerly, "Engineering Circuits Analysis", McGraw-Hill.

MA 14.201 **Applied Mathematics** **Total Lecture: 40**
3-1-0-4

Objective: To acquire fundamental knowledge of linear programming, numerical methods, complex analysis and integral transform and apply in engineering disciplines.

1. Linear Programming: Introduction**,** Graphical method (bounded & unbounded solutions); Simplex method, Artificial variable technique (Two phase method, Big –M method); Assignment problem (Hungarian method); Transportation problem (Vogel's approximation method). **[12]**

2. Numerical Methods: Solution of system of equations (Gauss elimination and Gauss - Seidel methods); Solution of algebraic and transcendental equations (Bisection, Ramanujan's and Regula Falsi methods); Solution of ordinary differential equation (Euler's modified, Milne's predictor & corrector Runge-Kutta methods). **[10]**

3. Complex Analysis: Function of complex variable, analytic function, Cauchy- Riemann equations(without proof), integration of complex functions, line integrals in the complex plane, Cauchy integral theorem(without proof), Cauchy integral formula(without proof), zeros and singularities of complex functions, residues. **[06]**

4. Integral Transform: Laplace transform and inverse Laplace transform First and Second Shifting theorems, Convolution theorem (without proof), Solution of ordinary differential equations with initial conditions by Laplace transforms. Fourier series of periodic functions, even and odd functions, Fourier half-range series; Basics of Fourier transforms. **[12]**

Outcome: After completion of the course, students would be able to apply the knowledge of linear programming , numerical methods ,complex analysis and integral transforms in engineering
and solve curriculum problems.

EC-14.221 Electronics Devices and Circuit Laboratory 0-0-2-1

Objective To acquire fundamental knowledge of operation, design and application of various Electronic devices and circuits by doing the experiments.

Prerequisite Electronic Workshop

1. To plot the diode characteristics and its dynamic resistance and cut-in Voltage.
2. Plot the characteristics of a Zener diode and find its dynamic resistance under reverse biased condition. Plot the Line-Regulation and Load-Regulation curve using Zener diode.
3. (a) To implement a diode clipper circuit which clips the positive peak of the input voltage (i) By 1V and (ii) By 3V. (For given sinusoidal input $V_{pp} = 4V, 1kH$).
   (b) To implement a diode clipper circuit which clips the negative peak of the input voltage (i)By 1.5V and (ii)By 2.5V.(For given sinusoidal input $V_{pp} = 4V, 1kH$).
4. (a) To implement a diode clamper circuit which clamps the positive peak of the input voltage to(i)zero reference voltage and (ii)a given voltage $1V$. (For given square wave input $V_{pp} = 10V, 1kH$).
   (b) To implement a diode clamper circuit which clamps the negative peak of the input voltage to(i)zero reference voltage and (ii)a given voltage 1.5V.(For given square wave input $V_{pp} = 10V, 1kH$.
5. To plot the frequency response of a emitter follower.(For given sinusoidal input $V_{pp} = 3V, 1kH$.
6. Design a Half Wave Rectifier circuit with and without capacitor filter, measure the rms and Dc values of output voltage and calculate the ripple factor for given sinusoidal input $V_{pp} = 10V, 1kH$.
7. To plot the input and output characteristics of a transistor in CE Configuration.
8. Design a two stage RC coupled transistor amplifier and calculate the gain.(for given sinusoidal input $V_{pp} = 200mV, 1kHz$).
9. To plot the characteristics of a UJT and find its peak voltage, peak current and valley voltage. Design a relaxation oscillator determine the frequency of oscillation and compare the practical frequency obtained with the theoretical frequency.
10. To plot the Transfer characteristics (for$V_{DS} = 5V$)and Drain (for $V_{GS} = -1V$) characteristics of a JFET in CS Configuration.

Outcome:

After completion of this lab course, students would be able to demonstrate the working phenomena and applications of various electronic devices and circuits. Knowledge gained from this course would also be utilized to design different electronic circuits and devices.

Reference Book: Lab Manual and supported books referred in theory.

EC-14.223 **Digital Electronics Laboratory** **0-0-2-1**

Objective: This lab course develops skills for implementing and analyzing digital electronic circuits, with applications to electronics design. It is also designed to enhance problem solving ability through steadily increasing problem complexity.

Pre-requisite: Digital Electronics (EC 14.203)

1 To study the use of General Purpose Digital Trainer and familiarization with the digital IC Data-Books.

2 To study AND, OR. NOT, NAND, NOR, EX-OR gates and their specified experiments.

3 To set up a 4-bit Binary Counter (74LS93) to demonstrate its sequence of Counting.

4 To study the characteristics curve of TTL and CMOS logic gates.

5 To design and test 4-bit Adder and Subtractor circuits.

6 To compare the magnitude of two 4-bit Binary Numbers A and B.

7 Design a combinational circuit with 4 inputs and 4-outputs that converts a 4-bit Gray Code to an equivalent 4-bit Binary number.

8 Design and implement a BCD to Seven Segment Decoder / Driver.

9 To design and implement a 2 to 1 multiplexer.

10 To design and implement a 1:2 & 1:4 de multiplexer.

11 To investigate the operation of various flip flops SR, JK, T and D using gates and FF ICs.

12 To study the following application of shift register using IC 74LS164 and 74LS194 (Shift Right Logic, Shift Left Logic, Parallel Load).

13 Design and test arithmetic and logic circuit using combinational circuit (logic circuit, multiplexer and 4-bit binary adder/ full adder. (Already covered in experiment no.6, 10 &11)

14 Design and test a 4-bit Up Down binary counter. (Already covered in experiment no.3)

Outcome:

1. The background provided in this laboratory may effectively be utilized for the understanding of advanced courses such as VLSI Design and for the designing of complex circuitry.
2. Gain a hands-on experience in carrying out key operations needed to assemble circuits on breadboard.
3. This subject is directly applicable to industrial IC design and provides a strong background for more advanced courses.
4. This lab will be useful in the designing of hardware projects.

Reference Books:

1. Krishnamurthy, K. A., "Digital Lab Primer", Pearson Education, Patparganj, Delhi, First Indian Print, 2003.

2. TTL ICs Data Book

EE-14.221 Network Analysis & Synthesis Laboratory 0-0-2-1

Objective This Lab course helps us to gain basic knowledge of principle, operation, application and design/verification of various Electrical components /devices/ circuits/theorems by conducting the experiments.

Prerequisite EEE Workshop

1. To study the series and parallel connected resistive circuits.

2 To study the equivalent star of a delta connected resistive circuit and also the equivalent delta of a star connected resistive circuit.

3. To verify the Kirchhoff's current Law and Kirchhoff's Voltage law.

4 To verify the superposition theorem using resistive circuit.

5. To verify the Reciprocity Theorem using resistive circuit.

6. To verify the Thevenin's Theorem using resistive circuit
7. To verify of Norton's Theorem using resistive circuit.
8. To verify of Maximum Power Transfer Theorem using resistive circuit.
9. To determine Z-parameter, Y-parameter and ABCD parameter of a given Two-port network
10 To design a zero PCB for a given circuit to verify the Thevenin's Theorem
11 To find out the time- constant of RL-series circuit when connected to step function.
12 To find out the time constant of RC-series circuit when connected to step function.

Outcome:

After completion of this lab course, students would be able to demonstrate the working phenomena and applications of various electrical components and circuits. Knowledge gained from this course would also be utilized in designing different electrical circuits/theorems and devices.

EC-14.202 Microprocessor Programming and Interfacing Total Lectures: 40
3-0-0-3

Objective: To develop an in-depth understanding of the operation of microprocessors and microcontrollers, machine language programming & interfacing techniques.

Pre-requisite: The students should have good background on digital circuits (should have attended the course Switching Circuits and Logic Design).

1. **The Microcomputer:** Evolution of microprocessor, address bus and data bus, introduction to machine language and assembly language, logic devices for interfacing: 74244, 74245, 74373 **[3]**
2. **The 8085 Processor:** Architecture, pin diagram and description of various signals, read, write and op-code fetch cycles, interrupt structure, instruction set and Assembly language programming. [12]
3. **The 8086 Microprocessor Architecture :** Architecture, details of sub-blocks such as EU, BIU; memory segmentation and physical address computations, pin diagram and description of various signals, minimum and maximum mode of operations, supporting chips viz. 8284, 8288 and memory mapping [8]
4. **Programming of 8086:** Addressing modes of 8086, instruction set of 8086, assembly language programming, counters and time delays, stack structure of 8086 and subroutine. [7]
5. **Interfacing of 8085 / 8086 with Programmable Chips:** Interfacing of 8255 Programmable peripheral interface, 8251 USART, 8253/8254 Programmable Interval Timer and Direct Memory Access Controller 8237/8257 DMA, 8259 Programmable Interrupt Controller. [10]

Outcome: **Upon completion of this course, the student will be able to:**

1. The student will learn the internal organization of some popular microprocessors and microcontrollers.
2. The student will learn hardware and software interaction and integration.
3. The students will learn the design of microprocessors/microcontrollers-based systems.

Text Books:

1. Ramesh S. Gaonkar, Microprocessor Architecture, Programming and Application with the 8085; Penram International Publishing (India).
2. A. K. Ray & K. M. Bhurchandi, Advanced Microprocessors and Peripherals; TMH.

EC-14.204 **Integrated Circuit and Applications** **Total Lectures: 40**

3-1-0-4

Objective: To acquire fundamental knowledge of Mathematics and apply in engineering disciplines.

Pre-requisite: EC-14.201(Electronics Devices and Circuits)

1. **Differential Amplifier:** Operational amplifier, bipolar and FET differential amplifiers, constant current source, current mirror, level translator, block diagram of operational amplifier, frequency response and stability, operational amplifier parameters, offset compensation techniques. **[6]**
2. **Application of Op-amp:** Inverting and non-inverting amplifiers, voltage follower, integrator and differentiator circuits, instrumentation amplifier, current to voltage converter and voltage to current converter, voltage to frequency conversion, analog simulation of differential equations using operational amplifiers. **[7]**
3. **Oscillators:** Phase shift, Wein bridge, quadrature, square wave, triangular wave, sawtooth wave and voltage controlled oscillator. **[5]**
4. **Active Filters:** Low pass, high pass, band pass and band reject filters, designing of second order filters using Butterworth approximations, higher order filters and state variable filters. **[6]**
5. **ICs and Applications:** Clipping and clamping circuits, comparator, LM-311 comparator, schmitt trigger, log and antilog amplifiers, half and full wave rectification, IC-8038, IC LF-398, IC-555. **[6]**
6. **Voltage Regulator and PLL:** Voltage regulator IC-723, switching regulators, regulator IC series 78xx, 79xx, building blocks of PLL, IC-565 and its applications, four-quadrant multiplier and its applications. **[10]**

Outcome: After completion of the course, students would be able to apply mathematical knowledge in engineering and solve curriculum problems.

Text Books:

1. Gayakwad R. A., "Op-Amps and Linear Integrated Circuits", PHI, New Delhi, 3rd Edition.
2. Singh B. P. and Singh Rekha, "Electronic Devices and Integrated Circuits", Pearson Education, Patparganj, Delhi.
3. Coughlin R. F. and Driscoll F. F., "Operational Amplifiers & Integrated Circuits", Pearson Education, Patparganj, Delhi.

Reference Books:

1. Franco S., "Design with Operational Amplifiers and Analog Integrated Circuits", Pearson Education, Patparganj, Delhi.

EC-14.206 **Consumer Electronics** **Total Lectures: 40**

3-1-0-4

Objective: This subject will introduce the students with working principles, block diagram and advance features of consumer electronics appliances. Also this will familiarize students with latest advancements in Electronic manufacturing industry. Knowledge so gained would also help in troubleshooting and maintaining different electronic gadgets and appliances.

Pre-requisite: Basic understanding of electric circuits and components and some knowledge of basic electronic devices such as diodes, transistors etc.

1. **Introduction to Electronics Engineering:** Review of basic electrical & electronic circuits and components. Difference in electrical and electronic engineering. Introduction to electronics industry in India and the world; consumer electronics gadgets classification and applications. Introduction to ESDM (Electronic System Design & Manufacturing). **[4]**
2. **Audio devices and systems:** Characteristics of sound signal: level and loudness, pitch, frequency response, fidelity and linearity, Reverberation. Audio level metering, decibel level in acoustic measurement. Microphone: working principle, sensitivity, response. Loud speaker: working principle, characteristic impedance, and watt capacity, loud speaker types. Sound recording: Optical recording, stereophony. Audio system: CD player, home theatre sound system. Digital console: block diagram, working principle, applications. FM tuner: concepts of digital tuning, ICs used in FM tuner TDA 7021T. PA system: planning, speaker impedance matching, Characteristics, power amplifier. **[12]**
3. **Television and Video Systems:** Monochrome TV standards, scanning process, aspect ratio, persistence of vision and flicker, picture resolution. Composite video signal: horizontal and vertical sync details. Colour TV standards, colour theory, hue, brightness, saturation, luminance and chrominance. PAL system, channel bandwidth. Digital TVs: - LCD, LED, PLASMA, HDTV, 3-D TV, projection TV, DTH receiver. CD and DVD player: working principles. **[10]**
4. **Home and Office Appliances:** FAX and Photocopier Microwave Oven: types, technical specifications Washing Machine: wiring diagram, electronic controller for washing machine, technical specifications, types of washing machine, fuzzy logic Air conditioner and Refrigerators: Components features, applications and technical specification. Digital camera and cam coder. **[10]**
5. **Advanced trends in Electronic manufacturing industry:** Basics of semiconductor technology and integrated circuits. Introduction to embedded intelligence in electronic gadgets: microcontroller based systems; different ICs used in the systems such as 8051, Op-Amp, 555 timer, and Digital ICs. **[4]**

Outcome: After the completion of the course, students are able to acquire required learning outcomes in cognitive, psychomotor and affective domains to demonstrate the following course outcomes:

i. Troubleshoot different types of microphones, audio systems and colour TV receiver.
ii. Maintain various electronic home appliances.

Text Books:

1. Audio video systems : principle practices & troubleshooting ; Bali R. and Bali S.P. ; Khanna Book Publishing Co. (P) Ltd. , 2010
2. Consumer Electronics; S.P. Bali ; Pearson Education India, 2010
3. Audio video systems ; Gupta R. G. ; Tata Mc Graw Hill, New Delhi, 2010
4. Colour Television & Video Technology; A. K. Maini ; CSB Publishers

Reference Books:

1. Modern Television Practices ; Gulati R. R. ; New Age International Publication, New Delhi, 2010
2. Standard Handbook on Audio Engineering ; Whitaker Jerry & Benson Blair ; McGraw Hill Professional ; 2010
3. VCR-principles, maintenance & repair by S.P. Sharma, Tata Mc Graw Hill, New Delhi

EC-14.208 **Principles of Electromagnetics** Total Lectures: 40

3-0-0-3

Objective: To develop the understanding of basics concepts of electromagnetic field theory and its applications.

Pre-requisite: Basic understanding of laws of Physics and Mathematics

1. **Introduction**: Transformation of a point and a vector in different coordinate systems, Differential length, area, volume Physical meaning of gradient, divergence and curl, Laplacian of a scalar, Divergence theorem, Stoke's theorem, review of electrostatic and magneto static fields. [8]
2. **Time Varying Fields and Maxwell's Equations:** Faraday's law of electromagnetic induction, Maxwell's equations in integral and differential form, potential functions, electromagnetic boundary conditions. [8]
3. **Electromagnetic Waves:** Introduction, Helmholtz wave equation, Wave equations and their solutions for free space, lossy dielectric, Lossless dielectrics and good conductor medium, Poynting vector and the flow of power. Reflection of plane wave at dielectric media and conducting surfaces for normal incidence. [10]
4. **Transmission lines:** Types of transmission lines, transmission line parameters, two conductor transmission line equations, input impedance, standing wave ratio and power of transmission lines, smith chart, transmission line impedance matching techniques. [6]
5. **Guiding Structures:** General wave behaviors along uniform guiding structure, rectangular and circular wave guides, wave propagation in rectangular and cylindrical cavity resonators. [8]

Outcome: After completion of this course, students would be understanding the concept of electric and magnetic fields, both static and dynamic, and gain insight in various application areas like transmission lines and waveguides.

Text Books:

1 Matthew N. O. Sadiku, Principles of Electromagnetics (Fourth Edition); Oxford University Press.

2 William H. Hayt: Engineering Electromagnetic, TMH.

3 Raju, Electromagnetic field theory and Transmission lines, Pearson Education.

4 John D. Kraus: Electromagnetics, McGraw Hill.

Reference Books:

1 David J. Griffiths, Introduction to Electrodynamics (Third Edition); Pearson Education.

2 M. L. Sisodia and G. S. Raghuvanshi, Microwave Circuits and Passive Devices, New Age Publication.

MA 14.202 **Statistics and Probability Theory** **3-1-0-4**

Total Lecture: 40

Prerequisite: Basic Mathematics

Objective: To acquire fundamental knowledge of Statistics and Probability and apply in engineering disciplines.

1 Introductory Ideas: Recapitulation of Basic Probability theory; Law of addition and law of multiplication ;conditional probability; total probability; Bayes' theorem and it's applications. [06]

2 Random Variables and Distribution: Discrete and continuous random variables; types of distribution; probability mass and density functions; mean, variance and standard deviation of distribution. [04]

3 Theoretical Probability Distribution: Discrete types (Binomial) and Continuous type (Normal,Students'); applications of basic ideas to these distributions. [08]

4 Sampling Theory: Sampling distribution of mean and variance; central limit Theorem. [04]

5 Testing of Hypothesis: Simple and Composite hypothesis; Type I and Type II errors; tests of significance and level of significance. [04]

6 Correlation and Regression: Simple, partial and multiple correlations; linear regression. [06]

7 Queuing Theory and Queuing Models: Birth and death process; pure birth and pure death process; Classification of queuing models: M/M/1, M/M/1/N, M/M/S and M/M/S/N. [08]

Outcome: After completion of the course, students would be able to apply the knowledge of Statistics and Probability in engineering and solve curriculum problems.

Text Books:

1. A.P.Baisnab and Manoranjan Jas, Elements of Probability and Statistics, 2003, TMH.
2. Pugalararasu, Probability and Queuing Theory, TMH.
3. Gupta & Kapoor, Fundamental of Mathematical Statistics, SCS Publisher, June 2002.
4. Gupta & Kapoor, Fundamental of Applied statistics, SCS Publisher, Jan 2001.
5. B.V. Ramana, Higher Engineering Mathematics, TMH, 2006.

Reference Books:

1. Papoulis, Probability, Random Variables and Stochastic Processes, TMH.
2. Palaniammal, Probability and Random Processes, PHI.
3. Spiegel, Probability and Statistics (Schaum's outline Series), TMH.
4. Miller and Freund's, Mathematical Statistics with Applications, 7e, Pearson.
5. Richard A. Jonson, Probability and Statistics for Engineers, Pearson.

EC-14.222 Microprocessors Programming and Interfacing Laboratory 0-0-2-1

Objective: To introduce to students the basics of 8086 microprocessor, assembling language programming and interfacing with various modules.

Pre-requisite:

In this laboratory the students are expected to learn to apply their theoretical knowledge of both the hardware and software aspects of microprocessors. Programming of the device is done in assembly language. Some of the experiments that follow the construction project deal with software while others deal with the problems of interfacing of microprocessors.

1 [a] Write a program for 8085 microprocessor to move a eight bit number in register A, B, C and D. Verify the content of all the registers after execution of program.
Also find out the followings:

(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

[b] Load a eight bit number stored in memory location 4000H into register A. Now load the content of A in B and in memory location 5000H. Verify the contents of A, B and memory location 5000H.

Also find out the followings:

(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

2 Write a assembly language program to add two eight bit numbers stored in memory and store the 8 LSBs and 8 MSBs of sixteen bit result at 2000H and 2001 respectively. Verify the content of flag register after addition.
Also find out the followings:

(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

3 [a] Write a program to perform multiplication of two 8 bit numbers using 8085 microprocessor.
Also find out the followings:

(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

[b] Let two numbers are stored at memory locations 2000H and 2001H. Write a program for 8085 microprocessor to perform following actions:
If 1^{st} number > 2^{nd} number then store 00H at 3000
If 1^{st} number < 2^{nd} number then store FFH at 3000
If 1^{st} number = 2^{nd} number then store 99H at 3000
Also find out the followings:

(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

4 [a] Write a program for 8086 microprocessor to transfer a series of five eight bit number stored from

memory location 2000:2000 to new memory location 3000: 3000.

Also find out the followings:

(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

[b] Write a program for 8086 microprocessor to transfer a series of five sixteen bit number stored from memory location 2000:2000 to new memory location 3000: 3000.

Also find out the followings:

(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

5 **[a]** Write an assembly language program for 8086 microprocessor to find out the smallest number from a series of five eight bit numbers and store it at memory location 2000H: 2000H.

Also find out the followings:

(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

[b] Write an assembly language program for 8086 microprocessor to find out the largest number from a series of five eight bit numbers and store it at memory location 2000H: 2000H.

Also find out the followings:

(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

6 Create a look-up table from memory location 2000H: 1000H to store square of numbers from 00 to 09. Write an assembly language program for 8086 microprocessor to find out the square of a number stored at 2000H: 100AH and store the result at 2000H: 100BH.

Also find out the followings:

(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

7 **[a]** Write a program to arrange the series of four eight bit numbers in ascending order.

Also find out the followings:

(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

[b] Write a program to arrange the series of four eight bit numbers in descending order.

Also find out the followings:

(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

8 Interface three LEDs with 8086 Kit to form traffic light control logic.

Also find out the followings:

(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

9 Interface a buzzer with 8086 microprocessor with the help of relay and write a program to control the ON-OFF sound from the buzzer. Also find out the followings:

(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

10 Interface a DC motor with 8086 microprocessor and write a program to control its operation.

Also find out the followings:

(i) Total number of bytes required for the program
(ii) Hex code of each instruction used in the program

Laboratory Assignment: Assembly and Machine Language Programming, Signal Generators, Interfacing Basic I/O devices like Keypad, LED display, Usage of Timers & USART Peripherals.

Outcome: **After the basic knowledge of microprocessor and microcontroller interfacing and their applications, the student will be able to:**

- Analyze and apply working of 8086.
- Compare the various interface techniques. Analyze and apply the working of 8255, 8279, 8259, 8251, 8257 ICs and design and develop the programs.
- Learning the Communication Standards.

EC-14.224 Integrated Circuit & Applications Laboratory 0-0-2-1

Objective: This lab course develops skills for implementing and analyzing electronic circuits, with applications to electronics design. It is also designed to enhance problem solving ability through steadily increasing problem complexity.

Pre-requisite: Integrated Circuits & Applications (EC 14.204)

Experiments to be performed on breadboard

1. To measure the following parameters of IC-741-
(a) Slew rate (b) CMRR

2. Implement the circuits to show the application of op-amp as-
(a) Summing amplifier (inverting)
(b) Difference amplifier (c) Algebraic adder

3. (a) Design an ideal inverting integrator to integrate a square wave of frequency, f ≥ 1KHz.
(b) Design a non-ideal non-inverting differentiator to differentiate a triangular wave of frequency, f ≥ 1KHz.

4. To plot the frequency response of -
(a) 1st order Low-Pass active filter
(b) 1st order High-Pass active filter

5. Design a second order band pass filter with cut off frequencies 200Hz and 1kHz and a gain of 4db. Plot its frequency response and hence find the Q of this filter.

6. Design the following circuit using IC 555 timer-
(a) Monostable Multivibrator to generate a pulse of 0.11 ms.
(b) Astable Multivibrator with 50% duty cycle.

7. Design op-amp based circuits to realize Wein Bridge oscillator.

8. To study application of IC 555 as-
(a) VCO (b) Schmitt-trigger circuit for square wave generator

9. To measure free running frequency, lock range and capture range of the given PLL circuit using IC-565.

10. Verify the line regulation and load regulation using IC 723.

Experiments to be performed on MultiSim software

1. Design and verify the operation of non-inverting amplifier.

2. Design an ideal inverting differentiator to differentiate a triangular wave of frequency, f ≥ 1KHz.

3. Design a non–ideal inverting integrator to integrate a square wave of frequency, f ≥ 1KHz.

4. Design Op-amp based circuits to realize Phase Shift Oscillator.

5. Implementation of Bistable Multivibrator using 555 timer.

6. To determine the frequency and output amplitude of a triangular wave generator.

Outcomes:

1. Gain a hands-on experience in carrying out key operations needed to assemble circuits on breadboard.
2. This subject is directly applicable to industrial IC design and provides a strong background for more advanced courses.
3. This lab will be useful in the designing of hardware projects.

Reference Book: Gayakwad R. A., "Op-Amps and Linear Integrated Circuits", PHI, New Delhi, 3rd Edition.

EC-14.210 **Comprehensive I** **Total Lectures: 40**
0-0-0-3

Objective To acquire intensive knowledge and proficiency in some special field of knowledge.

Prerequisite Basic concepts of all prior program related courses such as, principles of semiconducting materials and devices, digital logic systems and theories of circuits and networks.

1. Comparative study of BJT and MOS transistors in respect of operation, circuit configuration, biasing stability, high and low frequency models, small-signal amplifiers and oscillator design issues.
2. Boolean function implementation using logic gates, comparative studies of RTL, DTL, TTL and ECL logic families in respect of speed, noise and power dissipation, logic function design based on PLA and PAL.
3. Application of Laplace transformation to network equations, steady-state and transient response of low-pass, high-pass and band-pass networks, hybrid and transmission parameters of two-port networks, RL, RC, and RLC network synthesis.

Outcome: After completion of this course, students would be able to understand the principles of entire field of major subjects till the second year of study.

CS-14.202

Java Programming

Total Lectures: 40

Credit : 3-0-0-3

Prerequisites: CS14.101, CS-14.205.

Objectives: The objective of this Course is to:

- Cover issues related to the definition, creation and usage of classes, objects and methods. Become comfortable with object-oriented programming and learn to think in terms of objects.
- Discuss the principles of inheritance and polymorphism. The concepts would be demonstrated through problem analysis assignments.
- Provide the foundation of good programming skills by discussing key issues of the design of object-oriented software, including programming design patterns and documentation.
- Cover the basics of APIs as well as allow students to explore the Java Abstract Programming Interface.

5. **Overview:** Introductionto java, importance of Java, interactive development environments: Eclipse/Net Beans, basics of OOP. **[4]**
6. **Data Types, Variable, and Arrays:** primitive data types, type casting,arrays, operators and control structures. Identifiers, constants and literals. **[6]**
7. **Classes and Objects:** Class fundamentals, declaring objects, assigning object referencevariables, introducing methods, constructors, the this keyword, garbage collection, the finalize() method, overloading methods, using objects as parameters and return type, introducing access control, understanding static, introducing final, introducing nested and inner classes, exploring the string class, using command-line arguments. **[9]**
8. **Inheritance:** Inheritance basics, using super, multilevel hierarchy, constructor in hierarchy, method overriding, dynamic method dispatch, using abstract classes, using final in inheritance, the object class. **[4]**
9. **Package, Interfaces and Exception Handling:** Packages, access protection, importing packages, interfaces, exception-handling fundamentals, exception types, using try and catch, multiple catch clauses, nested try statements, throw, throws, finally, Java's built-in exceptions, user defined exception. **[6]**
10. **Multithreaded Programming:** The Java thread model, the main thread, creating multiple threads, thread priorities, managing threads, Thread class built-in functions **[4]**
11. **I/O and String Handling:** I/O basics, reading console input, writingconsole output, the Print Writer class, reading and writing files, string constructors, operations on String, String tokenizing, String Buffer **[7]**

Outcomes: Upon completion of this course, students are able to:

- Understand the concepts of OOP as well as the purpose and usage principles of inheritance, polymorphism, encapsulation and method overloading.
- Identify classes, objects, members of a class and the relationships among them needed for a specific problem.
- Develop programs using the in-built Java API and the Java standard class library.
- Create Java application programs using sound OOP

practices(e.g.,interfacesandAPIs)and proper program structuring (e.g., by using access control identifies, automatic documentation through comments, error exception handling).

- Use of development environment like Eclipse for collaborative programming/editing.

Text Books:

1. Java The Complete Reference, 8th Edition. By Herbert Schildt.
2. Mastering Java 2 By John Jukowski.

Reference Books:

1. Think Java "How to Think Like a Computer Scientist", By Allen B. Downey.
2. Java How To Program (Early Objects), 10th Edition, ByPaul Deitel,Harvey Deitel.

EC-14.301 **Signal Processing and Applications** **Total Lectures: 40**

3 – 1 – 0 - 4

Objective:

- To understand the fundamental characteristics of continuous- and discrete-time signals and systems in terms of both the time and transform domains and to develop the mathematical skills to solve problems involving convolution and sampling.
- The students would be familiar with different methods in DSP, including digital filter design, transform-domain processing and importance of Signal Processors. The course emphasizes intuitive understanding and practical implementations of the theoretical concepts.

Pre-requisite: None

1. **Representation and classification of Signals**: Signal classification - Continuous and discrete time, Periodic - aperiodic, even - odd, energy - power, Deterministic - random, real valued - complex exponential, sinusoidal, time scaling, time shifting, Sampling and discrete time processing of continuous-time signals, Concept of frequency in continuous-time and discrete-time signals. **[06]**
2. **Basics of Systems and Transformation**: Properties of systems – linearity, time invariant, causal, stable, inverse, static and dynamic, system impulse response, convolution, correlation, Transformation - Fourier series, continuous time and discrete time Fourier transform, Laplace transform, z-transform, its properties, limitations and inverse transforms, pole – zero concept, computation of impulse response and transfer function using transforms. **[06]**
3. **Analysis of Continuous time and discrete time systems:** Block diagram representation, linear time-invariant (LTI) systems, interconnection of LTI Systems, discrete time systems and their types, systems with finite and infinite duration impulse response, recursive and non-recursive structures, system realizations in direct , transpose, cascade and parallel forms. **[08]**
4. **DFT, FFT and DCT Algorithms:** Discrete Fourier transform (DFT), linear convolution using DFT, efficient computation of the DFT - Fast Fourier transform (FFT) algorithms, radix-2 & 4 FFT algorithms, discrete cosine transform (DCT) - DCT-1 and DCT-2, energy compaction property of DCT. **[06]**
5. **Digital Filter Design:** Review of analog filters – comb and notch types, Design of infinite Impulse Response (IIR) filter from analog filters - Bilinear and Impulse invariant transformation, Finite Impulse Response (FIR) filter - amplitude & phase responses, linear phase filters, transversal filters, windowing techniques, comparison between IIR and FIR filters. **[08]**
6. **Applications of signal processing:** DTMF signal detection, spectral analysis of deterministic and random signals, musical sound processing, signal compression and radar application. **[06]**

Outcome: After completion of the course, students will be able to

- Understand the process of sampling and spectral characteristics of periodic and aperiodic signals using Fourier analysis and determine the response of LTI system using Fourier analysis convolution.
- Understand the meaning and implications of the properties of signals and systems, and represent discrete-time signals analytically and visualize them in the time domain.
- Understand the Transform domain and its significance and problems related to computational complexity.
- Design discrete time filters, compute different errors in design process.

Text Books:

1. Signals and Systems - A.V. Oppenheim, A.S. Willsky and S.H. Nawab, PHI, 2nd Edition.
2. Signals and Systems – Tarun Kumar Rawat, Oxford Higher Education, 2010
3. Digital Signal Processing – A Computer Based Approach, S. K. Mitra, 3rd Ed, McGraw-Hill.

4. Principles of Signal Processing and linear systems – B. P. Lathi, Oxford

Reference Books:

1. Fundamentals of Signals and Systems Michel J. Robert, MGH International Edition, 2008.
2. Digital Signal Processing, Principles, Algorithms, and Applications: John G. Proakis, Dimitris G. Manolakis. Pearson Education, PHI - 2007

EC-14.303 **Principles of Analog Communication** **Total Lectures: 40**

3-1-0-4

Objective:

- To develop a fundamental understanding on communication systems with emphasis on analog modulation techniques.
- To appreciate the mathematical concepts that form the foundations of analog communication

Pre-requisite: Signals and Systems, Statistics and Probability Theory

1. **Linear Modulation Techniques:** Basic blocks of communication systems, Review of signals and systems, Linear Modulation, Time domain and frequency domain description of AM (DSB-FC), DSB-SC, SSB and VSB signals. Generation and detection of linear modulation techniques, Super-heterodyne receivers and design. **[12]**
2. **Angular Modulation Techniques:** Basic concepts, Frequency Modulation Spectrum Analysis of FM Wave, Generation and detection of narrow band and wide band frequency modulation, Phase modulation, FM detection techniques-phase locked loops, Commercial broadcasting systems. **[8]**
3. **Sources of Noise and their characterization:** Random Variables, Random process and their characterization. Noise in Analog communication System. SNR calculations for synchronous detection of DSB and SSB and envelope detection of AM, SNR calculations for angle modulation system. Pre-emphasis and de-emphasis. Threshold effect in angle modulation. **[8]**
4. **Multiplexing and Multiple Access Techniques:** Frequency division Multiplexing, time division multiplexing, multiple access techniques. **[5]**
5. **Sampling and Pulse Modulation:** Sampling theorem – ideal and natural sampling and reconstruction, Pulse-Amplitude Modulation, Pulse-Time Modulation. **[7]**

Outcome:

1) Apply the basic knowledge of signals and systems and understand the basics of communication system and analog modulation techniques.
2) Evaluate the communication system performance in the presence of noise and summarize the merits and demerits of all the conventional analog modulation system.
3) Understand the basics of different of multiplexing and multiple access techniques and their application in cellular networks.
4) Understand the fundamentals of digital transmission of analog signals.
5) Design as well as conduct experiments, analyze and interpret the results to provide valid conclusions for modulators, demodulator and communication systems using CAD tool.

Text Books:

EE-14.204 Electrical Measurement and Instrumentation Total Lectures: 40
3-0-0-3

Objective: To make students conversant with concepts of measurement and various electrical and electronics instruments, transducers and bridges.

Pre-requisite: Basic Electrical engineering, Basic Electronics engineering

1 **Concepts of Measurements:** Introduction, accuracy and precision, repeatability, errors in measurement, sources of errors, types of errors, statistical analysis of measurement data, graphical representation of measurement, data as distributions, Gaussian graph and precision indices. [6]

2 **Analog Instruments:** Types of operating torques in an analog instrument, Moving coil, moving iron, electrodynamic and induction instruments-construction, operation, torque equation and errors. Shunts and multipliers. Applications of instruments for measurement of single-phase power and single-phase energy. Errors in wattmeter and energy meter and their compensation and adjustment. [6]

3 **Bridge:** DC bridges for measurement of resistance Wheatstone bridges, Kelvin's double bridges and AC bridges for measurement of L, R, C & M, Maxwell's bridges, Anderson's bridges, Weins bridges. [6]

4 **Electronic Instruments for Measuring Basic Parameters:** Electronic Voltmeter, Electronic Multimeters, Digital Voltmeter, Q meter, Vector Impedance meter, signal analyzers- wave analyzers, harmonic distortion analyzers and spectrum analyzers. [6]

5 **Potentiometers:** DC and AC potentiometers, Principles, Standardization and application. [5]

6 **Transducers:** Introduction , Classification, Selection Criteria, Characteristics, Construction, Working Principles and applications of following Transducers- RTD, Thermocouples, Thermistors, LVDT, RVDT, Strain Gauges, Tachogenerators, Piezoelectric Transducers, Ultrasonic Flow Meters. [6]

7 **Oscilloscopes:** CRT Construction, Basic CRO circuits, CRO Probes, Oscilloscope Techniques of Measurement of frequency, Phase Angle and Time Delay. [5]

Outcome: Students will be able to understand electrical and electronic measuring devices and instrumentation like bridges, transducers, CRO etc.

EC 16.305 **Semiconductor Physics** **Total Lectures: 40**

3-1-0-4

Course Objective

The aim of the course is to develop physics and engineering strategies of semiconductor materials and to discuss their functionalities in modern electronic and optoelectronic devices.

Prerequisites : Basic Modern physics , Optics

1	Introduction to solid state materials - crystal structure - Reciprocal lattice - Brillouin zone and rules for band (*k* - space) representation. Dynamics of electrons in periodic potential: Kronig - Penny and nearly free electron models - Real methods for band structure calculations; Bandgaps in semiconductors - Holes and effective mass concept - Properties of conduction and valance bands.	[8]
2	Fermi distribution and energy - Density of states - Valance and conduction band density of states - intrinsic carrier concentration - intrinsic Fermi level. Extrinsic semiconductors: n and p type doping - Densities of carriers in extrinsic semiconductors and their temperature dependence - extrinsic semiconductor Fermi energy level - Degenerate and non - degenerate semiconductors - Bandgap Engineering.	[8]
3	Scattering Mechanism: electron - electron and electron - phonon scattering. Macroscopic transport: Carrier transport by Diffusion - Carrier transport by Drift: Low field, High field and very high field (Impact ionization) - Einstein relation.	[8]
4	Electron - hole pair generation and recombination: band to band (direct and indirect band gap transitions) and intra band (impurity related) transitions, free - carrier & phonon transitions. Excitons : Origin, electronic levels and properties Radiative and nonradiative recombination (Shockley - Read - Hall and Auger) processes. Carrier transport - continuity equations. Optical constants: Kramers - Kronig relations.	[8]
5	Optical processes in semiconductor, choice of materials for LED, LED power and efficiency, LED structures - Planar LED, Dome LED, Surface Emitting LED, Edge Emitting LED, Optical detection principle, quantum efficiency, Photoconductor, p-n photodiode, p-i-n photodioe, APD, Heterojunction diode, optocouplers.	[8]

Course Outcome

This course will provide the students with a basic understanding of the physics and principles of semiconductor material and the operation of the most important semiconductor devices in modern microelectronics and photonics.

Text Books:

1. "The Physics of Semiconductors" by Kevin F Brennan, Cambridge Univ. Press (1999).
2. "Fundamentals of Semiconductors" by Peter Y Yu and Manuel Cardona, Spriger, (1996).
3. "Introduction to Solid State Physics" by Charles Kittel, 6th Ed., Willey (1991).

Reference Books

4. "Semiconductor Physics and Devices" by D.A. Neamen, 3rd Ed.,Tata McGraw-Hill, (2002).
5. "Physics of Semiconductor Devices" S.M. Sze, John Willey, 2nd Ed., (1981).
6. "Semiconductor Optoelectronics (Physics and Technology)", Jasprit Singh, McGraw-hill, (1995).

EC-14.321 **Digital Signal Processing Lab** **0-0-2-1**

Objective: The lab aims to introduce the mathematical approach to manipulate discrete time signals, which are useful to learn digital tele-communication.

Pre-requisite: Signals and Systems

1. **Using the MATLAB**

i) Generation of the basic signals such as unit impulse, unit step, unit ramp, exponential, sine and cosine etc.
ii) Study of linear convolution
iii) Study of impulse response of the causal LTI System
iv) Study of DFT
v) Study of circular convolution
vi) Study of FIR filter response
vii) Study of IIR filter response
vii) Study of FFT

2. **Using the TMS320C67XX Processor**

i) Wave generation
ii) Linear Convolution
iii) Circular Convolution
iv) DFT
v) Impulse Response of systems

Outcome: Analyze discrete-time systems in both time & transform domain and also through pole-zero placement.
Analyze discrete-time signals and systems using DFT and FFT
Design and implement digital finite impulse response (FIR) filters.
Design and implement digital infinite impulse response (IIR) filters.

\

Text Books:

1. Digital Signal Processing – S. K. Mitra (McGraw-Hill)
2. J. G. Proakisetal, Digital Signal Processing, (4/e) Pearson, 2007.

Reference Books:

1. Signals and Systems-Simon Haykin, Bary Van Veen-Wiley Eastern
2. A.V. Oppenheim & R.W. Schafer, "Discrete Time Signal processing", (2/e), Pearson Education, 2003.

EC-14.323 Analog Communication Laboratory 0-0-2-1

Objective: The educational objectives of the EC-14.323 (Analog Communication Lab)course are:

- Graduates who desire to pursue an engineering career in Communication arena will be widely employed in positions they find appropriate and desirable.
- Graduates who desire to pursue higher degrees will be successful in gaining admission and advancing in programs they find appropriate and desirable.

Pre-requisite: EC-14.206

1. To Generate an AM signal and measure the depth of modulation using a CRO.
2. Implement an AM Modulator and demodulator circuits and verify its waveform and calculate its modulation index.
3. Implement FM generator circuit and observe variation with modulating signal.
4. Implement a circuit of Pulse Width Modulator with IC-555.
5. Implement a circuit of Pulse Width Modulator with IC-741.
6. Implement a circuit to show the application of IC-555 as Pulse Position Modulator.
7. To observe the effect of pre-emphasis and de-emphasis on given input signal.
8. Implement the PLL circuit to find its capture range and lock range.
9. Study of Time Division Multiplexing and demultiplexing (TDM- PAM) (ST 2102)
10. To understand the AM Signal modulation and demodulation. (MULTISIM)
11. To understand double side band AM modulation technique. (MULTISIM)
12. To analyze the modulation index and power of an AM signal. (MULTISIM)
13. To understand the FM Modulation and detection. (MULTISIM)
14. Study of sampling theorem, construction and reconstruction and see the aliasing effect. (ST 2101)
15. Project based on communication techniques

Outcome:

- Ability to apply knowledge of mathematics, basic science, and engineering to solve problems encompassing fundamental areas of Analog Communication.
- Ability to apply in-depth knowledge of Communication principles, systems, and devices to the solution of real time problems.
- Ability to design and evaluate a component or system to meet desired needs within the field of Communication systems.

Text Books:

1. B. P. Lathi, "Modern Digital and Analog communication Systems", Oxford University Press, 2010.
2. P. K. Ghosh, Principles of Analog and Digital Communication, Orient Black Swan Publishers Pvt. Ltd.

Reference Books:

1. Simon Haykin, An Introduction to Analog and Digital Communication; John Wiley & Sons
2. Taub and Schilling, Principles of Communication Systems, TMH

EC 15.311 **Telecommunication Switching Systems** **Total Lectures: 40**

3-0-0-3

Objectives:

1. To acquire knowledge on simple telephone communication and basics of switching system.
2. To get acquainted with electromechanical switching systems.
3. To gain knowledge on digital switching systems, stored program control system, traffic engineering, telephone networks and ISDN.
4. To apply the knowledge of Telecommunication Switching in designing switching systems.

Prerequisite: NONE

1. **Introduction to Switching Systems:** Introduction, simple telephone communication, basics of switching system [4]
2. **Electromechanical Switching Systems: Introduction to Strowger switching system,** Crossbar switching systems, single stage and multistage switching systems, common control, pulse dialling, tone dialling. [6]
3. **Digital Switching Systems:** Stored Program Control, centralised SPC, distributed SPC, software architecture, application software, space division, and time division switching, time multiplexed space division, time multiplexed time division switching and combination switching. [10]
4. **Traffic Engineering:** Erlang's equation, blocking probability and B-D equation. [4]
5. **Telephone Networks:** Subscriber loop, digital subscriber loop, high speed digital transmission over subscriber line, wire-in, wire-less media, coaxial cables, optical fibre cables, microwave propagation, satellite transmission, numbering plan, charging plan, Inchannel signalling, common channel signalling. [10]
6. **ISDN and ATM Standards:** ISDN architecture, channels, interfaces, protocol, B-ISDN architecture, frame relay, ATM protocols [6]

Outcomes: Once the student has successfully completed this course, he/she will be able to answer the following questions or perform following activities:

1. Able to explain the basic concepts of telecommunication Switching Systems.
2. Able to describe different mechanical and electronic switching systems, telephone networks.

Able to design various switching systems.

Text Books:

1. Telecommunication Switching Systems and Networks, Thiagarajan Viswanathan, PHI
2. Telecommunication Switching, Traffic and Networks, J. E. Flood, Pearson Education

EC-15.313	System Design Using HDL	Total Lectures: 40
		3-0-0-3

Objective: To acquire fundamental knowledge of designing of digital systems using VHDL.Students will acquire practical working knowledge of creating digital circuits using commercial Computer-Aided-Design (CAD) tools.

Pre-requisite: Knowledge of digital logic and digital circuits are highly desired.

1. **Programmable Logic Design:** ASIC, ROM, PLA, PAL, CPLD and FPGA. **[3]**

2. **VHDL Based Design:** An overview of VHDL, Role of VHDL in system design, Introduction to CAD tools for system design, Introduction to Xilinx IDE software. **[3]**

3. **VHDL Fundamentals:** Entity and architecture declaration, Introduction to behavioral, dataflow and structural models, package, package declarations and package body. **[6]**

4. **Basic Elements of VHDL:** Data objects – constant, variable and signal, Data types – scalar and composite, Predefined Operators – logical, relational, shift, adding and multiplying, Overloading – literal and operator. **[4]**

5. **VHDL Statements:** Process,variable assignment, signal assignment, sequential statements, conditional statements, loop**,** if, case, next statements, assertion and report statements, signal drivers and signal assignment statements, conditional signal assignments, select and generic. **[10]**
   Subprograms: Application of functions and procedures, Overloading and signal assignments, Component declaration, Component instantiation.

6. **Combinational Circuit Design:** VHDL models of combinational circuits such as Adder, Multiplexer, De-multiplexer, Encoder, Decoder, Code converters, Comparators, Parity generators, Multipliers and implementation of Boolean functions. **[7]**

7. **Sequential Circuit Design:** VHDL Models of sequential such as edge triggered D flip flop, T flip flop and J K flip flop, serial in serial out register, serial in parallel out register, parallel in parallel out register, counter, memory, ALU. **[7]**

Outcome: After completion of the course, students would be able to:

- Identify, formulate, and solve engineering problems
- To use the technique, skills, and modern engineering tools necessary for engineering practice.

Text Books:

1. J. Bhaskar, VHDL Primer, Pearson Education Asia, 3rd Ed.
2. Douglas L. Perry, VHDL Programming by Examples, Tata McGraw Hill, 4th Ed.
3. Yogesh Misra, Digital System Design Using VHDL, Dhanpat Rai & Co., 1st Ed.

EC 15.315 **BASICS OF ROBOTICS** **Credit : 3-0-0-3**
Total Lectures: 40

• To introduce the basic concepts, parts of robots and types of robots.
• To make the student familiar with the various drive systems for robot, sensors and their applications in robots.

Prerequisite: Nil

Unit I- Introduction **[8]**

Robot anatomy-Definition, law of robotics, History and Terminology of Robotics-Accuracy and repeatability of Robotics-Simple problems- Specifications of Robot-Speed of Robot-Robot joints and links-Robot classifications-Architecture of robotic systems-Robot Drive systems- Hydraulic, Pneumatic and Electric system.

Unit Ii - End Effectors And Robot Controls **[8]**

Mechanical grippers-Slider crank mechanism, Screw type, Rotary actuators, cam type-Magnetic grippers-Vacuum grippers-Air operated grippers-Gripper force analysis-Gripper design-Simple problems-Robot controls-Point to point control, Continuous path control, Intelligent robot-Control system for robot joint-Control actions-Feedback devices-Encoder, Resolver, LVDT-Motion Interpolations-Adaptive control.

Unit Iii-Robot Transformations And Sensors **[8]**

Robot kinematics-Types- 2D, 3D Transformation-Scaling, Rotation, Translation- Homogeneous coordinates, multiple transformation-Simple problems. Sensors in robot – Touch sensors-Tactile sensor – Proximity and range sensors – Robotic vision sensor-Force sensor-Light sensors, Pressure sensors.

Unit Iv-Robot Cell Design And Applications **[8]**

Robot work cell design and control-Sequence control, Operator interface, Safety monitoring devices in Robot-Mobile robot working principle, actuation using MATLAB, NXT Software Introductions-Robot applications- Material handling, Machine loading and unloading, assembly, Inspection, Welding, Spray painting and undersea robot.

Unit V-Micro/Nano Robotics System **[8]**

Micro/ Nanorobotics system overview-Scaling effect-Top down and bottom up approach-Actuators of Micro/Nano robotics system-Nanorobot communication techniques-Fabrication of micro/nano grippers-Wall climbing micro robot working principles-Biomimetic robot-Swarm robot-Nanorobot in targeted drug delivery system.

Outcomes: The Student must be able to understand the basics of Robot.

Text Books:

1. Niku Saeed B., Introduction to Robotics: Analysis, Systems, Applications, PHI, New Delhi 2001
2. John J.Craig, “Introduction to Robotics”, Pearson, 2009.

Reference Books:

1. Richard D Klafter, Thomas A Chmielewski, Michael Negin, "Robotics Engineering – An Integrated Approach", Eastern Economy Edition, Prentice Hall of India Pvt. Ltd., 2006.

EC-14.302 **Microwave Engineering** **Total Lectures: 40**

3-0-0-3

Objective: To acquire fundamental knowledge of Microwave and apply in engineering applications.

Pre-requisite: Electromagnetic Field Theory.

1. **Introduction:** **[03]**
   Microwaves, Generation: Brief idea of microwave tubes and microwave solid state devices, properties and applications.

2. **Microwave Circuits:** **[07]**
   Equivalent voltage and current definition in waveguides, concept of impedance, impedance matrix, admittance matrix, scattering matrix and transmission matrix**.**

3. **Microwave Passive Devices:** **[10]**
   Excitation of waveguides through probes, loops and apertures. Terminations: matched loads and short, attenuators, phase shifters, two hole directional coupler, E-plane tee, H-plane tee, magic tee, microwave propagation in ferrites, isolators and circulators.

4. **Microwave Active Devices:** **[14]**
   Reflex Klystron, Two cavity Klystron, Travelling Wave Tubes, Magnetrons, Gyrotron, construction, operation and practical applications of Gunn diode, Tunnel diode and IMPATT diode**.**

5. **Microwave Measurements:** **[06]**
   Detection of microwaves, measurement of microwave power, impedance, frequency, VSWR, Q-factor and scattering parameters.

Outcome: After completion of the course, students would be able to apply microwave concepts and equations in engineering and solve voltage and current equations.

Text Books:

1. David M. Pozar, Microwave Engineering (Third Edition), John Willey & sons.
2. Samuel Y. Liao, Microwave devices and Circuits (Third Edition), Pearson Education.
3. Annapurna Das &Sisir K Das, Microwave Engineering (Second Edition), McGraw-Hill Companies.

Reference Book:

1. Matthew N. O. Sadiku, Principles of Electromagnetics (Fourth Edition), Oxford University Press

EC-14.304 **Principles of Digital Communication** **Total Lectures: 40**
3-1-0-4

Objective: The objective of this course is to introduce the students to the basic concepts of digital communication. The aim of this course is to study the fundamental aspects of digital communication systems. The understanding of the fundamentals of digital communication by studying theory, numerical and implementation of circuits.

Pre-requisite: The basics of Communication Systems and Techniques.

1. **Model of a Communication System:** Introduction, advantages of digital communication over analog communication, probability theory random process and random variables. **[6]**
2. **Digital Communication Techniques:** Sampling theorem and techniques, uniform and non-uniform quantization techniques, PCM, DPCM, DM, and ADM, compression standards, time division multiplexing and synchronization, Digital multiplexing hierarchy, Electrical representation of binary sequences Bandwidth requirement of PCM. **[10]**
3. **Information Theory and Coding:** Channel capacity, Shannon capacity, source entropy, Shannon-Fano, Huffman coding, linear block codes and syndrome decoding, cyclic codes, BCH codes, convolution, Viterbi coding and decoding. **[10]**
4. **Digital Modulation Techniques:** Base-band transmission, inter-symbol interference and adaptive equalization, digital modulation and demodulation techniques, bandwidth consideration of different digital modulation schemes, matched filter and probability of error analysis, carrier and timing recovery techniques. **[14]**

Outcome:

- The students can understand the concepts of digital communication.
- They acquire and apply the knowledge to implement the concepts for designing an efficient communication system.
- They become able to identify, analyse and implement new ideas in digital communication systems for proposing alternate solutions.

Text Books:

1. B. P. Lathi, "Modern Digital and Analog communication Systems", Oxford University Press, 2010.
2. P. K. Ghosh, Principles of Analog and Digital Communication, Orient Black Swan Publishers Pvt. Ltd., 1st Edition
3. H. Taub, D L Schilling, Goutom Saha, "Principles of Communication", TMH.

Reference Books:

1. Simon Haykin, "Communication Systems", Wiley India.
2. H P HSU and D Mitra, "Analog and Digital Communications", TMH
3. John G. Proakis, "Digital Communications", McGraw-Hill International.

EC-14.306 Microcontroller and Embedded Systems Total Lectures: 40
3-0-0-3

Objective: The objective of this course is to teach students design and interfacing of microcontroller-based embedded systems. The course covers fundamentals, The 8051 Architecture, Assembly Language Programming, Instruction set, Serial Communication and Interfacing techniques of 8051 Microcontroller.

Pre-requisite: Programming skills and fundamental knowledge of microcontrollers, microprocessors and digital design.

1. **Introduction to Microcontrollers, Architecture and Memory Interfacing:** Overview of the 8051 family, 8051 Microcontroller's Architecture, Pin configuration, Common memory types and Tradeoffs, External Memory interfacing. **[7]**
2. **Programming of 8051:** Addressing modes of 8051, instruction set of 8051, assembly language programming of 8051, stack structure of 8085, delays, and subroutines, Applications of interrupts, timer/counter and serial port, Components of Integrated Development Environment for software development. **[16]**
3. **Interfacing of 8051:** Interfacing of 8051 with sensors, Keyboard, ADC, DAC, LCD, Stepper Motor and D.C motor. **[8]**
4. **Introduction to Embedded systems and processors:** Introduction and Examples of Embedded Systems, Concept of Embedded System. Design challenge, Processor technology, IC technology, Design technology, Trade-offs: Custom single purpose processor hardware, general-purpose processor: introduction, basic architecture, operation, super-scalar architecture, application specific instruction set processors, microcontrollers, digital signal processors, selection of embedded processor. **[6]**
5. **Software aspect of embedded system:** Challenges and issues in embedded software development, Software and hardware requirements, Real time system, Real time operating systems, Kernel, architecture: mutex, semaphore, testing and verification. **[3]**

Outcome: Upon completion of this course, the student will be able to:

1. Program, build and test a microcontroller system.
2. Interface a microcontroller system to user controls and other electronic systems.
3. Describe the internal architecture of microcontroller systems, including counters, timers, ports, and memory.
4. Understand and design embedded systems and real-time systems.
5. For real-time systems:
    - Identify the unique characteristics of real-time systems.
    - Explain the general structure of a real-time system.
    - Define the unique design problems and challenges of real-time systems.

Text Books:

1. M. A. Mazidi, The 8051 Microcontroller & Embedded Systems; Pearson Education.
2. I. Scott McKenzie and Raphael C.W. Phan; The 8051 Microcontroller; Pearson Education.
3. Raj Kamal, Embeded System; Tata Mcgraw-Hill.

Reference Books:

1. David E Simon, An Embedded Software Primer; Pearson Education.

EE-14.304 **Power Electronics** **Total Lectures: 40**

3-0-0-3

Objective:

- To introduce to students the theory and applications of power electronics systems for high efficiency, renewable and energy saving conversion systems
- To prepare students to know the characteristics of different power electronics switches, drivers and selection of components for different applications
- To develop students with an understanding of the switching behavior and design of power electronics circuits such as DC/DC, AC/DC, DC/AC and AC/AC converters

Prerequisite: Network Analysis, Basics of Electronics Engineering, Engineering Mathematics

1. **Introduction:** Review of power semiconductor devices, SCR, Static and dynamic characteristics, Turn-on and Turn-off methods and circuits, Ratings and protection of SCRs, Series and parallel operation of thyristor, Other members of thyristor family. [8]
2. **Phase Controlled Converters:** Principle of phase control, Single phase half wave circuit with different types of loads, Single phase and three phase semi converter and full converter bridge circuits, Single phase dual converters and their operation with circulating and non-circulating currents. [10]
3. **AC Voltage Controllers:** Types of single-phase voltage controllers, Single-phase voltage controller with R and RL type of loads, gate pulse requirements to trigger the SCRs of ac voltage controllers. [5]
4. **Cyclo-converters:** Principles of operation, Single phase to single phase step up and step down cycloconverters. Three phase to single phase cycloconverter. [5]
5. **DC Choppers:** Principle of chopper operation, Control strategies, Types of choppers, Step up and step down choppers, Types of choppers and operations. [5]
6. **Inverters:** Single phase VSI: half bridge and full bridge inverters and their steady state analysis, Series and parallel inverters, three phase bridge inverters with 180 degree and 120 degree modes of operation. Current source inverters, CSI with R load (qualitative approach). [7]

Outcome:

- The student will be able to understand the principle of operation of commonly employed powerelectronic converters
- The student will be capable of analyzing non-linear circuits with several power electronic switches
- The student will be equipped to take up advanced courses in Power Electronics and its application areas

Text Books:

1. Rashid, M., Power Electronics, Prentice Hall of India Private Limited (2006).
2. P. S. Bimbhra, Power Electronics, Khanna publishers.

Reference Books:

EC-14.322 Microwave Engineering Laboratory

0-0-2-1

Objective: To acquire fundamental knowledge of Microwave active and passive devices as well as various parameters measuring with the microwave components.

Pre-requisite: EC 223 (Electronics Devices & Circuits Laboratory), EC 208 (Electromagnetic Field Theory)

1. To draw the mode characteristics of reflex klystron tube and determine it's electronic tuning range.
2. To determine the frequency and wavelength in a rectangular waveguide for dominant mode. Also verify the waveguide law.
3. To obtain the following for Gunn diode :-
   (A) V-I characteristics
   (B) Out power and frequency as a function of input voltage.
4. To measure the polar pattern, beam width and gain of following antennas :-
   (A) Pyramidal horn and pickup horn
   (B) Dielectric antenna
   (C) E-Plane
   (D) H-Plane
5. To determine following parameter of Isolator and Circulator :-
   (A) Insertion loss
   (B) Isolation
   (C) Input VSWR
6. To determine the following parameter of Magic Tee :-
   (A) Insertion loss
   (B) Isolation
   (C) Input VSWR
   (D) Coupling factor
7. To determine the following parameter of directional coupler :-
   (A) Insertion loss
   (B) Main line and auxiliary line VSWR
   (C) Coupling factor
   (D) Isolation
   (E) Directivity
8. To Calibrate the Phase shifter.
9. To Determine the standing wave ratio and reflection coefficient.
10. To Determine the impedance of unknown load with the help of smith chart.

.

Outcome: After completion of the course, students would be able to work with different active and passive devices. This course will be very beneficial for the graduates who wish to work in telecommunication industry and defense.

EC-14.324 Digital Communication Laboratory 0-0-2-1

Objective:

The objectives of the Digital Communication laboratory are:

a) To allow the students to perform experiments that demonstrate the theory of digital communication systems that will be discussed in the lecture course.
b) To introduce the students to some of the electronic components that make up digital communication systems.
c) To familiarize the students with proper laboratory procedure; this includes
    - Precise record-keeping.
    - Logical troubleshooting.
    - Safety measures.
    - Capabilities as well as limitations of measurement equipments.
d) To implement the circuits of analog modulation and demodulation on breadboard and verification of the results using CRO.
e) To implement the circuits of digital modulation and demodulation on breadboard and verification of the results using CRO.
f) To understand and practice the turning of a function generator, frequency, impedance, CRO for getting the desired results.
g) To implement the circuits/set-up of Transmission lines, Optical Fibre communication, Satellite communication and detection of the received signals by using LEDs, multimeters, speakers and CROs.
h) To study and implement BPABX(Electronic Private Automatic Branch Exchange).

Pre-requisite:

a) The basic knowledge of different electronic components like resistors, capacitors, transformers, LEDs and devices like CRO, Power Supply, Function Generator, Multimeters.
b) To operate and handle different devices like breadboard, experiment kits, CRO, Multimeter, Function Generator, Power Supply.
c) The knowledge of connecting cables and making connections using breadboard and experiment kits.
d) The familiarity with proper laboratory procedure and safety measures.
e) The conceptual and theoretical knowledge of the experiments to be performed.

Experiments:

1 To generate an AM signal and measure the depth of modulation using a CRO.

2 Study of PSK modulation and demodulation.

3 To generate a pulse Amplitude Modulation and Demodulation

4 (a)To generate a Pulse Width Modulation and demodulation.
(b)To generate Pulse Position Modulation and demodulation.

5 Measurement of Numerical Aperture of a Fiber Using Optical Fiber Trainer Kit & Measure the Bending Loss.

6 Study of FSK Modulation and demodulation

7 (a) To generate a PCM signal and demodulate it.
(b) To Study Parity error and hamming code.

8 (a) Measuring the input impedance of the transmission line.
(b) Measuring the attenuation of the transmission line.

9 Study of Time Division Multiplexing and de-multiplexing (TDM- PAM).

10 Study of Delta modulation and demodulation

11 Study of AM receiver and Transmitter

12 Study of optic fiber kits and setting the Analog & Digital link on the kits.

13 To generate the FM signal and demodulate it

14 To Understand the Basic concept of satellite communication
(a) Establish a direct communication link between Transmitter and receiver using Tone Signal.
(b) To Transmit and receive wave form (Sine wave) through satellite link.

15 To Study EPABX System and analyze various.

Outcome:

a) The student exhibits previously learned and performed experiments of analog communication by recalling them.
   - To generate an AM signal and measure the depth of modulation using a CRO.

b) They understand the basic facts and concepts of digital communication by performing experiments.
   - Study of FSK Modulation and Demodulation by implementing circuit using breadboard/kit and analyzing results using CRO.
   - To generate a PCM signal and demodulate it.
   - To generate a Pulse Width Modulation and demodulation.
   - To generate Pulse Position Modulation and demodulation by implementing circuit using breadboard/kit and analysing results using CRO.

c) They acquire and apply the knowledge to implement the concepts for designing an efficient communication system in laboratory using different devices.
   - To Establish a direct communication link between Transmitter and receiver using Tone Signal and effect of increasing and decreasing distance between the transmitter and receiver.

d) They become able to troubleshoot and identify the problems in circuit implementation.
   - The frequency tunning, impedance matching, wrong connections and malfunctioning of devices/Breadboards/Kits.

EC-14.326 Microcontroller and Embedded System Lab

0-0-2-1

Objective: To acquire the knowledge of software and hardware development, testing and debugging.

Pre-requisite: Fundamental knowledge of digital electronics, microcontrollers and programming concepts.

EXPERIMENT LIST

1.
a) Introduction to Keil µVision Integrated Design Environment software.
b) Write an ALP for 8051 to move a block of five bytes stored from locations 30H to 40H of internal RAM.

2.
a) Write an ALP for 8051 to move a block of five bytes stored from address 3000H of external data memory to address 40H of internal RAM.
b) Write an ALP for 8051 to move a block of five bytes stored from address 40H of internal RAM to address 3000H of external data memory.

3.
a) Three 8 bit numbers are stored at internal RAM locations 30H, 31H and 32H. Find out the largest number and store it at internal RAM location 40H.
b) Three 8 bit numbers are stored at internal RAM locations 30H, 31H and 32H. Find out the smallest number and store it at internal RAM location 40H.

4.
a) Introduction to Proteus software.
b) A switch 'S' is connected to P0.0 pin of 8051 controller. Develop the software and a prototype with the help of Proteus software for following operation:
(i) If 'S' = '0' then P1.0 = '0' and P1.1 = '1'
(ii) If 'S' = '1' then P1.0 = '1' and P1.1 = '0'

5. By assuming the reference temperature as 27°C develop the software and a prototype with the help of Proteus software to continuously read the present room temperature from port 1 and perform the following operations:
If (reference temperature) > (present room temperature) then P0.0 = '1'
If (reference temperature) < (present room temperature) then P0.1 = '1'
If (reference temperature) = (present room temperature) then P0.2 = '1'

6. Develop the software and a prototype on bread board for a traffic light algorithm.

7. Write a program to count ten objects on a conveyor belt, assuming that a sensor gives a pulse for every object moving on the conveyor belt. Generate a 'HIGH' signal at P1.0 pin for 5 seconds when all the objects are counted. Make suitable assumptions.

8. Develop the software and a prototype with the help of Proteus software for interfacing four push button type keys "1", "2", "3" and "4" with Port 0 of

8051 controller as one-dimensional array and a seven segment display with Port 1. The pressed key value should be displayed on seven segment display.

9. Write a program and develop a hardware prototype to toggle two LED's connected at P1.0 and P1.1 pins of 8051 with the help of interrupt.

10. A temperature sensor IC LM 35 is used to sense the temperature of a room. It is connected to an ADC and (Vref/2) pin of ADC is connected to 2 volts. A DAC is calibrated for 5 volts full scale output. A fan is connected to the DAC. Develop the hardware and software to meet the following specifications:

(i) If room temperature is ***'less than'*** 20°C then fan will be OFF.
(ii) If room temperature is ***'greater than or equal to'*** 20°C and ***'less than'*** 30°C then DAC will supply 2V to run the fan.
(iii) If room temperature is ***'greater than or equal to'*** 30°C then DAC will supply 4V to run the fan.

Outcome: After completion of the course, students would be able to develop the hardware and software required for an embedded system.

EC-15.312 Advance Radio Access Network (ARAN) Total Lectures: 40

3-0-0-3

Objective:
To acquire skills on different legacy and advance RAN's Architecture, Design & Optimization along with latest industries concepts on 5G, IOT, Volte, RAN Cloud etc.

Prerequisite:
Digital Modulation Techniques & Data Transmission, Antenna and Wave Propagation, Basics of Mobile Communication

1.	**Introduction to RAN:** Telecom E2E approach, RAN Life Cycle**,**RF basics, Microwave Theory, Propagation Models, Modulation Theory, Antenna Theory. Latest Industry Concepts – 5G, IOT, Volte, RAN Cloud	[4]
2.	**RAN Overview**:Introduction to Cellular Concepts, Introduction to Power Control, Introduction to Protocol Stacks, GSM, WCDMA, LTE (Overview, Architecture, Air Interface), Generalized Call Flows	[12]
3.	**RAN Design:**RF Design Overview, Initial Radio Network Design (Link Budget, Radio Network Dimensioning & Nominal Design), Final Radio Network Design, Radio Planning Tools & IBS Introduction, Radio Propagation Model Tuning, LRAN Initial Radio Network Design (Sample Report)	[12]
4.	**RAN Optimization:**Pre Launch Optimization (Process Overview, Introduction to Drive Testing (Data Collection Methodology, Data Post Processing),Post Launch Optimization, (Process Overview, Introduction to Counters and OSS, KPI Improvement Methodology)	[12]

Outcome: After completion of this course, students would be able to understand the industry level ways of working of RAN with different design and optimization techniques. Students will get heads up in terms of upcoming advance technologyconcepts.

Text Books:

1. Ericsson Academy (Ericsson Internal)
   - Air Interface
   - Protocol and Procedures
   - GSM, UMTS, LTE Fundamentals
   - RAN Design & Performance Management.
2. Andrea Goldsmith, "Wireless Communications", Cambridge University Press, 2007.
3. Theodore S. Rappaport, "Wireless Communication", Pearson Education, Asia, New Delhi, 2002.

Reference Books:

1. John G. Prokis and Masoud Salehi," Digital Communication", McGraw-Hill, Fifth edition.

EC 15.314 **FUNDAMENTALS OF MEMS** **Total Lectures: 40**
3-0-0-3

Objective: The objective of this course is to make students to gain basic knowledge on overview of MEMS (Micro electro Mechanical System) and various fabrication techniques. This enables them to design, analysis, fabrication and testing the MEMS based components.

Pre-requisite: Knowledge of materials and VLSI is highly desired.

1. **Introduction:** MEMS Roadmaps, Benefits of Miniaturization, Benefits of Scaling. **[2]**
2. **Fabrication Process:** oxidation, film deposition, lithography, etching, ion implantation, diffusion. **[8]**
3. **Micromachining:** Surface Micromachining: basic process flow, release, stiction, material choices, residual stress, stringers and planarization, MUMPS, Summit, electroplating, 3D out-of-plane. Bulk Micromachining: wet etch based, dissolved wafer process, SOI MEMS, Scream, Hexsil MEMS, sealed cavity deep RIE. **[6]**
4. **Process Integration:** interleaved, MEMS-first, MEMS-last, bonded integration, wafer-to-wafer transfer, fluidic assembly. **[4]**
5. **Mechanics of Materials for MEMS:** stress, strain, material properties, measurement & characterization of mechanical parameters. **[3]**
6. **Microstructural Elements:** bending moment and strain, flexural rigidity, residual stress, boundary conditions, spring combinations. **[3]**
7. **Energy Methods:** application to clamped-clamped beam under axial load, resonance frequency determination, free-free beam, disk, ring, lumped-element mechanical equivalent circuits. **[4]**
8. **Circuit Modeling of MEMS:** resonator equivalent circuits, thermal circuits, fluidic circuits. **[3]**
9. **Electronic and Mechanical Noise:** electronic noise sources, Brownian motion noise, circuit noise calculation procedure, SNR, dynamic range. **[3]**
10. **Micromechanical Circuits:** general filter topologies, insertion loss (noise figure), shape factor, design with k and q values, termination impedance, resonator and couplers, circuit modeling of coupled resonators, systematic micromechanical filter design procedure, oscillators, RF MEMS switches. **[4]**

Outcome: 1. Be familiar with the important concepts applicable to MEMS, their fabrication.
2. Be fluent with the design, analysis and testing of MEMS.
3. Apply the MEMS for different applications.

Text Books:

1. Senturia's "Microsystem Design"
2. Kovacs' "Micromachined Transducers Sourcebook"
3. Jaeger's "Introduction to Microelectronic Fabrication"
4. Chang Liu, "Foundations of MEMS", Pearson International Edition, 2006.

References Books:

2. Charles P. Poole, Frank J. Owens, "Introduction to nanotechnology" John Wiley & sons, 2003.
3. Julian W. Gardner, Vijay K Varadhan, "Microsensors, MEMS and Smart devices", John Wiley & sons, 2001.

EC 15.316 ROBOTICS AND CONTROLS Total Lectures: 40
Credit : 3-0-0-3

OBJECTIVES:

- . To get exposure about basic robot kinematics, dynamics, control and programming.

Prerequisite: Basics of Robotics

UNIT I Introduction [4]

Definition, Structure, Classification and Specifications of Robots, Industrial Robots.

UNIT II Robot Elements and Control [4]

Manipulators, Drives, Sensors, End Effectors, Configuration, Force/Torque Relationship, Trajectory Planning, Position Control, Feedback System, Digital Control.

UNIT III Modeling of Robots [10]

Coordinate Frames, Mapping and Transformation; Direct Kinematic Model; Inverse Kinematics; Manipulator Differential Motion; Static Analysis; Jacobian.

UNIT IV Manipulator Dynamics [10]

Acceleration of a rigid body, mass distribution, Newtons equation, iterative Newton Euler dynamic formulation, Lagrangian formulation of manipulator dynamics, Bond graph modeling of manipulators, Trajectory Planning.

UNIT V Linear and Non Linear Control of Manipulators [12]

Control law partitioning, trajectory following control, multi input multi output control systems, Cartesian based control scheme. Force Control of manipulators: hybrid position/force control.

Outcomes: The Student must be able to design automatic manufacturing cells with robotic control using the principle behind robotic drive system, end effectors, sensor, machine vision robot kinematics and programming.

Text Books:

1. Fu K S, Gonzalez R C, Lee C.S.G, "Robotics: Control, Sensing, Vision and Intelligence", McGraw Hill, 1987.

Common to B.Tech (ECE), MBA (ECE), BTMT (ECE – SP & VLSI base)

List of Specialization Electives

IV Year Autumn Semester (Specialization Elective III)

Sl. No.	Course Code	Course Title	Specialization Tracks
1	BS-15.411	Business Support System – Intelligent Network (In association with Ericsson)	Telecommunication Systems & Networks
2	EC-15.413	Advanced Embedded Systems	VLSI & Embedded Systems
3	EC-15.415	Robot Programming	Robotics

EC-14.401 **VLSI Design** **Total Lectures: 40**
3-1-0-4

Objective:	The educational objectives of the VLSI design course are:
1.	Graduates who desire to pursue an engineering career in VLSI Design arena will be widely employed in positions they find appropriate and desirable.
2.	Graduates who desire to pursue higher degrees will be successful in gaining mission and advancing in programs they find appropriate and desirable.
Pre-requisite:	EC-14.201 Electronics Devices and Circuits, EC-14.203 Digital Electronics.

1.	**Basic VLSI Design Issues:** IC design techniques- hierarchical design, design abstraction and computer-aided design	[4]
2.	**MOS Transistor Theory:** Current-voltage characteristics of MOSFETS, threshold voltage and body effect, MOSFET design equations, second order effects, MOSFET capacitances	[8]
3.	**NMOS and CMOS Inverter:** NMOS and CMOS inverters, W/L ratio for NMOS and CMOS inverters, β_n/β_p ratio, noise margin, NMOS and CMOS Voltage transfer Characteristics, CMOS delay and power dissipation	[8]
4.	**MOS Inverter's Switching Characteristics:** Calculation of delay times, Inverter design with delay constraints	[6]
5.	**Stick Diagram & Layout:** Stick diagrams, CMOS design style, design rules: lambda based design rules, layout design	[8]
6.	**Basic VLSI Circuit Design Techniques:** Inverter equivalent of series and parallel MOS circuits, logic design with delay and power constraints, worst case design, complex logic design	[6]

Outcomes:

- Ability to apply knowledge of mathematics, basic science, and engineering to solve problems encompassing fundamental areas of VLSI design.
- Ability to apply in-depth knowledge of VLSI design principles, systems, and devices to the solution of real time problems.
- Ability to design and evaluate a component or system to meet desired needs within the field of VLSI design.
- Ability to function as a member of a multidisciplinary team in the solution of engineering problems such as providing CAD solution for device fabrications.

Text Books:

1. Douglas A. Pucknell & Kamran Eshraghian, Basic VLSI Design, PHI, 3rd Ed., 2011
2. Neil H.E. Weste, David Harris, Ayan Banerjee, CMOS VLSI Design, A Circuits and Systems Perspective, Pearson Education, 4th Ed., 2011
3. Sung-Mo Kang, Yusuf Leblebici, CMOS Digital Integrated Circuits Analysis and Design, Tata Mc-Graw-Hill, 3rd Ed., 2003

Reference Books:

1. Jab M. Rabaey, Anantha Chandra Kasan, Borivoje Nikolic, Digital Integrated Circuits - A Design Perspective, PHI, 2nd Ed., 2012
2. Michal John Sebastian Smith, Application-Specific Integrated Circuits, Pearson Education, 6th Ed., 2009

EC-14. 403 **Antenna and Wave Propagation** **Total Lectures: 40**

3-0-0-3

Objective: To impart knowledge on basics of antenna theory and to analyze and design a start of art antenna for wireless communications and RADAR.

Pre-requisite: EC-14.208 Principles of Electromagnetics

1. **Introduction**: Basic properties of transmitting, and receiving antenna, gain, bandwidth, and polarization, Effective aperture and Friss transmission formula. [4]
2. **Physical Concept of Radiation:** Retarded potentials hertzian dipole, antenna parameters, radiation pattern, gain, directivity, effective aperture, reciprocity and radiation from dipoles of arbitrary length. [6]
3. **Theory of Array Antenna: A**rrays of point sources, Endfire and Broadside arrays, Log-periodic, Yagi-uda arrays, Analysis of Rhombic antenna. Design of Rhombic Antennas, Loop Antenna: Radiation from small loop and its radiation resistance. Helical antenna: Normal and axial mode operation. synthesis of antenna arrays using Schelkunoff polynomial method, Woodward-Lawson method [10]
4. **Frequency Independent Antenna:** Slot, horn antenna, parabolic antenna, aperture antennas and microstrip antenna:Basic characteristics of microstrip antennas, feeding methods, methods of analysis, design of rectangular and circular patch antennas. [8]
5. **Wave Propagation:** Propagation in free space. Propagation around the earth, surface wave propagation, structure of the ionosphere, Sky wave propagation- propagation of plane waves in ionized medium, Determination of critical frequency, MUF. Fading, troposphere propagation, Super refraction. [7]
6. **Antennas for Mobile Satellite System:** Antenna for aeronautical mobile systems, cell-site and mobile antenna, adaptive antennas. [5]

Outcomes: After completion of the course, students will be able to

- select the appropriate portion of electromagnetic theory and its application to antennas.
- distinguish the receiving antennas from transmitting antennas, analyze and justify their characteristics.
- assess the need for antenna arrays and mathematically analyze the types of antenna arrays.
- distinguish primary from secondary antennas and analyze their characteristics by applying optics and acoustics principles.
- outline the factors involved in the propagation of radio waves using practical antennas.

Text Books:

1. C. A. Balanis, Antenna Theory and Design, 3rd Ed, John Wiley & Sons, 2005.

2. W. L. Stutzman, and G. A. Thiele, Antenna Theory and Design, 2nd Ed, John Wiley & Sons, 1998.

3. R. S. Elliot, Antenna Theory and Design, Revised edition, Wiley-IEEE Press, 2003.

Reference Books:

1. R. E. Collin, Antennas and Radio Wave Propagation, McGraw-Hill, 2014.
2. K.D. Prasad, Antenna and Wave Propagation, 3rd Ed., Satya Prakashan, New Delhi, 2003

EE-14.303 **Control System Engineering** **Total Lectures: 40**
3-1-0-4

Objective: The student gains the knowledge of the fundamental principles of analog and digital control system engineering, time response and frequency response analysis with its practical implementation. This course helps in understanding the design of Compensator and PID controller for the Automatic control of Industry.

Pre-requisite: MA-14.201 Applied Mathematics, EE-14.201 Network Analysis & Synthesis

1. **Introduction:** Introduction to control systems, digital control system, types of control systems and their examples, mathematical modeling of systems (mechanical and electrical). [10]
2. **Reduction Techniques:** Block diagram reduction and signal flow graph representation of systems. [10]
3. **Domain Analysis:** Time domain and frequency domain analysis of systems. [7]
4. **Stability:** Concept of stability and algebraic criteria (Hurwitz's and Routh's stability criterion). [4]
5. **Plotting Techniques:** Root locus techniques, Bode plots, polar plots Nyquist criterion and Nichol's chart. [7]
6. **State Variables:** State variable analysis and design. [2]

Outcome: After completion of the course,

- The student will be able to get acquainted of analog and digital control system.
- The student will analyze and to design and development of automatic controller for industrial application.
- The student will gain the knowledge of stability analysis and improvement of stability for control system.
- This course becomes very beneficial for the graduates who wish to work in core sectr industry as most of the core sector is state-of-art control.
- This course becomes very beneficial for the 4^{th} year student who will choose elective paper in Digital control system and other control system elective.

Text Books:

1. K. Ogata, "Modern Control Engineering," Pearson Education/Prentice Hall of India, 2003.
2. I. J. Nagrath and M. Gopal, "Control System Engineering," New Age International Publishers, 2003.
3. M. N. Bandyopadhyay, "Control Engineering Theory and Practice," Prentice Hall of India, 2003.

Reference Books:

1. Syed Hasan Saeed, "Automatic Control Systems (with MATLAB Programs)," S. K. Kataria & Sons, Publisher of Engineering & Computer Books.
2. Samarjit Ghosh, " Control Systems: Theory and Applications," Pearson Education, Second Edition, 2009

EC-14.441 **Principles and Practices of Management** **Total lectures : 26**
Credits : 2-0-0-2

Prerequisite(s): None

Objective(s):

1. To expose the students to fundamental concepts of management and its processes in organizations.
2. To describe the various skills necessary for effective managers.
3. To explain the Individual and Group Behavior along with various leadership Styles

1. **Planning and Organizing** [5]
   Management: Concept, Nature and functions; Planning: Concept, Missions, Objective and Strategies, Steps in Planning; Organizing: Concept, Formal an Informal Organization, Decentralization of Authority, Delegation of Authority, Principles of Organizing, Line and Staff Authority.

2. **Staffing and Controlling** [4]
   Staffing: Definition, Recruitment, Selection, Placement, Promotion, Separation, Performance Appraisal; Controlling: Concepts and Process, Controlling as a Feedback System, Requirements for Effective Control.

3. **Motivation** [4]
   Concept; Theories and Process of Motivation: Maslow's Need-Hierarchy Theory, Herzberg's Hygiene Theory, Goal-Setting Theory, Vroom's Expectancy Theory.

4. **Personality** [3]
   Concept and Determinates, Types and Traits, Personality Attributes Influencing Organizational Behavior, Locus of Control, Machiavellianism, Self-Esteem, Self-Monitoring, Risk-Taking.

5 **Group Behavior and Interpersonal Relationship** [6]
   Groups: Concept and Classification, Stages of Group Development, Rolesand Norms, Group Decision-Making: Group versus Individual, Group Decision Making Techniques and Process, Interpersonal Relationships, Understanding Self and Others, Developing Interpersonal Relationships, Transactional Analysis, Johari Window.

6. **Leadership** [4]
   Concept and Functions; Theories of Leadership: Traits, Behavioral, Situational/Contingency; Inspirational approaches to Leadership: Charismatic Leadership, Transformational Leadership, Transactional Leadership, and Contemporary Leadership.

Outcome(s): By studying this Course, students would be able to understand various Management functions, individual and group behavior. They would also know various styles of Leadership and its applicability. The course would help the students in understanding various organizational contexts and help them understand organizational systems in a better way.

Text Books:

2. Robbins, Stephen P., Timothy Judge and Neharika Vohra, Organizational Behavior, 12th Ed., Pearson Education, 2011.

Reference Books:

1. Prasad L. M., Principles and Practice of Management, 9th Edition, Sultan Chand & Sons, 2015
2. Aswathappa K. Organizational Behavior, Eighth Edition, Himalaya Publishing House.
3. James A. F. Stoner, Freeman A. Edward, and Daniel A. Gilbert Jr., Management, Pearson Education
4. Fred Luthans, Organisational Behaviour, 11th Ed., Mc - Graw Hill, 2009

EC-14.421 **VLSI Laboratory** **0-0-2-1**

Objective: To introduce various aspects of VLSI circuits and their design.

Pre-requisite: EC-14.203 Digital Electronics, EC-14.201 Electronics Devices and Circuits

Using the Tanner EDA tools

i) Study the V-I characteristics of NMOS transistor

ii) Study of different invertor designs
   a) Resistive load inverter
   b) NMOS load inverter
   c) PMOS load inverter
   d) CMOS inverter

iii) Implement and verify the functionality for the following using CMOS technology
   a) Two input NAND gate
   b) Two input NOR gate

iv) Implement and verify the functionality for a Boolean function using CMOS technology.

v) Draw the layout for the following and verify its functionality.
   a) CMOS inverter
   b) two input NAND gate
   c) two input NOR gate

vi) Draw and verify the layout the following function

$$X = \overline{(AB + D + EF)}$$

vii) Study of different design styles

vii) Implementation of minor project based on VLSI

Outcome: Generalize the design techniques and analyze the characteristics of VLSI circuits such as area, speed and power dissipation

Text Books:
1. N. H. E. Weste et al, CMOS VLSI design, 3rd Ed., Pearson, 2005.
2. S. M. Kang & Y. Leblebici, CMOS Digital Integrated Circuits, McGraw Hill, 1999.

Reference Books:
1. Uyemura, Introduction to VLSI Circuits and Systems, Wiley, 2002.

EC-14.423 **Antenna and Wave Propagation Laboratory** **0-0-2-1**

Pre-requisite: EC-14.208 Principles of Electromagnetics

1 To Draw the radiation pattern and find the front to back ratio, *VSWR*, Half power beam width of following Antenna's using ST 2261 Antenna Kit

(a) Zeppelin (b) Combined Collinear Array (c) Helix (d) λ/2 Phase Array

(e) λ/4 Phase Array (f) Slot λ/2

2 To Draw the radiation pattern and find the Front to back ratio, VSWR, half power beam-width of following antennas using ST2261Antenna Kit

(A) Yagi-Uda Folded Dipole (3E, 5E) (B) Yagi-Uda Simple Dipole (5E,7E) (C) Simple dipoles (λ/2, λ/4) (D) Folded Dipole

(E) Hertz (F) Ground Plane (G) Log Periodic

3 To Draw the radiation pattern and find the Front to back ratio, VSWR, half power beam width of following antennas using S 45 Antenna Set-up

(A) Dipole L/2 (B) Slotted Cylindrical (C) Yagi 5Element (D) Loop Square

(E) Quad Loop

4 To Draw the radiation patter n and find the Front to back ratio, VSWR, half power beam width of following antenna using S-54 Antenna Set-up

(A) Dipole L/2,L (B) Rectangular Slot (C) Broad side Array (D) Log Periodic Array

(E) End-Fire Array (F) Discone (G) Helical (H) Vertical

5 To Draw the radiation pattern and find the Front to back ratio, VSWR, half power beam width of following antenna using S-99 Antenna Set-up

(A) Printed Dipole Antenna (B) Shielded Loop Anten (C) Log-Periodic (D) Broad side Array

(E) End Fire Array (F) Micro strip (G) Patch Circularly Polarized (H) Spiral Antenna

Outcome: After completion of the Laboratory, students will be able to

(a) Realize the importance of radiation pattern.
(b) Work out the complete design aspects of various antennas.
(c) Distinguish primary from secondary antennas and analyze their characteristics.
(d) Know the significance of various antenna parameters.

Text Book: Lab Manual

EE-14.323 **Control System Laboratory**

0-0-2-1

Objective: This laboratory course facilitates the students to get a comprehensive exposure to various techniques /principles and applications of control systems for real life implementation like like temperature control of oven, position control of DC/AC servomotor, synchro devices as a control transformer, robotic control systems etc.

1. To study the performance of various types of controllers (P, PI, PID) in order to control the temperature of an oven.
2. To study the performance analysis of PC based analogue and digital motor control system (DCMC) with second order feedback system behavior.
3. To study the characteristics of a Synchro Transmitter Receiver pair and use these as torque-synchro and angular error detector.
4. To study the performance characteristics of angular position error detector (AC&DC excitation) using two Potentiometers.
5. Using Nyquist Stability technique, find the stability of negative feedback control system whose open loop transfer function is given by $G(s)\,H(s) = 10/[\,(s+1)\,(s+2)\,(s+3)\,]$ Also verifies the MAT lab results/stability with theoretical method after ploting on graph sheets.
6. To study the performance characteristics of an AC servo motor angular position control system and analysis of transient characteristics with gain Variation.
7. To study the performance characteristics of a DC servo motor angular position control system and analysis of transient characteristics with gain Variation and additional tachometer feedback.
8. To study the Characteristics of an A.C. Servo Motor and determine its transfer function.
9. Plot the Root locus diagram for investigating the stability for the system whose open loop transfer function given by $G(s)\,H(s) = K/[s\,(s+4)\,(S+5)]$. Using MAT Lab Code, verify the results with Conventional method.
10. To study and design the pc based universal robotic system as snake.
11. Draw the bode plot for the transfer function $G(s) = 50/[s\,(1+0.25s)\,(1+0.1s)]$. From the graph, determine:
    1. Gain Crossover Frequency
    2. Phase Crossover Frequency
    3. Gain Margin
    4. Phase Margin
    5. Stability of the system

Also, verify the mat lab results with theoretical value.

12. Obtain the state space, pole-zero and residue pole form of the control system whose transfer function is given by

Outcome: The students shall develop an insightful knowledge on various techniques and concepts of analysis & design of control system for different applications like temperature control of oven, position control of DC/AC servomotor, synchro devices, Robotic control systems etc.

EC-14.433 Industrial Training Seminar Credits: 2

Industrial training plays a very important role for engineering graduates of all disciplines. As an engineering student, training can help to implement the concepts that students have learnt in their classes.

Objective: To enhance the knowledge of the students on different cutting edge technologies which have become important part of respective industries.

Industrial training offers the following:

1. Experience of industrial environment/conditions to girls students.
2. Enable the students to learn engineering techniques by observation and practice.
3. Show how theory presented in class is applied in practice.
4. Provide contact with practicing engineers.
5. Familiarize the student with practices and problems faced by companies employing engineers.
6. Give the student the responsibility of completing a piece of work.
7. Enable and accord industry opportunity to shape and participate in the development of future human resources.

Training Outcomes and Assessment

1. Ability to acquire and apply fundamental principles of science and engineering.
2. Capability to communicate effectively
3. Ability to identify, formulate and model problems and find engineering solution based on a systems approach.
4. Ability to conduct research in the chosen fields of engineering.
5. Understanding of the importance of sustainability and cost-effectiveness in design and developments of engineering solution.
6. Ability to be a multi-skilled engineer with good technical knowledge, management, leadership and entrepreneurship skills.
7. Awareness of the social, cultural, global and environmental responsibility as an engineer.
8. Capability and enthusiasm for self-improvement through continuous professional development and life-long learning.

BS-15.411 Business Support System – Intelligent Network (BSS-IN) 3-0-0-3

Total Lecture: 42

Prerequisites: Linux Basic, Database Basic, TCP/IP Basic.

1 Introduction to Telecom Market **[2]**

Customer and Vendors, How Adds and promotion benefits, Statistics (Postpaid/Prepaid).

2 Unit 2: GSM Basic and Evolution **[4]**

Architecture, Call Flows (Cover RAN/CORE/IN), OSI/SS7 Basic, Evolution (2G to 5G)

3 Unit 3: Intelligent Network Overview **[11]**

Common Charging Architecture - High Level Common Architecture, Charging Mechanisms, Charging Functions- Offline Charging Funtions; Offline Charging Funtions; Architecture Mapping ,Charging Principles; Charging data generation and quota supervision; Charging information utilization, OCS - Required Functionality, OCS - Reference Model/Architecture, OCS Rating Function, OCS Functionality Message Flows, OCS CDRs, Policy Control And Charging; Reference Architecture;Policy Control Requirements; Reference Points; Functional Entities; PCC Rules; QoS Rules; PCC Procedure and Flows, Refill And voucher management, Subscriber/Customer management - Customer Care

4 Unit 4*:* Billing Mediation and Provisioning Basic **[14]**

CDR, UDR, TAP files, RAP files, NRTRDE, Billing System architecture (Mediation, usage and tariff database, formatting and rating processes, invoice generation),Types of usage (duration, volume, QoS, day and time, number of events, type of service),Types of rating (batch rating, pre-event rating, post-event rating, backwards rating, prepaid balance management, spending control/unbilled limit), Standard rating functions (staircase, offset, linear), Parameters of billing (usage & recurring &onetime charges, discounts & fees & taxes),Types of billing (regular, on-demand, immediate, simulation, information), Different product features (supports MVNO, real-time discounts, cross discounts, shared balances, multiple balances), Different marketing tools (business partners, bundles and counters, F&F, free units, discounts), Typical Telecom Environment: Multivendor environment, Std Protocols & proprietary Interfaces, Integration challenges, File Mediation fundamentals: ASN.1, Need, Typical Use Cases, Architecture, Event Mediation fundamentals: Diameter, 3GPP, Need, Typical Use Cases, Architecture

Provisioning fundamentals: MML, CAI, CAI-3G etc, Need, Typical Use Cases, Architecture

5 Protocols/Tools **[9]**

TCP/IP/SCTP; Stack Description ; Connection Flow; Messages Flow; Use Cases ,SIGTRAN/SS7; Stack Description; Connection Flow; Messages Flow; Use Cases, DIAMETER; Stack Description; Connection Flow ;Messages Flow; Use Cases, CAMEL ; Stack Description; Connection Flow ;Messages Flow ;Use Cases

6 3PP Services integration with BSS [2]

Integration With CRBT/MoMo, IVR Services, Practical Example/Use Cases.

Assessment [2]

EC 15.413 **Advanced Embedded System** **Total Lectures: 40**

3-0-0-4

Objective:

1. To teach the Fundamentals on design attributes of functional units of a Processor
2. To discuss on Hardware software partitioning in system design
3. To teach intra & Inter processor Communications
4. To discuss strategies for processor Communications

Understanding of necessity of operating system in advanced embedded systems.

Prerequisite: EC 14.202 Microprocessor Programming and Interfacing, EC 14.306 Microcontroller and Embedded System

7. Introduction to Embedded Hardware and Software: Terminology – Gates – Timing diagram – Memory – Microprocessor buses – Direct memory access – Interrupts – Built interrupts – Interrupts basis – Shared data problems – Interrupt latency - Embedded system evolution trends – Interrupt routines in an RTOS environment. [8]
8. System Modelling with Hardware/Software Partitioning: Embedded systems, Hardware/Software Co-Design, Co-Design for System Specification and modelling- Single-processor Architectures &,Multi-Processor Architectures, comparison of Co- Design Approaches, Models of Computation, Requirements for Embedded System Specification, Hardware/Software Partitioning Problem, Hardware/Software Cost Estimation, Generation of Partitioning by Graphical modelling, Formulation of the HW/SW scheduling, Optimization. [8]
9. Hardware/ Software Co-Synthesis: The Co-Synthesis Problem, State-Transition Graph, Refinement and Controller Generation, Distributed System Co-Synthesis. [8]
10. Memory and Interfacing: [8]
    Memory: Memory write ability and storage performance – Memory types – composing memory – Advance RAM interfacing communication basic – Microprocessor interfacing I/O addressing – Interrupts – Direct memory access – Arbitration multilevel bus architecture – Serial protocol – Parallel protocols – Wireless protocols – Digital camera example.
11. Concurrent Process Models and Hardware Software Co-Design: Modes of operation – Finite state machines – Models – HCFSL and state charts language – state machine models – Concurrent process model – Concurrent process – Communication among process –Synchronization among process – Implementation – Data Flow model. Design technology – Automation synthesis – Hardware software co-simulation – IP cores – Design Process Model. [8]

Outcomes: After completing this module, students will be expected to be able to:

1. Implement a RTOS based embedded system and uunderstand the embedded systems design process.
2. Define a specification for an embedded system.
3. Design an embedded system based on a specification.
4. Discuss methods for implementing reliable embedded systems to solve various problems.

Compare and contrast different options for the realisation of embedded systems and their suitability for their application domain.

EC 15.415 ROBOT PROGRAMMING Total Lectures: 40
Credit : 3-0-0-3

OBJECTIVES: To study the use of robot programming for various applications.

Prerequisite: Nil

UNIT I - Basics of Robot Programming [8]

Robot programming-Introduction-Types- Flex Pendant- Lead through programming, Coordinate systems of Robot, Robot controller- major components, functions-Wrist Mechanism-Interpolation-Interlock commands- Operating mode of robot, Jogging-Types, Robot specifications- Motion commands, end effectors and sensors commands.

UNIT II - Val Language [8]

Robot Languages-Classifications, Structures- VAL language commands motion control, hand control, program control, pick and place applications, palletizing applications using VAL, Robot welding application using VAL program-WAIT, SIGNAL and DELAY command for communications using simple applications.

UNIT III - Rapid Language [8]

RAPID language basic commands- Motion Instructions-Pick and place operation using Industrial robot- manual mode, automatic mode, subroutine command based programming. Move master command language- Introduction, syntax, simple problems.

UNIT IV - Practical Study of Virtual Robot [8]

Robot cycle time analysis-Multiple robot and machine Interference-Process chart-Simple problems-Virtual robotics, Robot studio online software- Introduction, Jogging, components, work planning, program modules, input 13 RB-2013 SRM and output signals-Singularities-Collision detection-Repeatability measurement of robot-Robot economics.

UNIT V - VAL-II and AML [8]

VAL-II programming-basic commands, applications- Simple problem using conditional statements-Simple pick and place applications-Production rate calculations using robot. AML Language-General description, elements and functions, Statements, constants and variables-Program control statements-Operating systems, Motion, Sensor commands-Data processing.

Outcomes: Upon completion of this course the students can able to understand the basic of Robot programming.

Text Books:

1. Mikell P. Groover et. al., "Industrial Robots - Technology, Programming and Applications", McGraw Hill, New York, 2008.
2. Deb. S. R. "Robotics technology and flexible automation", Tata McGraw Hill publishing company limited, 1994.

1. Fu. K. S., Gonzalez. R. C. & Lee C.S.G., "*Robotics control, sensing, vision and intelligence"*, McGraw Hill Book co, 1987.
2. Craig. J. J. "*Introduction to Robotics mechanics and control"*, Addison-Wesley, 1999.

EC-18.402 **Wireless Networks** **Total Lectures: 40**
3-1-0-4

Objective: To acquire fundamental knowledge of various types of wireless networks and apply them to wireless communication applications.

Pre-requisite: EC-14.303 Principles of Analog Communication, EC-14.304 Principles of Digital Communication

1. **Introduction:** Introduction to wireless networks, Wireless communication systems – Paging system, cordless telephone system, cellular telephone system [4]

2. **Basics of cellular communication systems**: Frequency reuse, channel assignment, call handoff, interference and system capacity, Mobile radio propagation – path loss and fading, 2G, 2.5 G and 3G wireless networks**.** [10]

3. **Multiple Access Techniques**: Frequency Hopped Multiple Access, Code Division Multiple Access, Hybrid Spread Spectrum Multiple Access, Packet Radio, Carrier Sense Multiple Access, Reservation Protocol [10]

4. **Equalization, Diversity and Channel Coding**: Fundamentals of equalization, Linear equalization, Nonlinear equalization, Diversity techniques – space diversity, time diversity, frequency diversity, polarization diversity, RAKE receiver, Block code and convolution code. [8]

5. **Wireless Networking**: Wireless local area network, RF and IR WLAN, advantages and applications, IEEE 802.11, IEEE 802.16, HYPERLAN, Bluetooth, WiMax, Ultra Wide Band communication. [8]

Outcome: After completion of the course, students would be able to apply wireless communication concepts and ideas to engineering applications and to develop high performance wireless communication network.

Text Books:

1. T. S. Rappaport, Wireless Communication, Principles and Practice, 2nd Ed, Pearson Education, 2009
2. Upena Dalal, Wireless Communication, Oxford University Press, 1st Ed., 2009.
3. J. Schiller, Mobile communications, Addison-Wesley.

Reference Book:

1. William C. Y. Lee, Mobile cellular telecommunication – Analog and Digital systems, McGraw Hill, 2nd Ed, 2006

EC-18.442 **Engineering Economics** **Total Lectures: 26**
Credit: 2-0-0-2

Prerequisite(s): Nil

Objective(s):
1. Provide students with fundamental concepts of engineering economics.
2. Provide students with economical methods to compare and evaluate alternatives based on present, annual, rate of return, and benefit over cost analyses.
3. Emphasize practical engineering-based applications and the use of real data examples.

1. **Introduction**: Definitions, Scope; Microeconomics vs. Macroeconomics; Engineering and engineering economics; Principles of engineering economics. [2]
2. **Theory of Demand & Supply**: Determinants, law of demand, law of supply, equilibrium, elasticity of demand. [3]
3. **Economics Applied to Industries**: Theory of production; production function, Law of variable proportions, Returns to scale, Theory of cost; Various concepts of cost: Fixed cost, variable cost, average cost, marginal cost, money cost, real cost, opportunity cost, average cost, marginal cost, total cost etc; Break even analysis. [6]
4. **Market Structures& Pricing Techniques:** Meaning of Market, Types of Market- perfect competition, Monopoly, Oligopoly, Monopolistic Competition (Main features of these markets). [5]
5. **Replacement analysis and depreciation**: Replacement Analysis Decision Map, Basic aspects of depreciation, Deterioration & Obsolescence, and its methods [3]
6. **Optimization technique**: Optimization under constraints and without constraints, optimal resource allocation, optimization under risk and uncertainty. [4]
7. **Capital budgeting**: Concept; under certainty and uncertainty, Techniques; Discounting &compounding techniques, IRR, NPV, PBP, Profitability index, Accounting rate of return. [3]

Outcome(s):
1. Understand major principles of economic analysis for decision making among alternative courses of action in engineering.
2. Apply cost estimation and alternative analysis techniques for engineering applications.
3. Recognize the economic impact of engineering solutions.
4. Calculate depreciations and understand the impact of inflation.
5. Perform breakeven analysis for a single project and between two alternatives.

Text Books:
1. Salvatore, Dominick. Managerial Economics, Prentice Hall of India, 6th Ed.
2. D. N. Dwivedi, Managerial Economics, OUP, Vikas Publication, 7th Ed.

Reference Books:
1. Suma Damodran, Managerial Economics, OUP, 2nd Ed.

EC-18.434 **Technical Seminar** **Credit: 0-0-0-2**

Objective:

1. To encourage the students to study advanced engineering developments and state-of-the-art activities.
2. To develop skills to prepare technical report writing and presentation.
3. To encourage the students to use various teaching aids such as overhead projectors, power point presentation and demonstrative models.

During the seminar session each student is expected to prepare and present a topic on engineering/ technology, for duration of about 10 to 15 minutes. The performance of the student will be evaluated based on slide preparation, presentation, ability to address question, etc. At the end of the semester, she will have to submit a technical report on her topic of seminar.

Outcomes:

1. Ability to review, prepare and present technological developments
2. Ability to face the placement interviews

*Theory: Assignments and regularity will be evaluated out of 10(ten) marks in a semester.
Practicals: Practical records and regularity will be evaluated 4 (four) times in a semester. Each evaluation will be out of 10 (ten) marks.
** Theory: Two mid-term examinations of 20 (twenty) marks each
Practicals: Viva/ Quizzes will be held 4 (four) times in a semester, each of 10(ten) marks.
† Evaluation of proficiency will be based on the participation in co-curricular activities.
†† Students will go for an industrial training programme of 8 (eight) weeks in the summer after the end of III year Spring semester examination.

N.B. The curricular structure is subject to revision from time to time, which will be duly notified.

*Spring: Group II: ECE, EE, ME, MBA (Tech) CSE, ECE Autumn: Group I: CSE, ICT, BTMT (CSE, ECE)
** Spring: Group I: CSE, ICT, BTMT (CSE, ECE) Autumn: Group II: ECE, EE, ME, MBA (Tech) CSE, ECE

MA-14.101 **Mathematics-I** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): NIL

Objective(s):

- To acquire fundamental knowledge of Mathematics and apply in engineering disciplines.

1. **Calculus:** Review of basic concepts, partial differentiation, Euler's theorem on homogeneous functions, Taylor's series and Jacobian, maxima and minima of functions of two variables, asymptotes, tracing of simple Cartesian curves, length of plane curves, area bounded by the curves, multiple integrals (double and triple integrals, change of order of integration), physical interpretations and applications. [16]
2. **Three-dimensional Geometry**: Direction cosines and direction ratios of a straight line, equation of a plane, plane passing through intersections of two planes, equations of a straight line, the shortest distance between two skew lines, the equation of a sphere, intersection of plane and sphere. [10]
3. **Matrix Theory**: Rank of matrix, linear dependence and independence of vectors, solution of system of simultaneous linear equations, Eigen values, Eigenvectors of a matrix, statement of Cayley-Hamilton theorem (without proof) , reduction of a matrix to diagonal form, quadratic forms, linear transformation of a quadratic form, and applications. [10]
4. **Theory of Equations**: Introduction of polynomials, the relation between roots and coefficients, Cardon's method. [4]

Outcome(s):

- After completion of the course, students would be able to apply mathematical knowledge in engineering and solve curriculum problems.

Text Books:

1. Grewal, B.S. and Grewal, J.S., Higher Engineering Mathematics, Khanna Publishers, Daryaganj, New Delhi, 40th Edition, 2007.
2. B. V. Ramana, Higher Engineering Mathematics, Tata McGraw-Hill Publishing Company Limited, New Delhi, 2nd Edition 2007.
3. Narayan Shanti, Analytical Solid Geometry, S. Chand and Company, New Delhi, 1971

Reference Books:

1. Kreyszig Erwin, Engineering Mathematics, John Wiley and Sons, New York, ISBN: 04717289777/0471726478, 9th Edition, 2005.
2. Ram Babu, Engineering Mathematics, 1st Edition, Pearson, New Delhi, ISBN: 978-81-317-26914.
3. Veerarajan T., Engineering Mathematics (for first year), TMH Publishing Company Limited, New Delhi, 2nd Edition 2001.

MA-14.102 **Mathematics-II** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): NIL

Objective(s):

- To acquire fundamental knowledge of Mathematics and apply in engineering disciplines.

1. **Computational Methods**: Introduction and importance of numerical analysis, calculus of finite differences, interpolation schemes for equal and unequal intervals (Newton's forward and backward interpolation formulae), divided difference, interpolation for unequal intervals (Newton's divided difference and Lagrange interpolation formulae), solution of algebraic and transcendental equations by Newton-Raphson method, applications to Engineering. [13]
2. **Ordinary Differential Equations:** First order and first-degree differential equations (variable separable, homogeneous, linear, exact equations, linear differential equations of second order with constant and variable coefficients (complementary functions and particular integrals) and applications. [12]
3. **Partial Differential Equations**: Formation of partial differential equations, Lagrange's multipliers method for the solution of first order differential equations, separation of variables for nonlinear differential equations and applications. [5]
4. **Vector calculus**: Vector and scalar point functions, conservative fields, gradient of scalar point functions, divergence and curl of vector point functions (Solenoidal and irrotational vectors), directional derivative of scalar point functions, work done along a curve, integration of vectors, line integral (work done), surface integral, volume integral, physical interpretations and applications. [10]

Outcome(s):

- After completion of the course, students would be able to apply mathematical knowledge in engineering and solve curriculum problems.

Text Books:

1. Grewal, B.S. and Grewal, J.S., Higher Engineering Mathematics, Khanna Publishers, Daryaganj,New Delhi, 40th Edition, 2007.
2. B. V. Ramana, Higher Engineering Mathematics, Tata McGraw-Hill Publishing Company Limited,New Delhi, 2nd Edition 2007.
3. Narayan Shanti, Analytical Solid Geometry, S. Chand and Company, New Delhi, 1971.

Reference Books:

3. Veerarajan T., Engineering Mathematics (for first year), TMH Publishing Company Limited, New Delhi, 2nd Edition 2001.

PY-14.101 **Engineering Physics** **Total Lectures: 40**

Credit: 3-0-0-3

Prerequisite(s): NIL

Objective(s):

- To make a bridge between the physics in school and engineering courses.

1. **Modern Physics**: Introduction to black body radiation spectrum, photoelectric effect, Compton effect. Wave-particle Dualism, deBroglie hypothesis, de Broglie wavelength, extension to electron particle, Davisson and Germer experiment, matter waves and their characteristic properties, phase velocity, group velocity and particle velocity, relation between phase velocity and group velocity, relation between group velocity and particle velocity, expression for deBr;oglie wavelength using group velocity. [8]
2. **Quantum Mechanics:** Heisenberg's uncertainty principle and its physical significance, application of uncertainty principle (non-existence of electron in the nucleus, explanation for decay and kinetic energy of electron in an atom), wave function, properties and physical significance of wave function, probability density and normalization of wave function, setting up of one dimensional time independent Schrodinger wave equation, eigenvalues and eigenfunctions, application of Schrodinger wave equation, energy eigenvalues for a free particle, energy eigenvalues and eigenfunctions for a particle in a potential well of infinite depth. [7]
3. **Electrical Conductivity in Metals**: Free–electron concept, classical free electron theory Assumptions, drift velocity, mean collision time and mean free path, relaxation time, expression for drift velocity, expression for electrical conductivity in metals, effect of impurity and temperature on electrical resistivity of metals, Quantum free electron theory assumptions, Fermi – Dirac statistics, Fermi-energy, Fermi factor, density of states (No Derivation), expression for electrical resistivity / conductivity, temperature dependence of resistivity of metals, electron in a periodic potential, origin of the energy gap, band theory of solids, distinction of solids into metals, semiconductors and insulators. [8]
4. **Dielectric & Magnetic Properties of Materials**: Dielectric constant and polarization of dielectric materials, types of polarization, equation for internal field in liquids and solids (one dimensional), Ferro and Piezoelectricity, frequency dependence of dielectric constant, important applications of dielectric materials, classification of dia, para and ferro-magnetic materials, hysteris in ferromagnetic materials, soft and hard magnetic materials, applications. [7]
5. **Lasers and Optical Fibers**: Einstein's coefficients (expression for energy density), requisites of a Laser system, condition for laser action, principle, construction and working of CO_2 laser and semiconductor laser, applications of laser – Laser welding, cutting and drilling, measurement of atmospheric pollutants, holography–principle of recording and reconstruction of images, applications of holography, propagation mechanism in optical fibers, angle of acceptance, numerical aperture, types of optical fibers and modes of propagation, attenuation, application, block diagram discussion of point to point communication. [10]

Outcome(s):

- The student will be able to understand many modern devices and technologies based on lasers and optical fibers. A student can also appreciate various material properties which are used in engineering applications and devices.

Text Books:

1. S. O. Pillai, Solid State Physics, Sixth Edition, New Age International.
2. V. Rajendran, Engineering Physics, TMH.

Reference Book: 1.G. K. Shivkumar, Engineering Physics, Prism Book Pvt. Ltd.

CY-14.101 **Engineering Chemistry** **Total Lectures: 40**

Credit: 3-0-0-3

Prerequisite(s): NIL

Objective(s):

- To purify the most valuable natural resource of the future-water.
- To understand one of the most versatile Engineering Materials: Polymers their preparation, properties and uses.
- To develop the basics of protecting engineering materials from the natural forces.
- To understand the present-day up-to-date knowledge of the contemporary energy sources.
- To build up the basis of the future Engineering materials like superconductors, conducting organic polymers, Nanomaterials etc.

1. **Water treatment**: Hardness, types of hardness, determination of hardness by complex metric (EDTA) method, degree of hardness, boiler troubles: corrosion, sludge and scale formation, prevention of sludge and scale formation in boilers, methods of boiler water treatment: lime-soda process, permutit (zeolite) process, ion exchange methods, numerical problems based on water treatment (lime-soda process). [10]
2. **Organic and Inorganic Polymers:** Classification, functionality, types of polymerization, mechanism of addition polymerization, plastics: thermoplastic and thermosetting resins, preparation, properties and uses of Polyamides, Bakelite, Polyesters, Rubber, vulcanization of rubber, synthetic rubber viz. Buna-S, Buna-N, Butyl and Neoprene rubbers, Silicones-polysiloxanes and Sulphur based polymers. [8]
3. **Electrochemistry and Corrosion**: Classifications (Galvanic cell, electrolytic cell), types of electrodes (reference electrodes-standard hydrogen electrode, indicator electrodes- glass electrode), the origin of electrode potential, Nernst equation of electrode potential. electromotive force, electrochemical series. corrosion: definition and its significance, theories of corrosion, mechanism of corrosion, types of corrosion, Galvanic cell, and concentration cell, water line corrosion, pitting & stress corrosion (caustic embrittlement), protection against corrosion, corrosion control (corrosion inhibitors, cathodic protection - sacrificial anodic and impressed current cathodic protection), protective metallic coatings. [10]
4. **Fuels:** Classifications of fuels, Comparison of solid, liquid & solid fuels, Calorific value of a fuel, Bomb calorimeter, determination of LCV & HCV, petroleum: origin, composition, processing, cracking, synthetic petrol, refining, reforming, knocking, unleaded petrol, LPG as a gaseous fuel, numerical problems based on combustion. [6]
5. **New Engineering Materials**: Introduction: superconductors, high and low-temperature superconductors, organic electronic materials, fullerenes and nanomaterials, industrial applications of fullerenes and nanomaterials. [6]

Text Books:

1. Jain and Jain, Engineering Chemistry, 15th Edition, 2006, Dhanpat Rai Publishing Company.
2. S.S. Dara, A Text Book of Engineering Chemistry, 9th Edition, 2001, S. Chand & Company Limited.

Reference Books:

1. Atkins, Physical Chemistry, 7th edition P.W.
2. J.F. Shakelford, M.K.Murlidhara, Materials Science for Engineers, 6th Edition.
3. Bokris and Reddy, Modern Electrochemistry I, 2nd Edition, Springer.

ME-14.101 **Applied Mechanics** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): NIL

Objective(s):

- This course will help the student to acquire knowledge of basic engineering mechanics concepts and enhance their ability to solve open-ended engineering problems.
- To provide the student with a clear and thorough understanding of the theory and applications of engineering mechanics, covering both statics and dynamics.
- To provide the student with a thorough understanding of the concept, drawing, and the use of free-body diagrams.
- To be able to determine the Centre of Gravity and Moments of Inertia of simple geometric shapes and understand the physical applications of these properties.
- To understand the use and be able to perform calculations related to friction forces in engineering applications.

1. **Introduction:** Idealization of Mechanics, the concept of Rigid Body, External Forces (Body forces & surface forces), Laws of Mechanics. [3]
2. **Force Systems and Equilibrium**: Introduction to vector, Statically Equivalent Force systems, Free Body Diagram, Equations of equilibrium and their applications to the various system of forces. [8]
3. **Distributed Forces and Moment Of Inertia**: Centroid of Composite figures, Area Moment of Inertia, Mass Moment of Inertia, Principle axes and Principle Moment of Inertia. [5]
4. **Friction:** Introduction of friction, Laws of friction, wedge, screw, belt, rolling friction. [5]
5. **Tension, Compression, and Shear:** Normal stress and strain, Linear elasticity, Hooke's Law and Poisson's Ratio, Shear stress and shear strain, Relationship between modulus. [4]
6. **Beams:** Different support & load conditions, SFD, BMD [5]
7. **Kinematics of Particles**: Introduction, Rectilinear motion, Plane curvilinear motion, Rectangular coordinates, Tangential and normal coordinates, polar coordinates, Relative motion (Translating Axes), constrained motion of connected particles. [5]
8. **Kinetics of Particles:** Introduction, Force, Mass and acceleration, Newton's second law of motion, Equation of motion and solution of problems, Work and Energy, Impulse and Momentum. [5]

Outcome(s):

- The students shall develop the ability to identify, formulate, and solve engineering problems related to forces and motion.

Text Books:

1. Timoshenko, S, Young, D.H, Rao, J.V, Engineering Mechanics, 4th edition TMH, 2010.
2. Merian, J.L, Kraige, L.G., Engineering Mechanics Vol I & II, 5th edition Wiley India 2010.

Reference Books:

1. Hibbeler, Gupta R. C., Engineering Mechanics, 11th ed., Pearson India, 2010.
2. Irving. H. Shames, Engineering Mechanics, Prentice Hall Book Company, 1966.

EE-14.101 **Elements of Electrical Engineering** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): NIL

Objective(s):

- This course facilitates the students to get a comprehensive exposure to various concepts and devices of electrical engineering.

1. **Introduction:** Background, major inventions, scope, significance and job opportunities in electrical engineering, brief overview of various energy resources. Apparatus used in generation, transmission, and distribution of electrical power and various industries. [3]
2. **D.C. circuits:** Review of circuit elements, voltage sources, current sources, ohms law, KVL, KCL, source transformation, mesh current and node voltage analysis of circuits. [5]
3. **Network Theorems**: Superposition theorem, Thevenin's theorem, Norton's theorem, Maximum Power Transfer theorem, star-delta transformation. [6]
4. **Single phase A.C. circuits:** Basic terminologies, average & RMS values of a.c. quantities, phasor representation, the response of R, L, C and their combination to a.c. excitation, the concept of power and power factor in a.c. circuits. [6]
5. **Three phase A.C. circuits:** Three phase supply, phase sequence, star connection, delta connection, the relationship between phase and line quantities in 3-phase circuits, measurements of three-phase power underbalanced condition. [6]
6. **Magnetic Circuits & Transformer**: Magnetic circuit, mutually coupled circuit, Transformer: working principle, emf equation, ideal & practical transformer, equivalent circuits, transformer testing: open circuit and short circuit test, losses, voltage regulation and efficiency. [8]
7. **Rotating Machines:** Electro-mechanical energy conversion, introduction to rotating machines and applications [6]

Outcome(s):

- The students shall develop an insightful knowledge on various fundamental elements and devices of electrical engineering.

Text Books:

1. Nagrath & Kothari, Theory and Problems of Basic Electrical Engineering, 2nd edition PHI Publication.
2. Fitzgerald & Kingsley, Basic Electrical Engineering, 3rd edition TMH publication.

Reference Books:

1. H.Cotton, Advanced Electrical Technology, CBS Publication.
2. Vincent Del Toro, Electrical Engineering Fundamentals, 2nd Edition PHI Publication

EC-14.101 **Basics of Electronics Engineering** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): NIL

Objective(s):

- This course would facilitate the learner to acquire good exposure to electronics and communication engineering.

1. **Introduction:** Brief history of major inventions, scope, significance and job opportunities in electronics and communication engineering, Overview of various specializations in ECE, Electronic test and measurement equipment's, Specifications for electronic components. [3]
2. **Semiconductors:** Material and its properties, Formation of energy band diagram, Currents in semiconductors, Fermi-Dirac energy distribution, Types of semiconductors – Intrinsic and Extrinsic, Mass action law, Hall effect. [5]
3. **Diodes:** Introduction, Characteristic of ideal and real diode, Current components in the diode, load characteristics, Breakdown in the diode, Zener diode, Varactor diode, Tunnel diode, Clippers and Clampers, Rectifiers – Half and Full-wave rectifiers. [8]
4. **Transistors:** Introduction to PNP and NPN transistors, current components, active, cutoff and saturation regions, CC, CB and CE configuration, Operating point, Biasing circuits, Bias Stability, Thermal runway and thermal stability. [8]
5. **Signals:** Definition, Classification of signals – Analog and Digital, Deterministic and Random signals, Power and Energy of signals, Bandwidth, Bit and Baud rate. [4]
6. **Basics of Communication**: Definition, Block representation of communication system, Modulation – Definition, Need for modulation, Frequency translation, Types of modulation - Analog and Digital, Multiplexing – TDM and FDM. [6]
7. **Applications of Communication**: Introduction to - Optical Fiber, Transmission line, Waveguides, Satellite communication, and RADAR. [6]

Outcome(s):

- The learners are expected to have an overview of electronics and communication engineering and learn the introductory concepts in each of the specializations in ECE.

Text Books:

1. George Kennedy, Bernard Davis, Electronics Communication Systems, 3rd Edition, Tata McGraw-Hill, 2007.
2. Behrouz Forouzan, Data Communication, and Networking, 4th Edition, McGraw-Hill, 2006.
3. Robert L. Boylestad, Louis Nashelsky, Electronics Devices and Circuits Theory, 10th Edition, Prentice Hall, 2009.

Reference Books:

1. David A. Bell, Electronics Devices, and Circuits, PHI, 4th edition, 2008.
2. Wayne, Tomasi, Advanced Electronic Communication Systems, 6th edition, PHI, 2013.

CS-14.101 **Programming Language** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): NIL

Objective(s):

- To learn principles of programming by the structured native language 'C'.
- To comprehend the rudiments, constructs, syntax, and statements with essentials of efficient compiling, running and debugging processes.

1. **Introduction:** The role of programming languages, programming paradigms, language description and syntax structure, basics of structured programming, object-oriented programming, functional programming, logic programming, concurrent programming. [10]
2. **Fundamentals of 'C' language** : Character set, variables data types constants, arithmetic, relational and logical operators, type conversion, increment, decrement, bitwise and assignment operators, conditional expressions, statements and blocks, *if-else*, *switch*, loops - *do-while*, *while*, *for*; *break, continue* and *goto* statements, labels. [10]
3. **Functions, pointers and Arrays**: Basics of functions, automatic, external, static and register variables, scope rules, and header files, recursion and C preprocessor, arrays, pointers and addresses, pointers and arrays address arithmetic, character pointers and functions, pointer arrays, pointers to functions, pointers and multidimensional arrays, command line arguments. [10]
4. **Structures, unions and file processing:** Basics of structures, structures, and functions, arrays of structures, pointers to structures, self-referential structures, unions, bit fields, the concept of files, standard input and output, formatted output, file access in different modes, reading from and writing to a file. [10]

Outcome(s):

- Students would be able to apply learning and knowledge of C language analytically, critically and logically to solve mathematical, scientific and real-life problems in an efficient manner.

Text Books:

1.Brain W. Kernighan and Dennis M. Ritchie, The C Programming Language, Second edition, Pearson Education, 2013,
2.Ravi Sethi & K.V.Viswanatha, Programming Languages-Concepts, and Constructs, Second edition, Pearson Education,2013,

Reference Books:

1.Herbert Schildt, C: The Complete Reference, Fourth Edition, McGraw-Hill Education, 2000
2.E Balagurusamy, Programming in ANSI C, Tata McGraw - Hill Education

ME-14.111 **Computer Aided Engineering Drawing** **Total Lectures: 40**

Credit: 0-0-4-2

Prerequisite(s): NIL

Objective(s):

- To improve the visualization skills.
- To enable the students with various concepts like dimensioning, conventions and standards related to working drawings in order to become professionally efficient.
- To impart the knowledge of understanding and drawing of simple engineering products.

1. **Introduction to Computer Aided Sketching**: Introduction, Drawing Instruments and their uses, BIS conventions, Lettering, Dimensioning and freehand practice. Board Drawing vs. Computer- Aided Drawing. Introduction to Solid works Environments. Computer screen, the layout of the software, standard toolbar/menus and description of most commonly used toolbars, navigational tools. Co-ordinate system and reference planes. Definitions of HP, VP, RPP &LPP. Creation of 2D/3D environment. Selection of drawing size and scale. Commands and creation of Lines, Co-ordinate points, axes, dimensioning, line conventions, material conventions and lettering. [8]
2. **Orthographic Projections**: Horizontal planes, Vertical planes, Front view, Top view, Side view, Projections, the First and Third angle of projection, Projections of points, Principles of orthographic projections, Sketching of different views of given objects. Introduction to sketching in Solid works : 2-Dimensional Sketching, Sketching in Solid works, poly-lines, square, rectangle, polygons, splines, circles, ellipse, text, move, copy, off-set, mirror, rotate, trim, extend, break, chamfer, fillet, curves, constraints viz. tangency, parallelism, inclination, and perpendicularity. [12]
3. **Projections of Lines, Planes, and Solids**: Lines inclined to both the principal planes, the projection of Lamina inclined to both principal planes, Projections of solids: Axis inclined to both the reference planes and Intersection of solids. Introduction to the part module in Solid works: Extrude, Revolve, Sweep, Hole, Filleting, and Chamfering features. [12]
4. **Sections of solids and sectional orthographic views:** Sectional orthographic projections - Full, Half, Partial, revolved and removed surfaces. Introduction to drawing module in Solid works: Standard 3 views, Auxiliary view, Section View, Projected view. [12]
5. **Isometric Projection:** Terminology, Isometric scale, Box method, Coordinate or offset method, Four-center method, the isometric projection of arcs. Solid models practice using Solid works part module. [8]

Outcome(s):

- Students will be able to improve their visualization skills so that they can apply these skills in developing new products.
- Students will be able to know and understand the conventions and the methods of engineering drawing using Solid works.
- Students will be able to prepare simple drawings of engineering products.

Text Books:

1. N.D. Bhatt, "Engineering Drawing", Charotar Publishing House, 2013.
2. Prof. Sham Tickoo, Sandeep Prem Dass Solid works 2013 for Engineers and Designers Wiley Publication, 2013.

Reference Books:

1. Randy H. Shih, Solid works 2013 and Engineering Graphics: An Integrated Approach, SDC Books: Publications. 2013
2. David Planchard, "Engineering Graphics with Solid Works 2014 and Video Instruction", SDC Publications, 2013.

CS-14.111 **Programming Lab** **Credit: 0-0-2-1**

Prerequisite(s): NIL

Objective(s):

- To learn the implementation of programming language.

1. **C- Language Basics**: 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.
2. **Control Statements**: 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.
3. **Functions:** 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.
4. **Arrays:** 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.
5. **Pointers:** 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.
6. **Structure and Union**: 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.
7. **I/O and File Structure**: 5 application programs are to be written for the above elements in different areas of computing like-Science, Business, Mathematics and other manual processes.

Outcome(s):

- The students will be able to implement efficiently the logic into a program.

PY-14.111 **Physics Lab** **Credit: 0-0-2-1**

Prerequisite(s): NIL

Objective(s):

- To make the students gain practical knowledge to co-relate with the theoretical studies.

1. To study the material constant, temperature coefficient of current and Planck's constant.
2. To determine the specific resistance of a given wire by using the Carey Foster's bridge.
3. To determine the ballistic constant, K of a moving coil ballistic galvanometer with a standard capacitor of known capacity.
4. To determine the high resistance by the method of leakage of a condenser with the help of ballistic galvanometer.
5. To study the variations of resistivity with temperature and hence determines the energy band gap of the given semiconductor with help of four probe method.
6. To convert a galvanometer into a voltmeter of a given range.
7. To convert a galvanometer into an ammeter of a given ranges.
8. To plot graph showing the variation of magnetic field with distance along the axis of a circular coil carrying current and to estimate from it the radius of the coil.

Outcome(s):

- After completion of the course, students would be able to develop the skills necessary to perform experiments in physics and acquire an experience of the methods used and analysis needed in experimental physics.

CY-14.111 **Chemistry Lab** **Credit: 0-0-2-1**

Prerequisite(s): NIL

Objective(s):

- To provide students with practical knowledge of quantitative analysis of materials by classical and instrumental methods for developing experimental skills in building technical competence.

1. To determine the Total, Temporary and permanent hardness of water by EDTA method.
2. To determine the % of available chlorine in a sample bleaching powder.
3. To determine the alkalinity of given water sample.
4. To prepare urea formaldehyde resin.
5. To determine the Calorific value of a fuel by bomb calorimeter.
6. Determination of the strength of HCl by titrating it against NaOH pH metrically.
7. Determination of the strength of HCl by titrating it against NaOHconductometrically.

Outcome(s): On completion of this course, students will have the knowledge in

- Handling different types of instruments for analysis of materials using small quantities of materials involved for quick and accurate results.
- Carrying out different types of titrations for estimation of concerned in materials using comparatively more quantities of materials involved for good results.

ME-14.112 **Mechanical Workshop** **Credit: 0-0-2-1**

Prerequisite(s): NIL

Objective(s):

- To learn various hand tools used in fitting, carpentry and sheet metal shop.
- To learn about lathe and drilling machine and their operations.
- To learn how various joints are made using wood and other metal pieces.

1. **Fitting Shop:** Prepare job that contains various fitting operation like filing, marking, measuring, cutting, drilling etc.
2. **Carpentry Shop:** Making of carpentry joint (T, L joint etc).
3. **Sheet Metal Shop:** Making job from the sheet (funnel, tray etc).
4. **Machine Shop:** Perform various operations like turning, step turning, facing, chamfering, knurling etc. on Lathe.

Outcome(s): Students will able to:

- Understand use of tools of Fitting, Carpentry & Sheet Metalworking operations
- Study and practice on lathe and drilling machine and their operations
- Acquire engineering skills in Fitting, Carpentry & Sheet Metalworking operations

EE-14.111 **EEE Lab** **Credit: 0-0-2-1**

Prerequisite(s): NIL

Objective(s):

- The objective of this course is to introduce the students to the basic concepts of Electronics Engineering.
- The aim of this course is to study the fundamental aspects of Electronics Engineering.
- To acquire the knowledge of hardware and verify the results on Multisim software.
- This lab facilitates the students to get a comprehensive exposure to operations of AC and DC machines, measurements of various parameters and applications of electrical machines.

Practical to be performed on Hardware:

1. Introduction to basic electronics components and study of breadboard, CRO, function generator, multimeter, and D.C. power supply.
2. To plot VI characteristics of p-n junction diode and Zener diode.
3. To design a half wave rectifier with and without filter circuit and find the ripple factor.
4. To design a full wave rectifier with and without filter circuit and find the ripple factor.
5. Study of clipper and clamper circuits and implement on a breadboard.
6. To perform soldering and de-soldering to make a banana probe, BNC probe, and connection on PCB.
7. To conduct open circuit test and short circuit test on single phase transformer and to determine equivalent circuit parameters.
8. Measurement of three-phase power by using two wattmeter methods.
9. Speed control of DC machine by field current control method.
10. To construct a fluorescent tube wiring and to measure the voltage across tube rod, the voltage across choke and current.

Practical to be performed using Multi-Sim Software:

1. An Introduction to Electronic Circuit Simulation using **Multi-Sim Software**.
2. To verify Ohm's law and Kirchhoff's law.
3. Simulate half wave and full wave bridge rectifier.
4. To plot VI characteristics of p-junction diode

Outcome(s): After completion of the course, students would be able to:

- To use the technique, skills, and modern engineering tools necessary for engineering practice.
- Able to explain the basic concepts of basic electronics components.
- Able to describe& explain Clipper and Clamper circuits, V-I Characterization of p- n junction & Zener diode.
- The students shall develop an insightful knowledge on various ac and dc machines with their industrial applications.

Code ME 14.201 **Mechanics of Solids** **Total Lectures: 40**

Credit 3-1-0-4

Prerequisite(s): ME-14.101, MA-14.101

Objective(s):

- *To acquaint with the basic concepts of stress and deformation in solids.*
- *To practise the methodologies to analyse stresses and strains in simple structural members, and to apply the results in simple design problems.*
- *Learn the fundamental concepts of the method of superposition, flexibility method, and stiffness method as applied to problems involving statically determinate and indeterminate axial and torsional members, and beams.*
- *Understand the concepts necessary to design the structural elements and pressure vessels.*

1. **Compound Stress and Strains:** Introduction, objective of the course, stresses on inclined sections, strain energy, impact loads and stresses, state of plane stress, principal stress and strain, maximum shear stress, Mohr's stress circle, three dimensional state of stress & strain, generalized Hook's law. **[6]**
2. **Shear Forces and Bending Moment in Beams:** Axial force, shear force and bending moment diagrams for statically determinate (uniform and variable loading) beams including beams with internal hinges for different types of loading. **[4]**
3. **Trusses:** Introduction, simple truss and solution of simple truss, method of joints and method of sections. **[4]**
4. **Stresses in Beams:** Pure Bending**,** normal stresses in beams, shear stresses in beams due to transverse and axial loads, composite beams. **[4]**
5. **Deflection of Beams:** Equation of elastic curve, cantilever and simply supported beams, Macaulay's method, area moment method, fixed and continuous beams, combined bending & torsion of solid & hollow shafts. **[6]**
6. **Columns and Struts:** Buckling and stability, slenderness ratio, combined bending and direct stress, struts with different end conditions, Euler's theory for pin ended columns, effect of end conditions on column buckling, Rankine Gordon formulae, examples of columns in mechanical equipments and machines. **[8]**
7. **Thin cylinders:** Introduction, difference between thin walled and thick walled pressure vessels, Thin walled cylinders, hoop and axial stresses and strain, volumetric strain. **[4]**
8. **Curved Beams:** Bending of beams with large initial curvature, position of neutral axis for rectangular and circular cross sections, stress in crane hooks, stress in circular rings subjected to tension or compression. **[4]**

Outcome(s):

- *Understand the fundamental concepts of stress and strain and the relationship between both through the strain-stress equations in order to solve problems for simple tri-dimensional elastic solids.*
- *Solve problems relating to pure and non-uniform bending of beams and other simple structures.*
- *Solve problems relating to torsional deformation of bars and other simple tri-dimensional structures.*
- *Understand the concept of buckling and be able to solve the problems related to isolated bars.*

Code ME 14.203

Engineering Thermodynamics

Total Lectures: 40

Credit: 3-1-0-4

Prerequisite(s): MA 14.101, MA 14.102

Objective(s):

- *Identify and use units and notations in thermodynamics*
- *State and illustrate the first and second laws of thermodynamics*
- *Identify and explain the concept of entropy, enthalpy, specific energy, reversibility and irreversibility*
- *Apply the first and second laws of thermodynamics to formulate and solve engineering problems for (i) closed systems, (ii) open systems, and (iii) power cycles*
- *Ability to understand and effectively communicate the fundamentals of thermodynamic analyses and to articulate the basic environmental, economic, and sustainability considerations to the non-thermodynamicist*
- *Use thermodynamic tables, charts, and equation of state (e.g. the ideal gas law) to obtain appropriate property data to solve thermodynamics problems*

1. **Basic Concepts and Definitions:** Introduction and definition of thermodynamics, dimensions and units, microscopic and macroscopic approaches, systems, surroundings and universe, concept of continuum, control system boundary and control surface, properties and state, thermodynamic properties, thermodynamic path, process and cycle, thermodynamic equilibrium, reversibility and irreversibility, quasi static process, energy and its forms, work and heat, gas laws, ideal gas, real gas, law of corresponding states, Dalton's law, Amagat's law, property of mixture of gases, zeroth law of thermodynamics, temperature and its measurement, temperature scale. **[4]**
2. **First Law of Thermodynamics:** Thermodynamic definition of work, thermodynamic processes, calculation of work in various processes and sign convention, non-flow work and flow work, Joule's experiment, first law of analysis for closed system (non- flow processes), analysis of unsteady processes such as filling and evacuation of vessels with and without heat transfer, first law of thermodynamics applied to open systems, steady flow systems and their analysis, steady flow energy equations, boilers, condensers, turbine, compressors, pumps throttling process etc., PMM-I. **[6]**
3. **Second Law of Thermodynamics:** Limitations of first law of thermodynamics, devices converting heat into work, thermal reservoir, heat engines, efficiency, devices converting work into heat, heat pump, refrigerator, coefficient of performance, reversed heat engine, Kelvin Plank statement of second law of thermodynamics, Clausius statement of second law of thermodynamics, equivalence of two statements of second law of thermodynamics, reversible and irreversible processes, Carnot cycle, Carnot engine, Carnot theorem and its corollaries, thermodynamic temperature scale, PMM-II. **[6]**
4. **Entropy:** Clausius inequality, concept of entropy, entropy change in different processes, Tds equation, principle of increase in entropy, T-S diagram, statement of third law of thermodynamics, entropy and disorder, concept of exergy, available and unavailable energy, availability and irreversibility, second law efficiency. **[7]**

5. **Thermodynamic Relations:** Thermodynamic variables, Independent and dependent variables, Maxwell's thermodynamic relations, Thermodynamic relations involving entropy, Thermodynamic relations involving enthalpy and internal energy, Joule-Thomson coefficient, Clapeyron equation**.** **[4]**

6. **Properties of Steam**: Pure substance, property of steam, triple point, critical point, sub-cooled liquid, saturation states, superheated states, phase transformation process of water, graphical representation of pressure, volume and temperature, P-T & P-V diagrams, T-S and H-S diagrams, use of property diagram, steam-Tables &Mollier charts, dryness factor and it's measurement, processes involving steam in closed and open systems. **[6]**

7. **Vapour & Gas Power cycles**: Carnot cycle, Rankine cycle, comparison of Carnot and Rankine cycle, modified Rankine cycle, calculation of cycle efficiencies, variables affecting efficiency of Rankine cycle. Carnot, Otto, Diesel, dual, Atkinson and Brayton cycle. Comparison of Otto, Diesel and dual cycles, calculation of air standard efficiencies, mean effective pressure, brake thermal efficiencies, relative efficiencies of I.C. engine. **[7]**

Outcome(s):

- *Understand the thermodynamics implication and thermodynamics explanation for the states of matter.*
- *Understand and apply basic energy conservation equations for kinetic, potential and flow energies.*
- *Understand the concepts of enthalpy, entropy and the basic laws of thermodynamics.*
- *Understand and solve thermodynamic cycle problems, including the Carnot ideal cycle, the Otto cycle, the Diesel Cycle, Rankine and Brayton*
- *Understand thermodynamic tables, charts, and equation of state (e.g. the ideal gas law) to obtain appropriate property data to solve thermodynamics problems*

Code ME14.205

Material Science and Metallurgy

Total Lectures: 40
Credit: 3-0-0-3

Prerequisite(s): PY-14.101,CY-14.101

Objective(s):

- *To acquaint students with the basic concepts and properties of Material Science.*
- *To impart the knowledge on mechanical behavior of materials.*
- *To acquire knowledge in various class of materials (like Ferrous, Non-Ferrous Alloys and Advanced Materials) and their applications.*
- *To impart knowledge on Heat Treatment, Microstructure and Phase diagrams.*
- *To acquire knowledge in destructive and non-destructive testing of materials.*

1. **Introduction to Engineering Material & Material Structure:** Development in materials science, introduction to engineering materials classification of material, crystal structures (BCC, FCC and HCP systems), imperfections in crystals - point defects, line defects, surface and bulk defects, slip, twinning. **[5]**
2. **Phase diagrams:** solid solutions, binary alloy system, lever rule, Iron-carbon equilibrium diagram, TTT diagrams**.** **[7]**
3. **Heat Treatment:** Annealing, normalizing, tempering, hardening (case hardening and surface hardening). **[5]**
4. **Ferrous & Non Ferrous Metals:** Allotropy of Iron, types of ferrous metals, alloy steels, tool steels, stainless steels, cast irons, effect of alloying elements on mechanical properties of steel, designation of steels and cast iron. copper and its alloys – properties, brasses, bronzes, copper- nickel alloys, aluminium and their alloys – corrosion resistance, magnesium, titanium, bearing materials. **[7]**
5. **Polymers, Ceramics and Composites:** Mechanical behavior of polymers, crystallization, melting and glass transition, polymer types, polymer synthesis and processing; ceramics – crystal structures and properties, composites - particle reinforced composites, fiber reinforced composites, structural composites, nanoparticle composites. **[6]**
6. **Mechanical Properties and their Testing:** Destructive Testing**-**tensile test, engineering stress-strain curve, true stress-strain curve, types of stress-strain curves, compression test, formability, hardness testing, different hardness tests- Vickers, Rockwell, Brinell, impact test, ductile and brittle fracture, creep, generalized creep behaviour. non-destructive testing (NDT)- visual Inspection, magnetic particle inspection, dye penetrant inspection, ultrasonic inspection, Selection of NDT. **[10]**

Outcome(s):

- *The students will be enhancing their knowledge of materials &their applications.*
- *Students will be able to design the alloy system of ferrous and non-ferrous metals based on their knowledge of phase diagrams and metal characteristics.*
- *The students will also be able to understand the heat treatment processes and destructive and non-destructive testing of materials.*

Text Books:

1. V. Raghavan, "Material Science & Engineering", Prentice Hall India Ltd., Latest Edition.
2. A. K. Bhargava, C.P. Sharma. "Mechanical Behavior & Testing Of Materials", PHI

Learning Private Ltd.

2. Dieter G. E, "Mechanical Metallurgy", McGraw Hill Publishing Co., New York, Latest Edition.
3. Hajra Choudhury S. K, "Materials Science and Processes", Indian Book Distributing Co., Latest Edition.
4. Material Science and Engineering; I.P. Singh, Subhash Chander; 12th Edition, 2014 Jain Publishers, Delhi.

MA 14.201 **Applied Mathematics** **3-1-0-4**

Total Lecture: 40

Objective: To acquire fundamental knowledge of linear programming, numerical methods, complex analysis and integral transform and apply in engineering disciplines.

1. Linear Programming: Introduction**,** Graphical method (bounded & unbounded solutions); Simplex method, Artificial variable technique (Two phase method, Big –M method); Assignment problem (Hungarian method); Transportation problem (Vogel's approximation method). **[12]**

2. Numerical Methods: Solution of system of equations (Gauss elimination and Gauss - Seidel methods); Solution of algebraic and transcendental equations (Bisection, Ramanujan's and Regula Falsi methods); Solution of ordinary differential equation (Euler's modified, Milne's predictor & corrector Runge-Kutta methods). **[10]**

3. Complex Analysis: Function of complex variable, analytic function, Cauchy- Riemann equations(without proof), integration of complex functions, line integrals in the complex plane, Cauchy integral theorem(without proof), Cauchy integral formula(without proof), zeros and singularities of complex functions, residues. **[06]**

4. Integral Transform: Laplace transform and inverse Laplace transform First and Second Shifting theorems, Convolution theorem (without proof), Solution of ordinary differential equations with initial conditions by Laplace transforms. Fourier series of periodic functions, even and odd functions, Fourier half-range series; Basics of Fourier transforms. **[12]**

Outcome: After completion of the course, students would be able to apply the knowledge of linear programming , numerical methods ,complex analysis and integral transforms in engineering and solve curriculum problems.

Code ME14.211

Mechanics of Solids Laboratory

Total Hours: 24
Credit: 0-0-2-1

List of Experiments

1. To determine the Impact toughness (strain energy) through Izod test. **[2]**
2. To determine the Impact toughness (strain energy) through Charpy test. **[2]**
3. To determine the tensile strength of specimen using Universal Testing Machine. **[4]**
4. To find the modulus of rigidity using torsion testing equipment. **[2]**
5. To find the values of bending stresses and Young's modulus of the material of a beam (say a wooden or steel) simply supported at the ends and carrying a concentrated load at the centre using Universal Testing Machine **[2]**
6. To find the shear strength of given specimen using Universal Testing Machine. **[4]**
7. To find the compressive strength of given specimen using Universal Testing Machine. **[4]**
8. To determine the stiffness of the spring and modulus of rigidity of spring wire using spring testing machine. **[4]**

Code ME14.213 **Thermodynamics Laboratory** **Total Hours: 24**
Credit: 0-0-2-1

List of Experiments

1. To measure temperature using different types of measurement devices and compare the measurement methods for accuracy and ease of use. **[10]**

    a. J and K type thermometer
    b. NTC thermistor
    c. PT 100 platinium resistance thermometer (four wire)
    d. 2 x liquid in glass thermometers
    e. Bimetal and gas (vapour) pressure thermometer

2. To measure the humidity using different type of humidity measurement devices and compare the measurement methods for accuracy and ease of use. **[6]**

    a. Hair hygrometer
    b. Wet and dry bulb hygrometer
    c. Whirling hygrometer

3. To study and determine the various properties of steam with steam generator **[8]**

Code ME14.215 **Computer Aided Machine Drawing** **Total Hours: 24**

Credit: 0-0-2-1

1. **Drawing Standards:** Code of practice for engineering drawing, bis specifications–welding symbols, riveted joints, keys, fasteners. reference to hand book for the selection of standard components like bolts, nuts, screws, keys etc. **[4]**

2. **2-D Drawings:** Limits, Fits -Tolerancing of individual dimensions, specification of fits, manual preparation of production drawings and reading of part and assembly drawings. **[8]**

3. **CAD Practice:** Drawing, Editing, dimensioning, plotting commands, layering concepts, hatching, detailing, assembly, basic principles of GD&T (geometric dimensioning & tolerancing) **[4]**

4. **Assembly Drawing (using CAD software):** Manual parts drawing and preparation of assembled views given part details for components followed by practicing the same using CAD packages. **[8]**

   Suggested Assemblies: Shaft couplings, plummer block, screw jack, lathe tailstock, universal joint, machine vice, stuffing box, safety valves, non return valves, connecting rod, piston and crank shaft, multi plate clutch. preparation of bill of materials

Text Books:

1. P. S.Gill, 'Machine Drawing', S K Kataria and Sons, 2012.
2. Prof. Sham Tickoo, Sandeep PremDass "Solidworks 2013 for Engineers and Designers" Wiley Publication, 2013.

Reference Books:

ME 14.202 **Kinematics of Machines** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): ME 14.101

Objective(s):

- *To provide basic concept of kinematics and kinetics of machine elements.*
- *Know different machine elements and mechanisms.*
- *Select Suitable Drives and Mechanisms for a particular application.*
- *Develop ability to come up with innovative ideas.*

1. **Basics Of Mechanisms:** Terminology and definitions - degree of freedom mobility, Kutzbach criterion, Grashoff's law, kinematic inversions of 4-bar chain and slider crank chains, mechanical advantage, transmission angle, description of common mechanisms-single, double and offset slider mechanisms, quick return mechanisms, straight line mechanism. **10**

2. **Kinematics:** Displacement, velocity and acceleration analysis in simple mechanisms-Graphical Method of velocity and acceleration analysis for different mechanisms-instantaneous centre of velocity - angular velocity ratio theorem. coriolis acceleration. Three-dimensional kinematics and kinetics of rigid bodies: translation, rotation about a fixed point, general motion, angular momentum, kinetic energy, momentum equation. **10**

3. **Kinematics Of Cam:** Classifications, displacement diagrams, parabolic simple harmonic and cycloidal motions, layout of plate cam profiles, derivatives of follower motion, high speed cams, circular arc and tangent cams, standard cam motion, pressure angle and undercutting. **10**

4. **Gears:** Spur gear terminology and definitions, fundamental law of toothed gearing and involutes gearing, inter changeable gears, gear tooth action, terminology, interference and undercutting , non-standard gear teeth , helical, bevel, worm, rack and pinion gears (basics only), gear trains , parallel axis gear trains, epicyclic gear trains, differentials , automotive transmission gear trains. **10**

Outcome(s):

- *Identify mechanisms and predict their motion*
- *Calculate the degrees of freedom of mechanisms.*
- *Draw velocity and acceleration diagrams of various mechanisms.*
- *Construct CAM profile for the specific follower motion.*
- *Select appropriate power transmission mechanism.*

ME 14.204 **Total Lectures: 40**

Fluid Mechanics

Credit 3-1-0-4

Prerequisite(s): ME 14.101

Objective(s): *This course deals with the understanding of the physical mechanisms and the mathematical models of fluid mechanics. The objectives of the course is to enable the student;*

- *To know properties of fluid.*
- *To calculate hydrostatic forces on submerged surfaces.*
- *To apply Bernoulli equations.*
- *To calculate friction losses in pipes.*
- *To apply conservation of mass, momentum & energy principle.*
- *To apply boundary condition for different conditions.*

1.	**Introduction:** Physical properties of fluids, concept of shear stress, Newtonian and Non-Newtonian fluids	**2**
2.	**Fluid Statics:** Pressure-density-height relationships, manometers, force on plane and curved surfaces, center of pressure, buoyancy, stability of immersed and floating bodies, fluid masses subjected to uniform acceleration and uniform rotation about the axis.	**6**
3.	**Kinematics Of Fluid Flow:** Types of fluid flow, stream lines, streak lines, path lines, stream tubes, stream function and velocity potential, flow nets	**5**
4.	**Dynamics Of Fluid Flow:** Euler's equation of motion along a streamline and its integration, Bernoulli's equation and momentum equation. Boundary Layer Analysis, Boundary Layer Thickness, Boundary Layer over a flat plate.	**5**
5.	**Dimensional Analysis And Hydraulic Similitude:** Dimensional analysis, Buckingham's pi theorem, important dimensionless numbers and their significance, geometric, kinematic and dynamic studies.	**5**
6.	**Flow Past Immersed Bodies:** Lift and drag, expressions for lift and drag	**4**
7.	**Flow Through Pipes:** Laminar and turbulent flow in pipes, general equation for head loss-Darcy-Weisbach and Fanning's equations, Moody's diagram, energy losses through pipe fitting, flow through network of pipes, power transmission through pipelines.	**6**
8.	**Fluid Flow Measurements:** Introduction, venturimeter, orificemeter, Pitot tube, notches and weirs.	**5**
9.	**Introduction To Compressible Flow:** Velocity of sound in a fluid, Mach number, propagation of pressure waves in a compressible fluid	**2**

Outcome(s):

- *An understanding of fluid mechanics fundamentals, including concepts of mass and momentum conservation.*
- *An ability to apply the Bernoulli equation to solve problems in fluid mechanics.*
- *An ability to apply control volume analysis to problems.*
- *An ability to use potential flow theory to solve problems.*
- *An ability to perform dimensional analysis for problems.*
- *Knowledge of laminar and turbulent boundary layer fundamentals.*

Text Books:

1. Som S and Biswas G, "Introduction to Fluid Mechanics and Fluid Machines", 2nd ed., Tata McGraw-Hill, 2007.
2. Douglas J. F, Gasoriek, J. M, Swaffield, J. and Jack, L, "Fluid Mechanics" 5th ed., Pearson Education, 2008

Reference Books:

1. Young D. F, Munson B, Okiishi T. H and Huebsch W. W, "Fundamentals of Fluid Mechanics", 6th ed., John Wiley, 2009.
2. Clayton T. C, Donald F. N, Roberson J. A and Williams B. C, "Engineering Fluid Mechanics", 9th ed., John Wiley, 2008.
3. Cengal Y and Cimbala J, "Fluid Mechanics", 6th ed., Tata McGraw Hill, 2010.

ME 14.206 **Design of Machine Elements - I** **Total Lecture 40**

Credit: 3-0-0-3

Prerequisite(s): ME 14.101, ME 14.201

Objective(s):

- *Develop an ability to apply knowledge of mathematics, science, and engineering*
- *To develop an ability to design a system, component, or process to meet desired needs within realistic constraints.*
- *To develop an ability to identify, formulate, and solve engineering problems.*
- *To develop an ability to use the techniques, skills, and modern engineering tools necessary for engineering practice*.

1. **Introduction:** Engineering design - an applied decision theory with respect to functional requirements, aesthetic consideration and ergonomic consideration-traditional design methods-synthesis in design, standardization, preferred numbers, derived series of preferred numbers, types of Fits, tolerance with respect to Indian standard, calculation examples, interchangeability, surface Roughness and its designation on drawing. **4**

2. **Design against Static Load:** Factor of safety, design of simple machine parts, design of Cotter Joint, knuckle Joint and Hooke's Joint, theories of Failures, maximum principal stress theory, maximum shear stress theory, distortion-energy theory of failures. **6**

3. **Design against Fluctuating Load:** Methods to reduce stress concentration. Fluctuating stresses, fatigue failure, endurance limit, low cycle and high cycle fatigue, notch sensitivity, reversed stress-design for finite and infinite life, cumulative damage in fatigue, Soderberg and Goodman lines, modified Goodman's diagram, Gerber equation, fatigue design under combined stresses. **5**

4. **Shaft, Keys and Couplings:** Transmission shafts, shaft design on strength basis, shaft design on torsional rigidity bases, ASME code for shaft design, design of hollow shaft, design of keys, design of couplings- muff coupling, rigid flange coupling, flexible coupling, design of shaft for lateral rigidity, Castigliano's theorem, area moment method. **6**

5. **Welded & Riveted Joints:** Design of riveted joints and simple welded connections under concentric loads only, eccentric load in plane of weld, welded joints subjected to bending moment, Welded joints subjected to torsional moment, welded joints subjected to fluctuating forces. **4**

6. **Threaded Joints:** Basic type of screw fastening, terminology of screw thread, ISO metric screw thread, materials and manufacture, simple analysis of bolted joints, eccentrically loaded bolted joints in shear, eccentric load perpendicular to the axis of the bolt, eccentric load circular base, elastic analysis of bolted joints, bolted joints under fluctuating load. **5**

7. **Power Screw:** Forms of threads, multiple threaded screws, terminology of power screw, torque requirement for lifting of load and for lowering of load, self-locking screw, design of screw jack, differential and compound screws. **4**

8. **Springs:** Types of springs, style of end, stress and deflection equation, series and parallel connections, spring material, design of helical springs, concentric springs, multi-leaf spring, design of load spring. **6**

Outcome(s):

- *Be able to analyze the stress and strain on mechanical components; and understand, identify and quantify failure modes for mechanical parts.*
- *Demonstrate knowledge on basic machine elements used in machine design; design machine elements to withstand the loads and deformations for a given application, while considering additional specifications.*
- *Be able to approach a design problem successfully, taking decisions when there is not a unique answer.*

Text Books:

1. Bhandari V. B, "Design of machine elements", Tata McGraw Hill Publication, Latest Edition.
2. Shigley J. E, "Machine Engineering Design", Tata Mc Graw Hill Publication, Latest Edition.

Reference Books:

1. Norton R. L, "Machine design – An Integrated Approach", Tata McGraw Hill Publication, Latest Edition

ME 14.208 **Production Technology-I** **Total Lectures: 40**

Credit: 3-0-0-3

Prerequisite(s): **ME-14.112**

Objective(s):

- *To analyze and understand the metal cutting phenomenon.*
- *To study the conventional machining processes such as lathe, drilling, milling, shaping.*
- *To select process parameters and tools for obtaining desired machining characteristic.*

1.	**Introduction to Manufacturing Processes:** Introduction to manufacturing, classification of manufacturing processes.	**2**
2.	**Metal Cutting Theory:** Introduction, tool materials, tool geometry, mechanics of metal cutting, tool failures, tool wear in metal cutting, tool life, cutting forces and power, machinability, cutting fluids.	**9**
3.	**Turning Operations:** Introduction, constructional features of a center lathe, cutting tools, operations performed on a center lathe, taper turning methods, thread cutting methods, special attachments, limitations of a center lathe, capstan and turret lathes, turret indexing mechanism, tool layout of turret and capstan machines, automatic lathes, tool layout for automatic lathes, machining time estimation.	**10**
4.	**Hole Making Process:** Introduction, constructional features of a drilling, types of drilling machines, drill geometry, mechanics of drilling process, reaming, boring, tapping, other hole making operations, machining time estimation, boring machine.	**6**
5.	**Milling Process:** Introduction, types of milling machines, constructional features of a milling, cutters, milling operations, dividing head, milling mechanics, machining time estimation, machining center	**9**
6.	**Reciprocating Machine Tools:** Introduction to shaper, planner, slotter and broaching	**4**

Outcome(s): *At the end of the course, the student will be able to understand working of lathe, shaper, planer, drilling, and milling and machines. Comprehend speed and feed mechanisms of machine tools. Estimate machining times for machining operations on machine tools. Be able to select proper metal removing processes for the typical application.*

Text Books:

1. Rao P. N, "Manufacturing Technology", Tata McGraw-Hill, Latest Edition.
2. Lindberg Roy A, "Processes and Materials of Manufacture", Fourth edition PHI Latest Edition.

Reference Books:

1. Mikell. P. Grover, Fundamentals of Modern Manufacturing, Pearson Publications Gerling, "All About Machine Tools", New Age International (P) Limited, sixteenth edition, 2000.
2. Chapman W. A. J, "Workshop Technology", Volume 1,2,3, CBS Publishers and distributors, Latest Edition.
3. Kalpakjian, S. and Steven R. Schmid , Manufacturing, Engineering & Technology, Pearson.

ME 14.210 **Automobile Engineering** **Total Lectures: 40**
Credit 3-0-0-3

Prerequisite(s): Nil

Objective(s):
- *To identify various automotive systems & subsystems*
- *To explain working & construction of various automotive systems & subsystems.*
- *To introduce students to engine auxiliary systems like heating, ventilation and air-conditioning.*

1. **Introduction** - Introduction of automobile, classification of automobile, parts of an automobile, performance of an automobile, tractive efforts. **4**
   Chassis - Introduction, classification of chassis, frame types & nomenclature of car body.
2. **Fuel Supply, Lubrication and Cooling System -** Fuel feed system in spark ignition engine, types, gravity & pump feed system, layout of spark ignition engine fuel pump system, function of each component. **10**
   Fuel supply system in compression ignition engine, layout, components, function, types, working & line diagram of common rail, individual pump system, fuel injectors, single orifice, multiple orifices.
   Engine friction, lubrication system, areas of heat flow in engines, temperature distribution and temperature profiles, cooling air and water requirements, cooling systems.
3. **Suspension, Wheels and Tyres** - Introduction, Macpherson struts, Ball joint and torsion bars, Electronic ride control and air suspension systems, Sonar shock absorber and active suspension system **10**
   Introduction, Requirement & types of wheels , wheel balancing, wheel alignment
   Introduction, requirements & types of tyre, tyre construction, tyre materials, tyre shape, tread patterns, tyre inflation pressure, causes of wear.
4. **Steering, Gears and Controls -** Purpose, function, general arrangements of steering systems, steering gears, steering ratio, drag link, power steering. **10**
   Clutch- Types, necessity, construction & working, torque-converters.
   Gear Box- Types of gear box, construction & working of constant mesh gear box, synchromesh gear box, propeller shaft & differential,
   Axle- Type of rear axles, front axles & their applications, stub axles
5. **Automotive Electrical & Auxiliary Systems -** Electrical circuit component, symbol and wiring diagrams, battery, starting motor, dynamo, alternators, lighting. **6**
   Auxiliary systems like heating, ventilation and air-conditioning.

Outcome(s):
- *Develop non-working models of automobile sub- systems*
- *Formulate steering, braking and suspension systems*
- *Select a suitable conventional and automatic transmission system*
- *Identify the usage of automotive systems & hybrid vehicles.*

ME 14.212 **Production Technology Laboratory –I** **Total Hours: 24**
Credit: 0-0-2-1

List of Experiments

1.	Study of center lathe machine.	**[2]**
2.	Job – I: Facing, Plain turning, Step turning, External taper turning, External threading, Knurling, Parting off.	**[4]**
3.	Job – II: Facing, Plain turning, Drilling, Boring, Internal threading. Mating with Job I	**[4]**
4.	Study of Shaper	**[2]**
5.	Job – III: To cut multi slots on shaper.	**[2]**
6.	Study of milling machine and calculation of indexing mechanism on Universal Dividing Head.	**[4]**
7.	Job IV: Slotting on milling machine.	**[2]**
8.	Job V: To cut gear teeth on milling machine using dividing head.	**[2]**
9.	Study of radial drilling machine and making of one job with different drilling and reaming operations	**[2]**

ME 14.214 **Fluids Mechanics Laboratory** **Total Hours: 24**
Credit: 0-0-2-1

List of Experiments

1. To Study Bourdon tube pressure gauge. **[2]**

2. To calibrate pressure gage. **[2]**

3. Study of Venturimeter. **[6]**

a. To measure complete static head distribution along a horizontal Venturitube.
b. To compare experimental results with theoretical results.
c. To measure the meter coefficient of discharge at various flow rates.

4. To study discharge over a notch. **[6]**

a. To investigate head against discharge over a notch.

5. To study friction loss in pipe . **[8]**

a. To investigate laminar and turbulent flow in pipe. .
b. To verify Poiseulle's Equation and the coefficient of viscosity for water in the laminar flow region.
c. To demonstrate and measure the change in friction factor from laminar to turbulent.

ME 14.216 **Design of Machine Elements Practice -I** **Total Hours: 24**
Credit: 0-0-2-1

List of Experiments

1.	Design and drawing of a cotter joint, knuckle joint, hooke's joint	**[4]**
2.	Application of theories of failure to design machine members subjected to combined loadings	**[2]**
3.	Design of machine elements against fluctuating loads.	**[2]**
4.	Design and drawing of rigid and flexible couplings.	**[4]**
5.	Design and drawing of a riveted joint & welded joint	**[4]**
6.	Design and drawing of threaded joints.	**[4]**
7.	Design and drawing of power screws.	**[2]**
8.	Design and drawing of springs.	**[2]**

ME 14.301 **Dynamics of Machines** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): ME 14.101, ME 14.202

Objective(s):

- *Understand Kinematics and Dynamics of different machines and mechanisms.*
- *To facilitate students to understand the function of flywheels, the concept of balancing of rotating and reciprocating masses.*
- *To understand the principles in mechanisms used for governing of machines*
- *To give awareness to students on the phenomenon of vibration and its effects.*

1. **Static and Dynamic force analysis:** Constraint and applied forces, static Equilibrium of two and three forces members, principle of virtual work, friction in mechanisms. Dynamic analysis of 4-bar linkage and slider-crank mechanism, velocity and acceleration of a piston, angular velocity and angular acceleration of connecting rod, Engine force analysis, Dynamically equivalent system, inertia of connecting rod, Inertia force in reciprocating engine, crank shaft torque. **[10]**
2. **Engine dynamics and flywheel:** Turning moment diagram of an I. C engine, Fluctuation of crankshaft-speed, flywheel and its effect on cyclic fluctuation of speed of an engine. **[4]**
3. **Balancing:** Static balancing & dynamic balancing, Balancing of several masses, rotating in different planes, Balancing of reciprocating mass, Balancing of in-line engine, Balancing of V-engines, Balancing of radial engines. **[8]**
4. **Governors:** types of governors, analysis of Watt, Porter , Prowell, Hartnell, Hartung governor, Sensitiveness of a governor, hunting, isochronisms and stability of a governor, effect and power of a governor, effect of friction on dynamics of governor. **[8]**
5. **Gyroscope:** Angular velocity, angular acceleration and gyroscopic torque, gyroscopic effect on aeroplanes, naval ships, two wheelers and four wheelers. **[4]**
6. **Mechanical Vibrations:** Types of vibrations, Single degree free & damped vibrations, Logarithmic decrement, Forced vibration of single degree system under harmonic excitation, vibration isolation. **[6]**

Outcome(s):

- *Students will have an understanding of static force relationships and inertia forces and their effect that exist in machines.*
- *Students will demonstrate the dynamics of flywheel and their motion.*
- *Analyse balancing of rotating masses in a single and several planes.*
- *Understand concepts of vibrations in various machineries, their harmful effects and remedies*

Text Books:

1. Shigley J. E and Uicker J. J, "Theory of Machines and Mechanisms", McGraw Hill, Inc., Latest Edition.
2. Rattan S. S, "Theory of Machines", Tata McGraw Hill Publishing Company Ltd., New Delhi, Latest Edition.

Reference Books:

1. Thomas B, "Theory of Machines", CBS Publishers and Distributors, Latest Edition.

2. Ghosh A and Mallick A. K, “Thoery of Mechanisms and Machines”, Affiliated East-West Pvt. Ltd., New Delhi, Latest Edition.
3. Bhave S., “Mechanical Vibration”, Pearson India Ltd., Latest Edition

ME14.303 **Design of Machine Elements -II** **Total Lecture 52**
Credit: 4-0-0

Prerequisite(s) ME14.101, ME 14.201, ME 14.206

Objective(s)

- *Develop an ability to apply knowledge of mathematics, science, and engineering*
- *To develop an ability to design a system, component, or process to meet desired needs within realistic constraints.*
- *To develop an ability to identify, formulate, and solve engineering problems.*
- *To develop an ability to use the techniques, skills, and modern engineering tools necessary for engineering practice.*

1. **Design of Gears:** Different types of gears – spur, helical, bevel and worm gears, Beam strength, wear strength, dynamics loads on gears, estimation of module based on beam strength and wear strength, Thermal consideration design of worm gears. **[14]**
2. **Friction Clutches:** Different types of clutches, torque transmitting capacity for multidisc clutches, cone clutches, centrifugal clutches, Friction materials for clutches lining, energy equation and thermal considerations. **[6]**
3. **Brakes:** different types of brakes, Energy equations, Design of block brake, Design of band brake, Design of disc brake, Thermal consideration. **[6]**
4. **Rolling Contact Bearings:** Types of rolling contact bearings, Selection of bearing type, Static load carrying capacity, Equivalent bearing load, Load life relationship, selection of bearing life, Selection of bearing from manufacture's catalogue, Selection of taper roller bearings, Design of cyclic loads and speeds lubrication of bearing contact bearings, Mounting of bearings. **[3]**
5. **Sliding Contact Bearing:** Basic mode of lubrication, Petroff's equation, Mckee's Investigation, Reynold's equation, Raimondi Boyd method, Bearing design-selection of parameters, Bearing materials and construction, selection of lubricant. **[6]**
6. **Miscellaneous Machine Elements:** Engine crank shaft, connecting rod, cylinder head, pressure vessels. **[5]**

Outcome(s)

- *Be able to analyze the stress and strain on mechanical components; and understand, identify and quantify failure modes for mechanical parts.*
- *Demonstrate knowledge on machine elements used in machine design; design machine elements to withstand the loads and deformations for a given application, while considering additional specifications.*
- *Be able to approach a design problem successfully, taking decisions when there is not a unique answer.*

Text Books:

1. Bhandari V. B, "Design of machine elements", Tata McGraw Hill Publication, Latest Edition.
2. Shigley J. E, "Machine Engineering Design", Tata Mc Graw Hill Publication, Latest Edition.

Reference Books:

1. Norton R. L, "Machine design – An Integrated Approach", Tata McGraw Hill Publication, Latest Edition

ME 14.305 **Heat and Mass Transfer** **Total Lectures: 40**

3-1-0-4

Prerequisite(s): MA 14.201,ME 14.203, ME 14.204

Objective(s):

- *Identify and understand the various mechanisms of heat and mass transfer that characterize a given physical system.*
- *Formulate models for heat conduction processes. Apply analytical and numerical methods to solve one- and two-dimensional conduction problems.*
- *Analyze and design complex heat transfer applications, such as heat exchangers.*
- *Combine thermodynamics and fluid mechanics principles to analyze heat convection processes.*
- *Integrate radiation aspects into real-world global heat transfer problems.*

1. **Basics Concepts:** Heat transfer in engineering, Mechanisms of heat transfer, temperature field and temperature gradient, conduction, convection and radiation heat transfer, concept of driving potential, combined mechanism of heat transfer. **2**

2. **Fundamental equations of conduction:** General different equation of heat conduction in Cartesian, cylindrical and spherical coordinate system, one dimensional steady state heat conduction, systems without internal heat generation, systems with variable thermal conductivity, composite systems, critical radius of insulation, Special one dimensional steady state situations – **heat generation, pin fins** **6**

3. **Multidimensional steady state conduction:** Introduction, Mathematical analysis of 2-D systems, graphical analysis of 2-D systems, electrical analogy for 2-D systems, Numerical method of solution for 2-D systems, three dimensional systems. **6**

4. **Transient heat conduction:** Introduction, systems with negligible internal resistance – lumped parameter method, systems with negligible surface resistance, heat flow in an infinitely thick plate, systems with finite surface and internal resistance. **5**

5. **Fundamental of convective heat transfer:** Introduction, convective heat transfer coefficient, basic equation, boundary layer concept, laminar heat transfer over flat plate, fully developed heat transfer through smooth pipes, the case of contact heat flux and constant wall temperature boundary condition, dimensional analysis, Correlation of heat transfer in turbulent flow, use of hydraulic diameter, free convection heat transfer phenomena, heat exchangers, Log mean temperature difference, Effectiveness and NTU. **9**

6. **Thermal Radiation:** Basic concept, Theory of thermal radiation, electromagnetic spectrum, Wien's displacement law, Stefan-Boltzmann equation, Concept of black gray bodies without participating media, radiation shields, View factors, Equivalent emissivity of grooved surfaces electrical network analogies. **9**

7. **Mass Transfer**: Analogy between heat and mass transfer, mass diffusion, Fick's law of diffusion, boundary conditions, steady mass diffusion through a wall, transient mass diffusion, mass convection, limitations of heat and mass transfer analogy. **3**

Outcome(s): *Upon successful completion of this course, the student will be able to:*

- *Understand the basic laws of heat transfer.*
- *Analyze problems involving steady state heat conduction in simple geometries.*
- *Develop solutions for transient heat conduction in simple geometries.*
- *Understand the fundamentals of convective heat transfer process.*
- *Evaluate heat transfer coefficients for natural & forced convection.*
- *Analyze heat exchanger performance by using the method of log mean temperature difference.*
- *Analyze heat exchanger performance by using the method of heat exchanger effectiveness.*
- *Calculate radiation heat transfer between black body surfaces.*
- *Calculate radiation heat exchange between gray body surfaces.*

Text Books:

3. Nag P. K, "Heat & mass transfer", TMH, Latest Edition.

4. Holman J. P, "Heat Transfer (in SI units)", TMH, Latest Edition.

Reference Books:

4. Sachdeva R. C, "Fundamentals of Engineering Heat and Mass Transfer", New Age International Publishers, Latest Edition.

5. Fundamental of Heat and Mass Transfer by Incropera and Dewitt, Wiley Publication

6. Heat and Mass Transfer: Fundamentals and Application by Yunus Cengel, McGraw Hill

ME 14.307 **Fluid Machinery** **Total Lectures: 40**

Credit 3-0-0-3

Prerequisite(s): ME 14.204

Objective(s): *This course deals with the fluid dynamics and thermodynamics to various kinds of fluid machineries. The objectives of the course is to enable the student;*

- *To impart the knowledge on pumps and turbines.*
- *To understand the basic principles of pneumatics and hydraulics.*
- *To identify pneumatic and hydraulic components and their functions*
- *To understand different types of turbine and its applications.*
- *To compute the efficiency of different types of turbine and pumps.*

1. **Introduction:** Introduction, Application of momentum and momentum equation to flow through hydraulic machinery, Euler's fundamental equation. **[2]**
2. **Impact Of Jet:** Introduction to hydrodynamic thrust of jet on a fixed and moving surface (flat & curve), effect of inclination of jet with the surface. **[4]**
3. **Hydraulic Turbines:** Classification of turbines, Impulse turbines, constructional details, velocity triangles, power and efficiency calculations, governing of Pelton wheel. **[7]**
4. **Reaction Turbines:** Fransis and Kaplan turbines, constructional details, velocity triangles, power and efficiency calculations, degree of reaction, draft tube, cavitation in turbines, principles of similarity, unit and specific speed, performance characteristics, selection of water turbines. **[7]**
5. **Centrifugal Pumps:** Classifications of centrifugal pumps, vector diagram, work done by impellor, efficiencies of centrifugal pumps, specific speed, model testing, cavitation and separation, performance characteristics. **[7]**
6. **Positive Displacement Pumps:** Reciprocating pump theory, slip and coefficient of discharges, indicator diagram, effect and acceleration, work saved by fitting air vessels, comparison of centrifugal and reciprocating pumps, positive rotary pumps, Gear and Vane pumps, performance characteristics. **[8]**
7. **Other Machines:** Hydraulic accumulator, Intensifier, Hydraulic press, Lift and Cranes, theory of hydraulic coupling and torque converters, performance characteristics, Hydraulic ram, Jet pumps, Airlift pumps. **[5]**

Outcome(s):

- *Able to identify hydraulic problem.*
- *Able to learn any possible improvements on fluid machinery.*
- *Able to compute efficiency of various fluid machineries.*

Text Books:

1. Lal J, "Hydraulic Machines", Metropolitan book co. Pvt Ltd , New Delhi, Latest Edition.
2. Vasandhani V. P, "Hydraulic Machines: Theory & Design", Khanna Pub, Latest Edition

Reference Books:

1. Sayres A. T, "Hydraulic and Compressible Flow Turbomachines", TMH, Latest Edition
2. Sawhney G. S. "Thermal And Hydraulic Machines", PHI, Latest Edition

ME 14.311 **Design of Machine Element Practice II** **0-0-2-1**

List of Experiments

1. To design and draw according to data given Spur Gears. [2]
2. To design and draw according to data given Helical Gears. [2]
3. To design and draw according to data given Bevel Gears. [2]
4. To design and draw according to data given Worm Gears. [2]
5. To design and draw according to data given Friction Clutch. [4]
6. To design and draw according to data given different types of brakes. [4]
7. Selection and drawing of Rolling Contact Bearings. [2]
8. Design of Sliding Contact Bearings. [2]
9. Design and drawing of Crankshaft and Connecting Rod. [4]

ME 14.313 **Fluid Machinery Laboratory** **0-0-2-1**

List of Experiments

1. To study and determine the performance characteristic of a Pelton wheel. [6]

    a. To plot a graph between inlet pressure, flow rate, torque and power against speed for a set of nozzle opening.
    b. To analyze the plotted graph between inlet pressure, flow rate, torque and power against speed for a set of nozzle opening.
    c. To determine the overall conversion efficiency of fluid to mechanical energy, over a range of condition.
    d. To compare experimental results with theoretical results

2. To study and determine the performance characteristics of Francis Turbine [6]

    a. At different flow rates
    b. At different guide vane setting
    c. To determine the overall conversion efficiency of fluid to mechanical energy
    d. To compare experimental results with theoretical results

3. To study and determine the performance characteristics of Centrifugal Pump. [6]

    a. To plot a graph between head v/s flow.
    b. To plot a graph between efficiency v/s flow
    c. To study non dimensional characteristics
    d. To demonstrate Cavitations

4. To study and determine the performance characteristics of Positive displacement pumps [6]

    a. Piston pump
    b. Gear pump
    c. Vane pump
    d. Swash plate pump

ME 14.302 **Computational Methods** **Total Lectures: 40**

Credit-3-0-0-3

Prerequisite(s): Engineering Mathematics

Objective(s):

- *To solve linear systems of equations using Gaussian elimination and Gauss-Seidel iteration.*
- *To use bisection and Newton-Raphson techniques to find approximate roots of non-linear equations, and analyse the errors.*
- *To calculate approximate derivatives and finite integrals;*
- *To apply numerical techniques to solve ordinary differential equations*

1. **Solution of algebraic and transcendental equations:** fixed point iterative methods; method of iteration, order of convergence, method of bisection, regulai-falsi method, Newton-Raphson method. Roots of polynomial equation by Lobachevsky-Graeffe's method, Bairstow's method Solution of system of nonlinear equations by Newton-Raphson's method. [8]
2. **Solution of system of linear algebraic equations:** Direct methods – Gaussian elimination method, Gauss Jordan method, LU decomposition technique (Doolittle's and Crout's method), Cholesky decomposition for symmetric matrices, matrix inversion. Ill conditioned systems – condition index and condition number. Iterative methods – Gauss Seidel method, convergence of the iterative method. [8]
3. **Numerical Integration and Differentiation:** Trapeziodal, Simpson's and Romberg's methods. Degree of precision, Newton Cotes formula, composite forms, Gaussian quadrature using Legendre polynomials. [8]
4. **Curve fitting and interpolation:** Linear regression, Matrix formulation of the least square procedure for linear forms. Weighting for least square method, curve fitting with polynomials, Fourier series and exponential function. Interpolation; curve fitting and interpolation with a cubic spline. [6]
5. **Numerical solution of ODE:** solution of initial value problems by single-step and multi-step methods – Runge-Kuttamethod, Adam-Bashforth-Moulton and Millne's method. Solution of boundary value problem–Finite Difference method. Numerical solution of PDE: methods of finite difference and relaxation technique for solving elliptic and hyperbolic equations. [10]

Outcome(s):

- *Students are able to understand the different numerical methods to solve the algebraic equations and to solve system of linear and nonlinear equations*
- *An ability to apply knowledge of math, science, and engineering to the analysis of heat transfer and fluid mechanics problems.*
- *An ability to identify, formulates, and solves mechanical engineering problems.*
- *An ability to work on multidisciplinary projects*

Text Books:

1. Ghosh P, "Numerical Methods with Computer Programs in C++", PHI, Latest Edition.
2. Grewal B. S, "Numerical Methods in Engineering & Science (Programs in C, C++, Introduction to MATLAB)", Khanna Publishers Latest Edition.

Reference Books:

1. Sastry S. S, "Introductory Methods of Numerical Analysis", PHI Learning Private Limited, Fourth Edition, 2005.

ME 14.304 **I C Engines** **Total Lectures: 40**

Credit 3-1-0-4

Prerequisite(s): ME 14.203, ME 14.204, ME 14.305

Objective(s):

- *To teach students the fundamentals, operations, and performance of internal combustion engines and their different types.*
- *To provide students with the theoretical and experimental ability to operate, analyse, and design internal combustion engines.*
- *To study the thermodynamics, combustion, heat transfer, friction and other factors affecting engine power, efficiency and emissions*

1. **Introduction to I C Engine:** Two and four stroke engines, SI and CI engines, Valve timing diagram, Rotary engines, Stratified charge engine, Scavenging in 2 Stroke engines. **3**
2. **Spark Ignition Engines:** Spark ignition engine mixture requirements, Carburetion, Theory of carburetor, SP and MPFI, Combustion in SI engine, Flame speed, Ignition delay, Abnormal combustion and it's control, combustion chamber design for SI engines. **6**
3. **Compression Ignition Engines:** Combustion in CI engine, Ignition delay, Knock and its control, Combustion chamber design of CI engine, Turbocharging, Supercharging. **6**
4. **Engine Systems and Components:** Ignition systems- Battery, Magneto and Electronic, Lubrication systems, Engine starting system, Engine cooling system, Intake and exhaust system, Drive train- Cam shaft and Valves. **7**
5. **Pollutant Formation Control:** Pollutant, Sources and types, Nox formation, Hydrocarbon emission mechanism, Carbon monoxide formation, Particulate emissions, Effect of pollutant, Emission standards, Catalytic converters and particulate traps, Method of measurement **7**
6. **Alternate Fuels:** Methanol, Ethanol, Hydrogen, Natural gas, Biogas, Bio diesel, Liquefied petroleum gas, Properties, suitability, Engine Modifications, Merits and Demerits. **5**
7. **Performance Characteristic and Testing of I C Engine:** Standards for testing of I.C. Engine, Mean effective pressure, Mean effective pressure, indicated power, brake power, friction power, Methods to determine power and efficiencies, Variables affecting performance of engine, characteristic curves, heat balance sheet, Methods of improving engine performance. **6**

Outcome(s): *Upon successful completion of this course, the student will be able to:*

- *Demonstrate a basic understanding of different types of internal combustion engines and their operations.*
- *To analyze the ideal models of engine cycles.*
- *To understand the effect of supercharging and turbocharging on engine performance.*
- *To understand fuel-metering systems: carburetors and fuel injectors, in SI and CI engines.*

Text Books:

1. Ganesan V, "Internal combustion Engines", Tata McGraw Hill Pub. Co. Ltd., 3rd Edition, 2007.
2. Heywood John B, "Internal combustion Engines Fundamentals", McGraw Hill, Latest Edition.

Reference

1. Mathur M. L and Sharma R. P, "Internal Combustion Engines", Dhanpat Rai & Sons, Latest

Books:

Edition.

2. Pulkrabek W. W, “Engineering Fundamentals of the Internal Combustion Engine”, PHI Learning Private Limited, Latest Edition.

ME 14.306 **Production Technology-II** **Total Lectures: 40**

Credit: 3-0-0-3

Prerequisite(s): ME-14.205, ME14.112

Objective(s):

- *To understand the basic principles of metal forming, welding and casting processes*
- *To know the various types of melting practices*
- *To broaden the understanding of casting design principles*

1. **Metal Forming:** Nature of plastic deformation, stress-strain relation inelastic and plastic deformation, concept of flow stress, deformation mechanism, hot and cold working, rolling principal, rolling stand arrangement, roll passes, sheet metal working processes bending, bend force, , press work tool and types of dies. **[12]**
   Forging, Extrusion and other Processes: Forging operations, forging design, drop forging die design, die inserts; Extrusion-principle, forward and backward extrusion, impact extrusion, hydrostatic extrusion, extruding tubes Wire drawing- rod and tube drawing, tube making, swaging.
2. **Metal Fabrication Process:** introduction to fabrication process, gas welding and cutting. Electric arc welding-principle of arc, arc welding equipment, electrodes, carbon arc welding, TIG GMAW, SAW, arc cutting Resistance welding: principle –spot, seam, projection, upset, flash welding Other welding process: Thermit welding, electro slag welding, EBW, laser beam welding, forge welding, friction welding, diffusion welding, explosion welding, Welding design: heat input, heat flow, distortion, metallurgy of welding, defects in welding, brazing, braze welding and soldering **[14]**
3. **Metal Casting Process:** Introduction-advantages and limitations-applications-casting termsPatterns: Pattern allowance-pattern materials-types of patterns- colour codes Moulding materials: Moulding sand composition-testing sand properties-sand preparation-moulding sand properties-types of sand moulds-moulding machines Cores: Core sand, types of cores, core prints, chaplets, forces acting on the moulding flasksGating system: Elements of gating system, gates, pouring time, sprue, gating ratio, slagtrap system, risering design-caine's method, modulus method, chills-feeding aids. **[14]**

Outcome(s):

- *Student will be able to*
- *Choose forming techniques for various applications*
- *Develop welding techniques for various alloys*
- *Develop welding application concepts*
- *Develop suitable casting techniques for specific applications*
- *Design of gates and risers in castings*

Text Books:

1.Rao P. N, "Manufacturing Technology", Tata McGraw-Hill, Latest Edition.
2.Lindberg Roy A, "Processes and Materials of Manufacture", Fourth edition PHI Latest Edition.

Reference Books:

1. Ostwald P. F, "Manufacturing Processes and Systems", John Wiley and Sons, ninth edition 1998.
2. Kalpakjian, S. and Steven R. Schmid , Manufacturing, Engineering & Technology, Pearson
3. Mikell. P. Grover, Fundamentals of Modern Manufacturing, Pearson Publications

ME 14.308 **Metrology & Quality Control** **Total Lecture: 40**
Credit: 3-0-0-3

Prerequisite(s) ME 14.215

Objective(s):

- *Describe various instruments and their characteristics.*
- *Solve the problems on angle measurements.*
- *Explain the types of control chart to use, depending on given data.*
- *Solve problems based on quality control and acceptance sampling*.

1. **Introduction to Metrology:** Need – Elements – Work piece, Instruments – Persons – Environment – their effect on Precision and Accuracy – Errors – Errors in Measurements. [4]
2. **Linear and Angular Measurements:** Linear Measuring Instruments – Vernier micrometers, Limit gauges, height and depth gauge as per Indian standards ,Limit gauges – terminology – procedure – concepts of interchange ability and selective assembly – Angular measuring instruments – Types – Bevel protractor ,clinometers, angle gauges, spirit Levels, sine bar – Angle alignment telescope – Autocollimator – Applications. [8]
3. **Form Measurement:** Principles and Methods of straightness – Flatness measurement – Thread measurement, Gear measurement, Interferometry, Types of Interferometer, Flatness, Roundness measurement - Applications. Control Gauges and Comparators. Surface texture measurement with stylus type instruments, Tomlinson surface meter, Talysurf and profilograph. [8]
4. **Advances in Metrology:** Straightness – Alignment, Basic concept of CMM –Types of CMM – Constructional features – Probes – Accessories – Software – Applications –Basic concepts of Machine Vision System – Element – Applications. [4]
5. **Quality Control:** Concept of Quality and quality control, elements of quality & its growth, purpose, setup, policy & objective, factors controlling & quality of design and conformance, balance between cost and quality and value of quality. Specification of quality, planning through trial lots and for essential information [5]
6. **Statistical Quality Control:** Importance of statistical method in quality control, measuring of statistical control variables and attributes. Measurement/inspection, different types of control charts (X Bars, R, P. charts) and their constructions and their application. [6]
7. **Acceptance Sampling:** Sampling inspection & percentage inspection, basic concept of sampling inspection, operating characteristic curves, conflicting interests of consumer and producer, producer and consumers risks, AWQL, LTPD, ADGL, single and double sampling plans. [5]

Outcome(s): *After successful completion of this course the student will be able to:*

- *Make various comparative measurements.*
- *Understand fundamentals of gears, thread measurements and measurements of surface finish.*
- *Control chart techniques in quality control.*
- *Purpose and use of sampling and its benefit*.

Text Books:

1. Metrology and Measurement, Anand Bewoor & Vinay Kulkarni McGraw – Hill
2. Statistical quality Control – Mahajan M., Dhanpat Rai & Sons, Delhi.

Reference Books:

1. Jain R. K, "Engineering Metrology", Khanna Publishers, Latest Edition.
2. Gupta I. C, "Engineering Metrology", Dhanpatrai Publications, Latest Edition
3. Shotbolt, "Metrology for Engineers, McGraw Hill, Latest Edition.
4. Dale H. Besterfield, Carol Besterfield-Michna, Glen H. Bester field and Mary Besterfield, "Total Quality Management", 3rd Edition; Pearson Education.
5. Montgomery, Introduction to Statistical Quality Control, John Wiley and Sons (2005).

ME 14.320 **Optimization Methods in Engineering Design** **Total Lectures 40**
Credit 3-1-0-4

Prerequisite(s) ME 14.101

Objective(s)

- *Demonstrate an understanding of how design optimization fits into the overall design process.*
- *Learn how to formulate practical engineering design problems as well-posed optimization problems.*
- *Understanding continuous optimization theory for problem formulation and system modeling*
- *Develop a detailed understanding of numerical methods for optimization through implementation in MATLAB*

1. **Introduction to Design Optimization:** Design Process, conventional v/s optimum design, Optimum design v/s optimal control. [2]

2. **Optimum Design Problem formulation**: The problem formulation process with examples, General Mathematical model for optimum Design. [4]

3. **Graphical Optimization and Basic Concept**: Graphical solution process, Use mathematical and MATLAB for Graphical optimization, Design problem with multiple solutions. [6]

4. **Optimum Design Concepts:** Local and Global minima, Optimality Conditions- Unconstrained problem, Optimality Conditions for functions of single variable and for functions of several variables, Necessary conditions for equality constrained problems, Lagrange multiplies, Necessary condition for a general constrained problem, Karush-kuhn – tucker necessary condition, Global optimality- Convex sets, convex functions, convex programming problems, Engineering design Examples [6]

5. **Numerical Methods for continuous Variable Optimization:** Classification of search methods, simple scaling of variables, Excel solver for unconstrained optimization problems, Excel solver for nonlinear programming, optimum design examples with MATLAB. [5]

6. **Linear programming methods for optimum design:** Linear functions, Standard linear programming problems, optimum solution to L.P. problems, calculation of basic solutions, simplex method, Duality in linear programming, KKT conditions for LP problems. [6]

7. **Numerical method for unconstrained optimum Design:** Gradient- based and Direct search methods, step size determination, Numerical method to determine slip size, search direction determination, other conjugate gradient methods. [6]

8. **Numerical Methods for constrained optimum Design:** Basic concepts, Constrains Status at a design point, Constraint Normalization, The descent function, Linearization of the Constrained problem, sequential linear programming algorithm, Sequential quadratic programming, the constrained steepest descent method. [5]

Outcome(s)

- *Model and formulate optimization problems in standard form and assess the optimality of a solution.*
- *Construct computer programs to determine the optimal solution for unconstrained and constrained nonlinear optimization problems of multiple variables.*
- *Determine the advantages and disadvantages of applying different optimization techniques for a specific problem.*
- *Model and analyze multiobjective and multidisciplinary optimization problems.*

Text Books:

1. Arora, J. S, "Introduction to Optimum Design", McGraw-Hill, Latest Edition.
2. Rao S. S, "Engineering optimization: Theory and practice", John Wiley & Sons Inc, Latest Edition.

1. Vanderplaats G. N, "Numerical Optimization Techniques for Engineering Design", McGraw-Hill, Latest Edition.
2. Miller, R. E, "Optimization: Foundations and Applications", John Wiley & Sons Inc, Latest Edition.
3. Fletcher R, "Practical Methods of Optimization", Wiley, Latest Edition.
4. Gill P. E, Murray W., & Wright M., "Practical Optimization", Academic Press, Latest Edition.
5. Nocedal J & Wright S. J, "Numerical Optimization", Springer-Verlag Latest Edition.

ME 14.322 **Vibration Engineering** **Total Lectures: 40**

Credit: 3-1-0-4

Prerequisite(s): ME 14.301, MA 14.201

Objective(s):

- *Formulate mathematical models of problems in vibrations using Newton's second law or energy principles.*
- *Perform detailed analysis of the response of one and two degree of freedom systems in both free and forced vibration regimes.*
- *Explain the interaction of mechanical vibrations with humans.*
- *Perform vibration design of simple mechanical systems that can be approximated by one, two, or infinite degree of freedom systems.*

1. **Introduction:** Basic Concept, Classification of vibrations and vibrating systems, Oscillating motion like harmonic motion, periodic motion and vibration terminology. **2**
2. **Free vibration of single degree-of-freedom system:** Vibration model, Equation of motion, natural frequency, viscously damped free vibration, Logarithmic decrement, Coulomb damping. **10**

   Harmonically forced vibration of single degree-of-freedom system: Forced harmonic vibration, vibration isolation, rotating unbalance, whirling of rotating shaft, support motion, Structural damping.
3. **Two Degree Freedom systems:** Introduction, Principal modes, Double pendulum, Torsional system with damping, coupled system, undamped dynamic vibration absorbers **6**
4. **Multi-degree-of-freedom system:** Free vibration of undamped systems, Torsional systems, Co-ordinate coupling and principal Co-ordinates, forced vibration of damp free and damped systems **8**
5. **Numerical technique to find Natural frequencies:** Rayleigh's method, Horzer's method, Matrix Iteration method, energy method. **8**
6. **Vibration analysis of continuous system:** Transverse vibration of strings, longitudinal vibration of rods, Torsional vibration of shafts, transverse vibration of beams. **6**

Outcome(s):

- *Ability to analyze the mathematical model of a linear vibratory system to determine its response.*
- *Ability to solve for the motion and the natural frequency for free and forced vibration of a single degree of freedom damped or undamped system.*
- *Ability to obtain linear mathematical models of real life engineering systems*
- *Ability to solve vibration problems that contain multiple degrees of freedom.*

Text Books:

1. S.Bhave, Mechanical Vibration, Pearson India Ltd., Latest Edition.
2. G. K. Groover, Mechanical Vibrations, Jain Brothers, Roorkee.

Reference Books:

1. S. S. Rao, Mechanical Vibrations, Pearson-Prentice Hall, Latest Edition.
2. T. Thomson, M.D. Dahleh, P. Chandramouli, Theory of vibration with application, PHI Latest Edition.

ME 14.324 **Advanced Metal Casting & Welding** **Total Lectures: 40**

Pre – requisites: *ME 14.306* **Credit: 3-1-0-4**

Objective:

- *To make the students understand the concepts of advance casting technique.*
- *To make the students understand the concepts of advance welding technique.*
- *To make the students understand the principles and operations of special and modern welding processes*

1. **Advanced Casting :** Processes, parameters and applications of Investment Casting, Continuous Casting, Centrifugal casting, Carbon dioxide molding, Shell Moulding, Gravity die/ permanent mold casting, pressure die casting, Resin bonded casting , plaster mold casting, Vaccum Casting, Full Mould Casting, Slush Casting, Non metal Molding /Ceramic Molding. [10]

2. **Inspection and Testing of Casting:** Defects in Casting, its causes and remedies, Inspection and Destructive and nondestructive Testing of Casting including. [4]

3. **Advanced Welding Technique-I:** Electron Beam Welding- Background of the Process, Weld Environment, Welding in Different Degrees of Vacuum, Equipment and Safety, Joint Design, Applications, Laser Beam Welding, Process Parameters, Applications and Limitations. Plasma arc welding: Theory and Principles, Transferred arc and Non-Transferred arc Techniques, Equipment and Tooling, Joint Design Advantages, Disadvantages. [10]

4. **Advanced Welding Technique-II**: Ultrasonic Welding; Propagation of ultrasonic waves in matter, mode of joint formation, joint types and design of product for ultrasonic welding, details of equipment. Friction Welding- Basic Principles, Process Variants, Different Stages of Friction Welding, Mechanism of Bonding, Influence of Process Parameters, Weld Quality and Process Control, Joining of Dissimilar Materials, Advantages, Limitations and Applications. Diffusion Welding- theory and Principle of Process, Key Variables, Intermediate Materials, Deformation Welding, Equipment and Tooling. [10]

5. **Thermal and Metallurgical Consideration.** Thermal considerations for welding, temperature distribution, Analytical analysis, heating & cooling curves. Metallurgical consideration of weld, micro & macro structure. Solidification of weld and properties. [6]

Outcome: *Student will be able to*

- *Develop advanced casting techniques for various alloys*
- *Develop advanced welding techniques*
- *Develop welding application concepts*

Text Books:

1. Khanna O.P., "Foundry Technology", Latest Edition, Dhanpat Rai *Publication*

2. Khanna O.P., "Welding Technology", Latest Edition, Dhanpat Rai *Publication*

3. Howard B Cary, " Modern Welding Technology" Prentice Hall, 2002

Reference Books:

1. Richard L Little, “Welding and Welding Technology” Tata McGraw Hill, 2004.
2. Kalpakjian, S. and Steven R. Schmid , Manufacturing, Engineering & Technology, Pearson
3. Mikell. P. Grover, Fundamentals of Modern Manufacturing, Pearson Publications

ME 14.326 **Power Plant Engineering** **Total Lectures: 40**

Credit 3-1-0-4

Prerequisite(s): ME 14.203, ME 14.204

Objective(s):

- *Basic knowledge of Different types of Power Plants, site selection criteria of each one of them.*
- *Understanding of Thermal Power Plant Operation, turbine governing, different types of high pressure boilers including supercritical and supercharged boilers, Fluidized bed combustion systems.*
- *Basic knowledge of Different types of Nuclear power plants including Pressurized water reactor, Boiling water reactor, gas cooled reactor, liquid metal fast breeder reactor.*
- *Understanding of Power Plant Economics, Energy Storage including compressed air energy and pumped hydro etc.*
- *Discussing environmental and safety aspects of power plant operation.*

1. **Introduction:** Power and energy, sources of energy, review of thermodynamic cycles related to power plants, fuels and combustion, calculations. Variable Load problem Industrial production and power generation compared, ideal and realized load curves, terms and factors. Effect of variable load on power plant operation, methods of meeting the variable load problem, Power plant economics and selection, Effect of plant type on costs, rates, fixed elements, energy elements, customer elements and investor's profit; depreciation and replacement, theory of rates. Economics of plant selection, other considerations in plant selection. **8**
2. **Steam Power Plant:** General layout of steam power plant. Different systems such as fuel handling system, pulverizes and coal burners, combustion system, draft, ash handling system, feed water treatment and condenser and cooling system, turbine auxiliary systems such as governing, feed heating, reheating flange heating and gland leakage. Operation and maintenance of steam power plant, heat balance and efficiency. **8**
3. **Hydro Electric Power Plant:** Hydrology: rainfall, runoff, hydrographs, flow duration curves; Site selection for hydro power plants; Classification of hydro power plants; Storage type hydro power plant and its operation; Estimation of power availability; Selection of water turbines; Combination of hydro power plants with steam plants; advantages and disadvantages of hydro power points. **8**
4. **Internal and External Combustion Engine Power Plants:** General layout, performance of diesel engine, Diesel plant operation and efficiency, Gas turbine power plant, Elements of gas turbine power plants, Gas turbine fuels, cogeneration, auxiliary systems such as fuel, controls and lubrication, operation and maintenance, Combined cycle power plants. **8**
5. **Nuclear Power Plant:** Basic theory and terminology; Nuclear fission and fusion processes; Fission chain reaction; Moderation; Fertile materials; Nuclear fuels; General components of nuclear reactor; Different types of reactors; Breeder reactors; Nuclear power plants in India; Disposal of nuclear waste. **8**

Outcome(s): *After taking this course the students should be able to:*

- *Select the suitability of site for a power plant.*
- *Calculate performance of thermal power plant.*
- *Propose ash handling, coal handling method in a thermal power plant.*
- *Explain working principle of different types of nuclear power plant.*
- *Calculate load factor, capacity factor, average load and peak load on a power plant.*
- *Indicate safety aspects of power plants.*

Text Books:

1. Nag P. K, “Power Plant Engineering”, Tata McGraw Hill Publishing Company Ltd., New Delhi, Latest Edition.
2. Yadav R, “Power Plant Engineering”, Central Publishing House, Latest Edition.

Reference Books:

1. El Wakil M. M, “Power Plant Engineering”, McGraw Hill Latest Edition
2. Bernhardt G. A. S & William A. V, “Power station Engineering and Economy”, Tata Mc Graw Hill Publishing Company Ltd., New Delhi, Latest Edition.

ME 14.328 **Turbomachinery** **Total Lectures: 40**

3-1-0-4

Prerequisite(s): 14.204

Objective(s):

- *Teach students how to apply various understandings from other courses;*
- *Provide students with opportunities to apply basic flow equations;*
- *How to compare and chose machines for various operations*.

1. **Introduction:** Basic law and equations, dimensional parameters and their physical significance and specific speed. **5**
2. **Energy Transfer in Turbomachine:** General analysis of a turbomachine, energy transfer between fluid and rotor, degree of reaction. **7**
3. **Centrifugal Fans and Blowers:** Types, stage and design parameters, flow analysis in impeller blades, volute and diffusers, losses, characteristic curves and selection, fan drives and fan noise. **8**
4. **Centrifugal Compressor:** Construction details, impeller flow losses, slip factor, diffuser analysis, and losses, performance curves. **6**
5. **Axial Flow Compressor:** Stage velocity diagrams, enthalpy-entropy diagrams, stage losses and efficiency, work done, simple stage design problems and performance characteristics.[**8**
6. **Axial and radial flow turbines:** Stage velocity diagrams, reaction stages, losses and coefficients, blade design principles, testing and performance characteristics. **6**

Outcome(s): *Upon successful completion of this course, the student will be able to:*

- *Classify and explain the function of dimensionless number;*
- *Design Prototype from Model;*
- *Select Fluid Machines for Appropriate Operations;*
- *Applications of Thermodynamics Laws.*
